INTRODUCTION

IT IS A PLEASURE to announce that the present *Britannica Book of the Year* is available to Britannica subscribers in March—two months earlier than it has ever been before. This has been accomplished in spite of the fact that the enormous increase from year to year in the distribution of the volume has extended the period of production, even with presses running at capacity.

Subscribers wished to secure the volume earlier in the year. And it was recognized that this could be done without impairing the book's value by advancing the closing date for the bulk of the material. Coverage of the present volume closes with November 1, and the following years' issues will cover the twelve months from November to November.

The pattern of the year's events is largely set by the time November rolls around. The U.S. government's fiscal year ends June 30, and in many other areas of interest the statistical year's span closes long before January 1. However, as in the past, the Calendar of Events and the Obituary List will continue to include items from January 1 to January 1. These two listings and the coverage of the November election results were the last material sent to the printer in 1952.

* * * * *

This sixteenth issue of the *Book of the Year* was made possible by not only its six hundred and more authoritative contributors but by the splendid co-operation of that portion of the Encyclopædia Britannica permanent editorial staff which bears the burden of *Book of the Year* production.

Among subeditors who checked for accuracy and prepared copy for the printer were: Melvina G. Hilland, Kathleen Ray, Daphne M. Daume, Joyce M. Usher, Ruth D. Asch, Olive S. Ricklefs, and Judith Miller. Others active in the work were indexers: Mildred W. Benson, Claire E. Drullard and Joan E. Stephenson; the copy control section which checked flow of copy to and from the printer: Felicité Buhl, Frances E. Latham and Katherine E. Van Milligan; Alice Toth, who prepared correspondence with contributors, assisted by Paula Buchwald and Donna Greenspahn; Joan Sayler, who helped lay out the pages of the volume; general editorial assistants Donald E. Stewart, Philip W. Goetz, and Russell Mahood; the geographer, Myldred Dingwall; map and chart maker, Victor Figueroa; typists: Florence S. Samuelson, Ruth S. Bicking, and Rita M. Trojan.

The work of this staff was under the general management of Mae H. MacKay and her two associates, Harriet Milburn and Lorene Lawson.

WALTER YUST

EDITORS AND CONTRIBUTORS

WALTER YUST, *Editor of Encyclopædia Britannica and of the Britannica Book of the Year*

HOWARD E. KASCH, *Associate Editor of the Britannica Book of the Year*

RUTH SOFFER, *Picture Editor*

CALENDAR OF EVENTS • 1952

JANUARY

1 Iranian Premier Mohammed Mossadegh indicated approval of offer of International Bank for Reconstruction and Development to try to reach temporary solution of Iranian oil crisis.

Canadian government reported that Canada had produced \$1,228,000,000 worth of strategic and other minerals in 1951.

Egyptians opened fire on British positions in the curfew area of Ismailia, Suez Canal Zone.

2 Pres. Harry S. Truman submitted to congress plan to reorganize bureau of internal revenue under which the 64 politically appointed collectors would be replaced by 25 civil service district commissioners.

U.S. supreme court ruled that evidence forcibly extracted from stomach of prisoner could not be used to convict him.

U.S. state dept. disclosed suggestion to Great Britain and Egypt that King Farouk be recognized as king of the Anglo-Egyptian Sudan if Egypt joined middle east defense command.

3 U.N. plan for man-for-man exchange of prisoners of Korean war was rejected by Communist truce delegation.

Soviet Foreign Minister Andrei Y. Vishinsky proposed that Korean truce situation be studied by U.N. Security council.

Burma became a member of the International Monetary fund and the International Bank for Reconstruction and Development.

4 United Steelworkers of America, C.I.O., postponed for 45 days nation-wide steel strike pending Wage Stabilization board proceedings.

Pres. Getulio Vargas of Brazil decreed that foreign companies would be allowed to repatriate only the registered capital taken into Brazil plus 8% interest.

5 India and the U.S. signed agreement in New Delhi providing for \$50,000,000 in technical economic aid during next 5 years.

U.S.S.R.'s official entry was

made in the 15th Olympic games at Helsinki in the summer of 1952.

6 Defense Mobilization Director Charles E. Wilson in 4th quarterly report stated that U.S. defense achievements in 1951 had been tremendous with relatively little dislocation to the civilian economy.

7 French Premier René Pleven resigned after defeat in national assembly, 341 to 243.

President Truman accepted resignation of W. Stuart Symington as administrator of Reconstruction Finance Corp.

U.S. supreme court unanimously upheld lower court rulings that International Longshoremen's and Warehousemen's union must pay \$750,000 in damages for jurisdictional strike in violation of Taft-Hartley act.

8 Second session of the U.S. 82nd congress convened in Washington, D.C.

Heavy ground fighting broke out west of Korangpo on the western Korean front.

9 Pres. Harry S. Truman and British Prime Minister Winston Churchill promised in joint communiqué that U.S. and British policies in Europe and the middle and far east would be unified as nearly as possible.

President Truman in annual state of the union message to congress urged continued defense production, continued foreign aid, tax increases and passage of his civil rights program.

Belgian Premier Joseph Pholien resigned following criticism of his economic policy by his own Christian Socialist party.

U.S. government was revealed to have proposed to the U.S.S.R. that dispute over World War II lend-lease debt be taken to the International Court of Justice.

10 Adm. Raymond A. Spruance was nominated as U.S. ambassador to the Philippines and Harry A. McDonald as administrator of Reconstruction Finance Corporation.

Freighter "Flying Enterprise" sank within 50 mi. of southwest coast of England after heroic attempt by Capt. Henrik K. Carlsson to save it.

President Truman stated that Atty. Gen. J. Howard McGrath

would head campaign to eliminate corruption in the federal government.

Malcolm MacDonald, U.K. commissioner general in southeast Asia, revealed plans to defend, in case of attack, the whole of Malaya and British Borneo.

11 Communist truce delegates flatly refused to negotiate over the right to build airfields in North Korea.

West German bundestag ratified, 232 to 143, the Schuman plan for merging European steel and coal industries.

U.N. general assembly voted, 42 to 5 (7 abstaining), to set up the 12-nation Disarmament commission consisting of Security council members and Canada.

12 Iranian government demanded in note to Great Britain that all British consulates in Iran be closed.

U.S. Navy Secy. Dan A. Kimball revealed navy plans to seek authority to build one aircraft supercarrier each year for 10 years.

13 White House announced that at Gen. Mark W. Clark's request President Truman would not resubmit to senate Clark's nomination as U.S. ambassador to the Vatican.

Gen. Alphonse-Pierre Juin stated in Washington, D.C., that the French would need U.S. and British aid to resist major Chinese Communist attack in Indochina.

14 William H. Draper, Jr., was nominated as President Truman's special representative in Europe with rank of ambassador.

15 Gen. Sir Gerald Templer was named British high commissioner in Malaya to direct campaign against Communist guerrillas.

Jean Van Houtte replaced Joseph Pholien as head of Belgium's all-Christian Socialist government.

16 Queen Narriman of Egypt gave birth to a son, Ahmed Fuad, who became heir to the Egyptian throne.

President Truman in economic report to congress requested increase in taxes of at least \$4,300,000,000 to \$4,500,000,000.

Soviet government ordered foreign diplomats to stay within 25 mi. of Moscow and barred them from 22 other cities.

British troops surrounded and searched villages of Tel el-Kebir and El Hammada in the Suez Canal Zone.

17 Prime Minister Churchill in speech to joint session of U.S. congress emphasized that the purpose of his visit was to obtain equipment, rather than money, for Britain.

18 Edgar Faure was confirmed as French premier by national assembly's vote of 401 to 101.

White House revealed that British Prime Minister Churchill had agreed to the designation of a U.S. admiral as supreme allied commander in the Atlantic ocean area.

19 U.N. general assembly endorsed its trusteeship committee's resolution urging South Africa to place South-West Africa under the U.N. trusteeship system.

20 British troops occupied a large part of the town of Ismailia in the Suez Canal Zone.

21 President Truman sent to congress largest U.S. peacetime budget, estimating expenditures at \$85,444,000,000 and revenue at \$70,998,000,000 in the fiscal year beginning July 1, 1952.

International Business Machines Corp. was charged with monopolizing the tabulating industry in a civil antitrust complaint filed by justice dept.

22 U.N. Secy.-Gen. Trygve Lie reported that 16 nations in addition to the U.S. had sent armed units to Korea.

23 Withdrawal of U.S. military aid from Iran was announced because of that country's failure to conform to the provisions of the Mutual Security act.

24 Appointment of Vincent Massey as the first native-born governor general of Canada was announced from Buckingham palace in London.

U.N. headquarters in Tokyo reported that truce negotiations in Korea had reached a state of complete paralysis.

State of emergency was declared by King Tribhubana of Nepal following 48-hour revolt by leftist Raksha Dal organization.

For elections and disasters of 1952, see under those headings in the text. For obituaries of prominent persons who died during 1952, see under the entry Obituaries.

JANUARY—Continued

25 British troops rounded up all Egyptian auxiliary police in Ismailia, Suez Canal Zone.

26 All of Egypt was placed under martial law after mobs had wrecked many British, U.S. and French business places in Cairo.

27 U.N. truce delegation presented Communists with full allied terms for truce and proposed meeting of General Matthew B. Ridgway and Chinese and North Korean commanders.

King Farouk I of Egypt replaced Premier Nahas Pasha's Wafdist cabinet with an independent government headed by Aly Maher Pasha.

28 U.S., British and French governments warned that they would call for U.N. action to meet any new Communist attack in southeast Asia.

U.S. government granted the U.K. \$300,000,000 in Mutual Security aid funds to support its defense program.

Pres. Harry S. Truman in message to congress renewed appeal for approval of construction plans for the St. Lawrence Seaway and Power project.

29 British Chancellor of the Exchequer R. A. Butler outlined imposition of drastic new economies to house of commons.

Prime Minister Churchill announced appointment of Field Marshal Viscount Earl Alexander, retiring governor general of Canada, as defense minister in the British cabinet.

30 Adm. Lynde D. McCormick of the U.S. navy was named supreme allied commander in the Atlantic ocean area.

31 Princess Elizabeth and the duke of Edinburgh left London by air for Nairobi, Kenya, on first stage of projected visit to Australia and New Zealand.

FEBRUARY

Newbold Morris of New York accepted assignment to investigate corruption in the federal government.

U.N. general assembly rejected soviet proposal that 14 appli-

cants for U.N. membership, including 5 soviet satellites, should be approved as a group.

Argentine shore patrol fired upon British survey vessel arriving at Hope bay, Antarctica.

2 U.N. general assembly endorsed resolution urging return of Greek children from Cominform countries where they were taken during Greek civil war.

3 U.S. house appropriations subcommittee reported possibility of recovery by U.S. government of millions of dollars lost by Commodity Credit corporation through illegal conversion of grain by private warehouses.

4 Iranian government ordered the closing of all foreign cultural institutions in the country outside of Tehran.

Defense Secy. Robert A. Lovett told U.S. senate subcommittee that defense request for \$52,000,000,000 in fiscal year 1953 was \$19,000,000,000 less than that recommended by joint chiefs of staff and that any further reduction would be imprudent.

5 U.N. general assembly adjourned in Paris after voting to postpone discussion of a permanent settlement of the Korean question.

Pres. Harry S. Truman advised congress that he had authorized use of \$478,160,000 in military funds under Mutual Security act for economic aid to France, Greece, Turkey, the U.K. and Yugoslavia.

6 King George VI of the United Kingdom died unexpectedly; his elder daughter was proclaimed Queen Elizabeth II by the privy council.

Soviet Union vetoed for the 5th time Italy's application for U.N. membership.

Communist truce negotiators proposed that a major peace conference should be convened after an armistice in Korea to deal with other major far eastern disputes besides the Korean conflict.

Argentine government revealed arrest of 100 persons, including a former army chief of staff, as plotters against the Perón regime.

7 Former Gov. Ellis G. Arnall of Georgia was named

director of the Office of Price Stabilization.

George F. Kennan was nominated as U.S. ambassador to the U.S.S.R.

8 Spanish government in note to U.S. state dept. expressed displeasure at remarks pronouncing dislike for the Franco regime made by President Truman at a press conference the day before.

Italian government advised the U.S.S.R. that the latter's veto of Italy's application for U.N. membership violated the 1947 peace treaty and in effect relieved Italy of any further obligations under it.

9 Communist proposal for general post-truce political conference was rejected by Vice Adm. Charles T. Joy, chief U.N. negotiator in Korea.

Prime Minister Jawaharlal Nehru's Congress party was revealed to have won control of house of the people, lower house of Indian parliament, in elections which began late in 1951.

10 Retiring Price Stabilizer Michael V. DiSalle appointed committee to study the advisability of ending federal price controls on some items.

11 Newark, N.J., airport was closed after three major aeroplane crashes in less than 2 months.

George W. Taylor was named by the C.I.O. to be arbitrator of all C.I.O. jurisdictional disputes.

President Truman asked congress to strengthen the Defense Production act and to extend it for 2 years beyond the June 30, 1952, expiration date.

12 General Ridgway protested seizure by soviet forces of about 200 Japanese fishing vessels off northern coast of island of Hokkaido.

13 President Truman reported to congress that U.S. military and economic aid during past 2 years had revived west European defenses to degree where any invasion would meet determined resistance.

14 Egyptian government in note to 15 nations expressed regret over losses suffered during riots in Cairo in Jan. 1952.

Presidential emergency board recommended granting of union

shop and mandatory dues check-off in any agreement between U.S. railroads and 17 railroad labour unions.

President Truman requested congress to give Newbold Morris power to subpoena witnesses and documents in his investigation of corruption in the U.S. government.

15 King George VI of the United Kingdom was buried with traditional ceremony in St. George's chapel, Windsor.

Hosseini Fatemi, leading aide to Iranian Premier Mossadegh, was shot and seriously wounded near Tehran by an assailant said to be a Moslem fanatic.

16 Jordan signed the Arab collective security pact already signed by the 6 other members of the Arab league.

17 British Prime Minister Churchill announced that an atomic weapon produced in the U.K. would be tested in Australia during 1952.

18 Iraqi government and Iraq Petroleum company agreement providing for equal division of oil profits received royal assent after being approved by the Iraqi parliament.

19 President Truman asked congress to renew for the duration of the national emergency, and 6 months thereafter, wartime powers that would expire upon the effective date of the Japanese peace treaty.

John Carter Vincent, foreign service officer, was completely cleared by U.S. state dept.'s loyalty and security board.

U.N. and Communist truce delegations agreed to recommend to their governments that a political conference be held within 90 days after an armistice to discuss withdrawal of foreign troops and "peaceful settlement of the Korean question, etc."

U.S., U.K., French and west German foreign ministers announced agreement on outstanding issues concerning western German rearmament.

FEBRUARY—Continued

20 President Truman created commission headed by Lt. Gen. James H. Doolittle to study airport sites and safety, welfare and peace of mind of residents near airfields.

U.N. truce delegates repeated their rejection of the U.S.S.R. as a neutral supervisor of an armistice in Korea.

U.S. Secy. of State Dean Acheson at opening of 9th session of North Atlantic Treaty council defined the job of the session as one of translating decisions into action.

21 Prime Minister Churchill submitted to parliament White Paper estimating British defense expenditures during the fiscal year 1952-53 at £1,462,200,000, of which £85,000,000 would come from U.S. aid.

South Korean marines drove off 2-day Communist attempt to recapture island of Yangdo off northeastern Korean coast.

Rioting broke out in Dacca, East Pakistan, in protest against Pakistani government's decision to make Urdu Pakistan's only official language.

British government announced abolition of personal identity cards required to be carried since the outbreak of World War II.

22 U.S.-Mexican negotiations on U.S. military aid for Mexico were suspended.

Libyan authorities arrested and deported Beshir Bey Sadaawi, leader of antiwestern opposition Congress party, and some of his followers.

Steven J. L. Hardie, chairman of Britain's nationalized iron and steel industry, resigned in protest against impending government decision to raise steel prices.

British military authorities lifted restrictions on daytime passage by road in and out of the Suez Canal Zone.

North Atlantic council meeting at Lisbon approved report

setting out principles of the European Defense Community.

23 Wage Stabilization board exempted employee pension and profit sharing plans from wage controls.

Indonesian Premier Sukiman and his cabinet resigned as result of differences over acceptance of U.S. aid under the Mutual Security act.

24 North Atlantic council stated in communiqué that member nations would provide about 50 divisions in 1952 as well as 4,000 operational aircraft and strong naval forces.

Commerce Secy. Charles Sawyer announced that 10 western European nations had joined the U.S. in a multilateral arrangement to increase effectiveness of controls on exports of strategic goods to Communist-dominated areas.

French forces in Indochina reported withdrawal from Hoa Binh, a strongpoint 40 mi. west of Hanoi.

25 U.S. House Speaker Sam Rayburn (Dem., Tex.) held that house rules forbade use of television, newsreel cameras and tape recordings at house committee hearings.

U.S. court of appeals unanimously upheld convictions of Julius and Ethel Rosenberg of death sentences imposed upon them for transmitting atomic secrets to soviet agents.

6th winter Olympic games closed at Oslo with Norway winning 7 out of 22 championships.

26 U.S., British and French governments announced full agreement with western Germany on latter's financial contributions to west European defenses.

Prime Minister Churchill advised house of commons that the U.K. had developed its own atomic bomb and had the plant to insure regular production.

27 U.S. senate voted 45 to 44 to return to committee bill providing for statehood for Alaska.

Japan and the U.S. signed a military base administrative agreement providing for maintenance of U.S. air, naval and army bases in Japan.

Agreement providing for U.S.

grant-in-aid to Israel of \$50,000,000 was signed at Tel Aviv.

U.N. headquarters in Tokyo characterized Communist germ warfare charges as a camouflage for epidemics suffered by Communist troops in Korea.

28 Paul A. Walker was promoted to chairmanship of Federal Communications commission and Robert T. Bartley of Texas was named a member of the commission by President Truman.

29 Government of French Premier Edgar Faure resigned after national assembly rejected, 309 to 283, proposed 15% tax increase to meet French commitments for western Europe's defense.

MARCH

1 King Farouk I of Egypt named independent Ahmed Naguib Hilaly Pasha as premier upon resignation of Aly Maher Pasha.

U.N. truce negotiators charged that Communist forces had impressed many South Korean prisoners of war and then falsely labelled them volunteers.

2 Egyptian Premier Hilaly Pasha announced suspension of parliament for one month.

3 Puerto Rican people overwhelmingly ratified constitution giving them self-government under U.S. control.

U.S. supreme court upheld, 6 to 3, New York law barring members of subversive organizations from teaching in public schools.

Pres. Andrés Martínez Trueba of Uruguay became chairman of 9-man governing council under constitutional changes vesting executive powers in the council.

4 Secy. of State Acheson denounced as entirely false Communist charges that U.N. forces had engaged in germ warfare in Korea.

Ivar H. Peterson was nominated by President Truman to be a member of the National Labor Relations board.

U.S. house of representatives voted 236 to 162 to return to committee administration-supported universal military training bill.

U.S. justice dept. requested that 186 members of the du Pont family, including an 8-mo.-old baby, be made defendants in antitrust proceeding in federal court in Chicago, Ill.

Dominican Republic charged that 5 soviet submarines had invaded its territorial waters.

5 Conservative government of Prime Minister Churchill received vote of confidence of 313 to 55 on the British rearmament program.

Kwame Nkrumah was named the first prime minister of the Gold Coast, British West African colony.

Secy. of State Acheson formally notified the house of representatives that no commitments concerning U.S. troops had been made during recent conferences between President Truman and British Prime Minister Churchill.

6 Pres. Harry S. Truman in a special message to congress requested \$7,900,000,000 for foreign military and economic aid during fiscal year beginning July 1, 1952.

National Production authority relaxed building controls on housing, commercial, highway and school projects.

Soviet Finance Minister A. G. Zverev submitted record budget for year 1952, estimating revenue at 508,800,000,000 roubles and expenditure at 476,900,000,000 roubles, of which 23.9% was earmarked directly for defense.

7 President Truman directed government officials not to comply with a house committee request for record of all cases referred to justice dept. in last 6 years in which action was declined.

8 Peking radio reported that Chinese Communist Foreign Minister Chou En-lai had formally charged the U.S. with waging germ warfare in Korea.

Independent Antoine Pinay formed France's first postwar rightist cabinet.

Gen. James A. Van Fleet, U.S. 8th army commander, revealed that Communist forces in Korea had been built up to about 900,000 men.

9 Strike of engineers, firemen and conductors crippled railroad service in the midwest.

The pictures on this page are, left to right:

ISMAY.....	March 12

MARCH—Continued

10 Former Cuban Pres. Fulgencio Batista ousted Pres. Carlos Prío Socarrás in an almost bloodless coup d'état.

U.N. headquarters in Tokyo announced that the North Korean army had been entirely equipped or re-equipped with soviet matériel and that the chief sources of supply for the Chinese Communists were soviet-furnished.

Soviet Union requested in notes to the U.S., the U.K. and France that a peace treaty be negotiated as soon as possible with a united Germany.

U.S. supreme court upheld, 5 to 3, contempt sentences imposed upon 6 defense attorneys for their actions during trial of 11 U.S. Communist leaders.

Striking railroad engineers, firemen and conductors in middle west began returning to work in deference to federal court order.

British Chancellor of the Exchequer R. A. Butler presented to house of commons record peacetime budget for fiscal year beginning April 1, estimating expenditure at £4,240,000,000 (\$11,872,000,000) and revenue at £4,778,000,000 (\$13,378,400,000).

12 Gen. Lord Ismay, British commonwealth relations secy., was appointed secy.-gen. of the North Atlantic Treaty organization; the marquess of Salisbury succeeded him in the British cabinet.

Lt. Gen. Sir Willoughby Norrie was appointed governor general of New Zealand by Queen Elizabeth II.

U.S. air force revealed that Boeing Airplane Co. had been awarded a contract to build the second U.S. atomic aeroplane in collaboration with the United Aircraft Corp.

13 President Truman's plan to reorganize the bureau of internal revenue became effective when the senate endorsed it, 53 to 37, after bitter debate.

Philippines-Formosa area was separated from the command of General Ridgway and placed directly under the commander, United States Pacific naval forces.

U.S., British and French governments proposed to the U.S.S.R. a new draft treaty with Austria and attacked the U.S. S.R. as responsible for failure to give Austria full independence as promised in the 1943 Moscow declaration.

Ba U was elected first permanent president of the union of

Burma by the Burmese parliament.

14 U.S. Ambassador John E. Peurifoy warned the Greek people that continuing governmental instability would have a disastrous effect on the efficient use of U.S. aid.

Chairman Tom Connally of the senate foreign relations committee condemned proposal to give the U.K. \$600,000,000 and France \$400,000,000 in economic aid during the 1953 fiscal year.

15 U.S. and Brazil signed a mutual military assistance agreement at Rio de Janeiro.

16 Negotiations with respect to the Iranian oil problem being conducted in Tehran by the world bank were reported to have broken down.

17 International boxing clubs of New York and Illinois were charged with conspiring to monopolize the professional championship boxing business in a civil antitrust suit filed by the U.S. justice dept.

18 Criminal and most of the other provisions of the lobbying act of 1946 were held unconstitutional by a special 3-judge district court in Washington, D.C.

19 Canadian Finance Minister Douglas Abbott presented budget estimate for fiscal year beginning April 1, showing total expenditure at Can. \$4,335,796,800 of which defense costs and production accounted for \$2,001,725,000.

20 U.S. senate consented to ratification of peace treaty with Japan and also of 3 mutual defense pacts with Japan, Australia and New Zealand and the Philippines.

Appellate division of South African supreme court declared unconstitutional laws placing coloured voters in Cape colony on separate rolls.

Wage Stabilization board public and labour members recommended a \$17½ hourly wage increase payable in 3 instalments over 18 months, increases in fringe benefits and union shop as settlement of the nation-wide steel labour dispute.

Academy of Motion Picture Arts and Sciences announced awards for best acting in 1951 to Humphrey Bogart ("The African Queen") and Vivien Leigh ("A Streetcar Named Desire").

21 Polish embassy in Washington was ordered by the U.S. government to stop immediately the release of all publications except routine announcements.

22 All British troops were withdrawn from the Egypt-

tian areas of Ismailia, Suez Canal Zone.

23 Egyptian parliament was dissolved by royal decree pending the holding of new elections.

24 Defense Mobilization Director Charles E. Wilson repudiated as a serious threat to the mobilization program the Wage Stabilization board's recommendations for settlement of the steel dispute.

President Truman urged congress to enact legislation admitting 300,000 European refugees to the U.S. over a 3-year period.

3 Allied authorities in Germany rejected Soviet demands that anti-Soviet groups in west Berlin be disbanded.

Gen. James A. Van Fleet, 8th army commander, stated that U.N. forces remained in complete control of the central front in Korea.

University of Kentucky cancelled its 1952-53 basketball schedule as the result of N.C.A.A. recommendations that it be placed on probation for violating N.C.A.A. rules in 1947-50.

4 Gen. Dwight D. Eisenhower and Sen. Richard M. Nixon won 39 states and 442 electoral votes to win U.S. presidential election; Republicans also won control of both houses of congress by a narrow margin.

Fighter plane with Soviet markings was intercepted over Hok-

kaido Island, Japan, by two U.S. planes and escorted back to Soviet territory.

New session of British parliament was opened by Queen Elizabeth II who in outlining the program of the conservative government promised quick action on denationalization bills.

France notified NATO that it would achieve its goal of 12 equipped divisions in 1952 but could not accelerate rearmament in 1953.

5 President Truman invited General Eisenhower to the White House to review transition problems.

Soviet government denounced as illegal the U.S. naval defensive zone around the Korean peninsula.

U.S. government again requested the return of 186 lend-lease naval vessels by the U.S.-S.R. as a condition to further lend-lease settlement negotiations.

6 Nobel prizes were awarded to François Mauriac of France, literature; Edward M. Purcell and Felix Bloch of the U.S., physics; and Archer J. P. Martin and Richard L. M. Synge of the U.K., chemistry.

7 1952-53 edition of "Jane's Fighting Ships" published in London revealed that the U.S. navy was as large as all the other navies of the world put together.

French union forces in Indochina cut off one of the main Viet-Minh supply lines to China.

British Colonial Secy. Oliver Lyttleton reported to the house of commons that Mau Mau activities in Kenya were based on perverted nationalism and a sort of nostalgia for barbarism.

Yugoslav Communist party congress elected a new 109-member Central committee which chose a 13-member executive committee to replace the Politburo; both were headed by Marshal Tito.

8 14 Negroes were reported killed and 39 wounded by police quelling a riot in Kimberley, S. Af.

President Truman acknowledged Gov. Adlai E. Stevenson as the titular head of the Democratic party.

9 General Eisenhower named Sen. Henry C. Lodge, Jr., as his primary liaison agent with the outgoing administration on all except budgetary matters, in respect of which he named Joseph M. Dodge.

British war office announced plans for withdrawal of the British garrison from the island of Bermuda.

NOVEMBER—Continued

Philip Murray, president of the C.I.O., died suddenly of a heart attack in San Francisco.

Large numbers of French parachute troops were dropped at Phuduan in Viet-Minh territory, 75 mi. northwest of Hanoi.

Arab league issued the text of a note to western Germany protesting the German-Israeli reparations agreement.

10 U.N. Secy.-Gen. Trygve Lie announced his resignation to the U.N. general assembly in the interest of great-power agreement.

Soviet Foreign Minister Vishinsky advised the political and security committee of the U.N. general assembly that the U.S.S.R. would never drop its opposition to voluntary repatriation of Korean prisoners of war.

U.N. general assembly was informed by French Foreign Minister Robert Schuman that France would not admit any discussion concerning the issues of Tunisia and Morocco.

11 U.S. Supreme Court Justice Robert H. Jackson denied before a congressional investigating committee that the U.S. government had tried to influence the international military tribunal which tried the nazi leaders in 1945-46 to the advantage of the U.S.S.R.

General Van Fleet, 8th army commander, announced that 2 new South Korean divisions had been activated and would soon be ready for combat.

12 U.S. government agreed to lend to Japan a fleet of 18 frigates and 50 landing craft.

Kashmir constituent assembly voted to replace the hereditary monarchy with an elected head of state.

Indian Vice-Pres. Sarvapalli Radhakrishnan was elected president of the 7th conference of U.N.E.S.C.O. at its opening session in Paris.

13 Appellate division of the South African supreme court held invalid the act creating the high court of parliament as South Africa's highest tribunal.

Bobby Shantz, pitcher for the Philadelphia Athletics, was

named the most valuable player of the American league in 1952 by the Baseball Writers Assn. of America.

Ceylon announced an agreement to increase shipments of rubber and other commodities to Communist China.

14 Prime Minister Daniel F. Malan of South Africa stated that his government would accept the appellate court decision invalidating the high court of parliament act but would appeal the decision to the electorate.

U.S. government rejected a Pakistani suggestion for an immediate cease fire in Korea before any decision on the prisoner of war issue.

Texas and Tennessee football teams were named to play in the Cotton Bowl at Dallas, Tex., on Jan. 1, 1953.

15 British colonial office announced that the colonies of Jamaica, Trinidad, the Leeward Islands and the Windward Islands had agreed to form a federation.

Princeton won its 6th consecutive Big Three football championship, defeating Yale, 27 to 21.

16 U.S. Atomic Energy commission's announcement that experiments contributing to thermonuclear weapons research had been completed at Eniwetok proving grounds in the Pacific was believed to refer to a hydrogen bomb.

Field Marshal Alexander Papagos' Greek rally party won a sweeping victory in Greek parliamentary elections.

U.S. marine force planes destroyed a North Korean hydroelectric plant southwest of Tongchon on the Sea of Japan.

17 India presented a compromise plan for a truce in Korea to the political and security committee of the U.N. general assembly.

Peking radio announced the reorganization of the Chinese Communist administrative system in preparation for the introduction of a 5-year plan in 1953.

U.S. supreme court refused to review the convictions of Julius and Ethel Rosenberg, sentenced to death for betraying U.S. atomic secrets to the U.S.S.R.

18 President Truman and General Eisenhower conferred at the White House on international affairs and arrangements for changeover from the outgoing to the incoming administration.

West German bundestag adopted a resolution denouncing as illegal parliamentary elections scheduled for Nov. 30 in the Saar.

President Truman reported to congress that U.S. arms shipments to western Europe fell considerably behind schedule in the first 6 months of 1952.

Georgia Tech and Mississippi football teams were named to play in the Sugar Bowl at New Orleans, La., on Jan. 1, 1953.

19 Communist forces launched heavy attacks on the Korean western front but failed to penetrate U.N. lines.

Spain was admitted to membership in U.N.E.S.C.O. by a vote of 44 to 4.

General Eisenhower stated that he agreed with the principle of no forcible repatriation of Communist prisoners in Korea.

Price Stabilizer Tighe E. Woods announced plans for the immediate suspension of price control on clothing.

20 Boleslaw Bierut became first premier of Poland under the new soviet-type constitution.

General Eisenhower announced the appointment of John Foster Dulles as secy. of state, Charles Erwin Wilson as secy. of defense and Douglas McKay as secy. of the interior in his cabinet.

Outfielder Hank Sauer of the Chicago Cubs was named the most valuable player in the National league in 1952 by the Baseball Writers Assn. of America.

South Korean national assembly rejected President Rhee's nomination of Lee Kap Sung as premier.

21 General Eisenhower announced that George M. Humphrey would be his secy. of the treasury, Herbert Brownell, Jr., his attorney general and Harold E. Stassen his director of mutual security.

William Green, president of

the A.F. of L. since 1924, died in Coshocton, Ohio.

French forces announced a progressive evacuation of outpost defenses along the right flank of their front in the Black river area in Indochina.

22 Jaime Torres Bodet of Mexico, director general of U.N.E.S.C.O., resigned in protest against a projected budget cut.

Southern California defeated U.C.L.A., 14 to 12, winning the Pacific Coast football conference championship; Wisconsin tied Minnesota, 21 to 21, tying Purdue for the Big Ten championship; Duke defeated North Carolina, 34 to 0, winning the Southern conference championship.

23 Gen. Nur Aldin Mahmud, army chief of staff, took over the premiership of Iraq under martial law after rioting mobs set fire to a U.S. information service building.

24 Price Stabilizer Woods submitted his resignation in protest against what he called a weak controls law.

General Eisenhower announced his intention to appoint Gov. Sherman Adams of New Hampshire as assistant to the president and Ezra Taft Benson of Utah as secy. of agriculture.

U.S. dept. of justice parole board rejected the application of Alger Hiss for parole after completing one-third of his sentence for perjury.

Viscount Swinton was named commonwealth relations secy. in the British cabinet in succession to the marquess of Salisbury, who was named lord president of the council, succeeding Lord Woolton, who was named chancellor of the duchy of Lancaster.

Southern California and Wisconsin were named to play in the Rose Bowl and Alabama and Syracuse in the Orange Bowl on Jan. 1, 1953.

25 George Meany of New York was unanimously chosen president of the A.F. of L. by its executive council.

NOVEMBER—Continued

New key appointments announced by General Eisenhower included Arthur E. Summerfield of Michigan as postmaster general, Oveta Culp Hobby of Texas as federal security administrator, and Ivy Baker Priest of Utah as treasurer of the U.S.

British government revealed plans for a huge hydroelectric and aluminum project to exploit bauxite deposits in the Gold Coast colony in British West Africa, contemplating a total investment of £144,000,000.

Halfback Billy Vessels of Oklahoma was awarded the Heisman trophy as 1952's outstanding college football player.

26 General Eisenhower named Arthur H. Vandenberg, Jr., of Michigan to be his secretary and William P. Rogers to be deputy attorney general.

Resignation was made public of William O'Dwyer as U.S. ambassador to Mexico.

27 11 prominent Czech Communists, including Rudolf Slansky, former secretary-general of the Czech Communist party, and Vladimir Clementis, former foreign minister, were sentenced to death on charges of treason.

U.S. government announced its support of the Indian compromise plan on disposition of Korean prisoners of war.

Pennsylvania defeated Cornell, 14 to 7, to win the Eastern (Ivy) league championship; Texas defeated Texas A. & M., 32 to 12, winning the Southwest conference championship.

28 Communist airfields and communications installations near the Yalu river in northwest Korea were bombed by U.S. planes.

Walter J. Cummings, Jr., of Chicago was appointed U.S. solicitor general by President Truman.

29 General Eisenhower named Sen. Henry C. Lodge,

Jr., to head the U.S. mission to the U.N.

Pope Pius XII designated 24 new cardinals, including Archbishops James F. McIntyre of Los Angeles, Paul-Emile Leger of Montreal and Aloysius Stepinac of Yugoslavia.

Georgia Tech defeated Georgia 23 to 9, winning the Southeast conference football championship; Oklahoma defeated Oklahoma A. & M., 54 to 7, winning the Big Seven conference championship.

30 Appointment of Winthrop W. Aldrich to be U.S. ambassador to Great Britain was announced by General Eisenhower's headquarters.

French-supported autonomous government of the Saar won a substantial victory in elections for a new parliament.

DECEMBER

General Eisenhower's headquarters announced the designation of Martin P. Durkin, a Democratic union leader, as secy. of labour, Sinclair Weeks of Massachusetts as secy. of commerce and W. Walter Williams of Washington as under secy. of commerce.

Adolfo Ruiz Cortines was inaugurated as president of Mexico in ceremonies at Mexico City.

Frank Coe, secy. of the International Monetary fund, refused to tell a senate security subcommittee whether he ever had been or was engaged in espionage against the U.S.

Special U.S. house committee opened hearings on election campaign financing.

2 Federal grand jury in New York returned a presentment castigating the U.S. state dept. for clearing disloyal U.S. citizens for key jobs at the U.N.

Col. Marcos Pérez Jiménez, a member of the Venezuelan ruling junta, seized control of the country following early election returns showing the leftist opposition ahead in constituent assembly elections.

French forces in Indochina claimed the most important victory of the war after repulsing an assault by Viet-Minh troops on the fortress of Nasan, about 100 mi. west of Hanoi.

3 President Truman overrode the Wage Stabilization board and approved a full \$1.90 a day wage increase for soft coal miners.

U.N. general assembly approved, 54 to 5, the Indian compromise solution for a truce in Korea.

President Truman invoked the national emergency provisions of the Taft-Hartley act in a strike by the United Steelworkers at an American Locomotive Co. plant at Dunkirk, N.Y.

4 Wage Stabilization Board Chairman Archibald Cox resigned in protest against President Truman's action in the soft coal case.

Walter P. Reuther, president of the United Automobile Workers, defeated Allen S. Haywood in the voting for presidency of the C.I.O.

5 General Eisenhower was revealed to have departed by air from Seoul en route to Guam after a 3-day visit to the Korean front.

President Truman accepted the resignation of Walter J. Donnelly as U.S. high commissioner in Germany.

6 Industry members of the Wage Stabilization board resigned in protest against President Truman's action in overriding board's decision in the soft coal case.

Group of Swiss mountain climbers was reported to have come within 150 ft. of reaching the summit of Mt. Everest, Nepal, the highest mountain in the world.

7 Severe anti-French riots broke out in the French zone of Morocco.

8 Isaac Ben-Zvi was chosen president of Israel by the Knesset (parliament) in succession to Chaim Weizmann, deceased.

General Eisenhower arrived off Wake Island on the U.S.S. "Helena" where he was joined by John Foster Dulles and other cabinet designates for a series of high-level conferences.

9 U.N. fighter-bombers wrecked 4 Communist rail terminals near the Manchurian border in what was described as the largest carrier raid of the Korean war.

Chinese nationalist government announced a 4-year economic development program designed to make Formosa self-supporting.

10 Premier Naguib of Egypt announced cancellation of the Egyptian constitution and the passing of authority to a transitional government.

National Production authority eased curbs, effective Jan. 1, 1953, on apartment house and other types of construction.

Clarence Munn of Michigan State college was named coach of the year by the American Football Coaches Assn.

U.S. government demanded in notes to the U.S.S.R. and Hungary that a U.S. plane shot down by soviet fighters in Hungary in 1951 be returned or damages paid.

11 President Truman characterized General Eisenhower's trip to Korea as a piece of demagoguery.

British Foreign Secy. Eden in a note to the U.S. state dept. stated that his government could not concede the right of the U.S. to subpoena documents from the Anglo-Iranian Oil Co. for a grand jury oil cartel investigation.

12 167 Arabs were sentenced to prison by a Moroccan court in Casablanca for demonstrating against the French government.

13 South Korean troops recaptured Little Nori hill on the western front in Korea.

Japanese Premier Shigeru Yoshida told the diet that the U.S. was bound to defend Japan in case of attack.

14 General Eisenhower, upon his return to New York from his trip to Korea, voiced confidence that a satisfactory solution of the Korean war could be speeded.

Cleveland Browns were defeated, 37 to 34, by the New York Giants but won the American conference football championship.

15 Peking radio announced formal rejection by Communist China of the Indian compromise plan adopted by the U.N. for truce in Korea.

U.S. state dept. announced the

suspension of John Carter Vincent, U.S. minister at Tangier, after a loyalty review board reported that there was reasonable doubt as to his loyalty.

U.N. prisoner of war command reported that 84 Communist prisoners had been killed and 118 injured in a new outbreak of rioting at camp on Pongam Island off South Korean coast.

U.S. supreme court held unconstitutional an Oklahoma law requiring state employees to take a loyalty oath.

Wage control was placed under a special wage stabilization committee consisting of the 4 public members of the Wage Stabilization board headed by Chairman Charles C. Killingsworth.

16 Prof. Owen Lattimore of Johns Hopkins university was indicted by a federal grand jury in Washington, D.C., on 7 counts of perjury.

NATO council approved the designation of British Vice Adm. Earl Mountbatten as commander in chief of all Allied naval forces in the Mediterranean except the U.S. 6th fleet.

Michael DiSalle of Ohio was appointed economic stabilizer by President Truman in succession to Roger L. Putnam.

17 Gen. Dwight Eisenhower and Gen. Douglas MacArthur conferred on possible plans for ending the Korean war.

NATO council ruled that the war in Indochina was a common security interest of NATO.

Yugoslavia broke diplomatic relations with the Vatican because it had refused to settle the state-church conflict in Yugoslavia.

U.N. general assembly adopted a compromise resolution ex-

pressing the hope that France and Tunisia would expedite talks on the issue of Tunisian self-government.

18 Proposal for direct Arab-Israeli negotiations on the Palestine issue failed to secure the necessary two-thirds majority in the U.N. general assembly.

NATO council adjourned in Paris after reducing to \$229,600,000 a \$473,000,000 military request for work on bases and communications in 1953.

19 World bank announced a loan of \$31,500,000 to India for expansion of iron and steel production.

General Eisenhower designated Roger M. Kyes of Michigan as deputy secy. of defense, Robert T. Stevens of New Jersey as army secy., Robert B. Anderson of Texas as navy secy. and Harold E. Talbott of New York as air force secy.

U.N. general assembly approved a compromise resolution expressing the hope that France and Morocco would expedite talks looking toward developing free political institutions for French Morocco.

20 86 persons were killed when a U.S. air force C-124 plane crashed shortly after take-off at Moses Lake, Wash.

Bey of Tunis yielded to a French ultimatum and approved 2 decrees on administrative reforms.

21 Egyptian government decreed that persons convicted of corruption would be barred from political activity and public office.

U.S. house subcommittee charged that the U.S. armed services were wasting large amounts of money in their giant building program.

George Meany, president of the A.F. of L., stated that his

organization was willing to settle for less than outright repeal of the Taft-Hartley act.

U.N. general assembly approved a budget of \$48,327,700 for 1953.

Detroit Lions defeated the Los Angeles Rams, 31 to 21, to win the National conference professional football championship.

22 Premier Pinay of France resigned in the face of impending defeat on 3 votes of confidence.

U.N. general assembly recessed after rejecting a soviet resolution that would have condemned the U.S. for murder of Communist prisoners of war on Pongam Island, Korea.

23 Seizure was reported of 26 Italian fishing boats in the Adriatic sea by the Yugoslav coast guard.

U.S. government released 500,000,000 S (\$19,230,000) in Marshall plan counterpart funds to Austria to finance measures for checking unemployment.

24 U.S. justice dept. revealed that 271 members of the crew of the French liner "Liberté" had been barred from the U.S. under the provision of the McCarran-Walter act which became effective at midnight.

Soviet Premier Stalin stated in a letter received by a news correspondent that he was willing to start negotiations with the incoming U.S. administration with the objective of holding a meeting with General Eisenhower.

25 Civil Aeronautics board announced that scheduled air lines operated within the U.S. during 1952 with a passenger fatality rate of .38 per 100,000,000 passenger miles, the lowest on record.

26 U.N. forces turned back four Communist probing attacks along the Korean front.

27 U.S. army dept. requested the selective service system to induct 53,000 men in Feb. 1953, the highest number since early in the Korean war.

In annual Shrine football game at San Francisco, east defeated the west, 21 to 20.

28 General Eisenhower named an advisory committee headed by Dean William I. Myers of Cornell university to aid in shaping national farm policies.

200 U.N. planes attacked a Communist supply and barracks area near the North Korean capital of Pyongyang.

Detroit Lions defeated the Cleveland Browns, 17 to 7, to win the National (Professional) Football league championship.

29 East German government announced the dissolution of its propaganda office which was headed by Gerhart Eisler, Communist leader who escaped from the U.S.

Gen. Hoyt S. Vandenberg, U.S. air force chief of staff, reported that the U.S.S.R. had produced 5 times as many planes as the U.S. during the past 5 years.

National emergency injunction provisions of the Taft-Hartley act were held constitutional by a U.S. district court at Buffalo, N.Y.

30 Jockey Tony DeSpirito rode 4 winners at Tropical park, Fla., to break the world riding record with 389 winners in 1952.

Tuskegee institute reported that 1952 was the first year without a lynching since the year 1882, when records were first kept.

31 Soviet Union relinquished its rights in the administration of the Chinese Changchun railway in Manchuria.

Accident Insurance: *see* INSURANCE.

Accident Prevention. Accidents caused 94,000 deaths in the United States in 1951. This total was exceeded only by deaths from heart disease, cancer and cerebral haemorrhage. Information available through July 1952 indicated that the 1952 accidental death total for the year would be slightly higher than in 1951. There were 9,400,000 injuries in 1951.

The 40th National Safety congress held in Chicago, Ill., in Oct. 1952 marked 40 years of organized effort, spearheaded by the National Safety council and affiliated local safety councils throughout the nation, to reduce accidents.

Based on the rate of deaths per 100,000 population from 1900 to 1912, it was estimated that the organized attack on this social problem had resulted in saving 500,000 people from accidental death from 1913 to 1951.

Safety work was constantly carried on by industries and by a large number of organizations, both governmental and private, operating in various spheres of activity, such as industry, traffic, the school, the home, the farm, etc.

Serving as a place for group planning and education by all who take part in the safety movement, the National Safety council attempts to discover the facts of accident occurrence; devises or helps to devise engineering, educational and enforce-

ment measures for prevention; assists in determining engineering requirements for the safe design, construction and use of machines and equipment; helps formulate model safety legislation; participates in planning and executing training and educational programs; disseminates this information widely to interested groups and to the general public; and encourages and assists the establishment and functioning of community and state safety organizations.

Industrial Safety.—Building on forty years of experience in preventing work accidents, the country's progressive industries continued to pursue thoroughgoing safety measures in 1952, recognizing accident prevention as an important element in efficient operation.

Trade associations and other employer groups emphasized accident prevention programs in their meetings and publications. Labour organizations recognized accident-prevention efforts as an important element in serving their members. Government agencies, such as state and national labour departments, also carried on safety programs as important parts of their operations.

In June, Pres. Harry S. Truman called a Conference on Industrial Safety, which was held in Washington, D.C. At this conference, the president offered an eight-point program to the 1,250 delegates from 43 states and from all the territories. The focal point of the two and one-half days of deliberation and discussion was safety of the employee in the small plant.

During 1952 several teams of European and South American industrialists visited the United States to study industrial safety methods and progress. A number of specialists in various fields of safety in the United States were sent to several foreign

countries to assist those countries in setting up and establishing safety programs.

It appeared late in 1952 that the year's toll of occupational accident fatalities probably would be a little more than the 1951 toll of 16,000.

Traffic Safety.—During the first eight months of 1952, there were 23,770 motor-vehicle deaths, an increase of 3% over 1951.

Various professional, industrial, insurance and other groups continued in 1952 their programs of education, enforcement and engineering in the traffic safety field.

The first teen-age traffic conference ever held in the U.S. was held in Golden, Colo., in August. More than 1,200 delegates were present for the precedent-setting occasion, including parents, educators and public safety officials, with the young people accounting for 900 of the total number attending.

A meeting of the President's Highway Safety conference was held in Chicago, Ill., in October. This was a conference of committee reports rather than a full-scale session.

In the 1951 National Traffic Safety contest, which takes account of good safety records as well as sound programs in all phases of traffic safety, Colorado received the grand award among states and Shaker Heights, O., among cities.

Awards for outstanding performance in traffic law enforcement in 1951 were granted, among the states, to Delaware, West Virginia, Oklahoma, Colorado and California. City winners, in various population groups, were Los Angeles, San Francisco, Oakland, Pasadena and Sacramento, Calif.; Washington, D.C.; Toronto, Can.; Dallas, Tex.; Seattle and Richland, Wash.; Denver, Colo.; Oklahoma City, Okla.; Jackson, Lansing, Birmingham and Kalamazoo, Mich.; Columbia, S.C.; Oak Ridge, Tenn.; Shaker Heights, O.; Winnetka, Ill.; and Bristol, Va. This was the fourth year that police agencies had been honoured for excellence in traffic work, the awards being based on evaluation of enforcement reports of cities and states.

SCULPTURE for bronze statue to be awarded by the National Safety council in a program established in 1952 to honour women's contributions to highway safety

Awards for outstanding traffic engineering were given to Delaware, Virginia, Minnesota, Washington, California and Michigan among states and Detroit, Mich., Cleveland, O., Milwaukee, Wis., Buffalo, N.Y., Kansas City, Mo., Providence, R.I., Flint, Mich., Evanston, Ill., Miami Beach, Fla., and Rocky River, O., among cities.

Farm Safety.—Recognition of the seriousness of the farm accident problem was indicated by the fact that in 1952, 29 states had state farm safety committees and 12 states had full-time farm safety specialists, working through many public and private agencies to spread information on the seriousness of the farm accident problem and ways and means of meeting it.

The president of the United States, for the eighth successive year, proclaimed a National Farm Safety week in July 1952, which focused attention on the problem of rural accidents. More than 1,500,000 pieces of educational material were distributed, and radio, newspaper and magazine support was excellent.

School and Child Safety.—Among children and young people from 1 to 24 years of age, accidents rank first as a cause of death. For children under 5 years of age, the total accidental death rate in 1952 was about half of the rate at the turn of the century while the motor-vehicle rate was about 15% lower than the 1929 peak. For children 5 to 14 years old, also, the total accidental death rate was about half the 1903-07 average, while the motor-vehicle rate was about 40% less than the 1927 peak.

A specialized feature of school safety work was the driver training program instituted in many high schools throughout the nation. Studies showed that students who had this training were involved in fewer accidents than those who had not.

Home Safety.—The 1951 toll of deaths in home accidents was 28,000. Estimates for 1952, based on the first seven months, indicated that home fatalities in 1952 would number slightly more than in 1951.

Activity in home safety during 1952 consisted in large part of improved and expanded safety education of people generally, both through the general media of public information and through specific instructional material.

Local and state health departments gave increased attention to accident prevention work, concentrating on home safety. Women's clubs and other organizations and agencies attracting the support and interest of homemakers showed an increasing tendency to include safety in the home as a regular program activity.

Community and State Safety Organizations.—Community and state safety organizations serve in their respective areas to provide leadership in a co-operative effort among all groups and individuals working together for the conduct of safety activities. Control of accidents in any community involves the joint efforts of traffic enforcement and engineering authorities, public information channels of various kinds, industry, labour, service groups and many others. It is the function of the local safety council to harmonize and co-ordinate these activities.

During 1952, approximately 90 out of the several hundred local and state safety organizations throughout the country qualified for acceptance as chapters of the National Safety council, the relationship signifying that these organizations fully represented the National Safety council in the communities in which they operated, although at the same time they retained their autonomy.

(R. L. Fo.)

Canada.—In 1951, auto accidents took 949 lives in Ontario, compared with 791 in 1950, and injured an additional 22,557 persons. The authorities tried diligently to curb the toll. Manitoba reported that in two years traffic fatalities in that province had been cut by 50% and all traffic accidents by 18%. The method involved a record of all Manitoba drivers with points scored for all driving errors, accidents and convictions; each

point meant a warning letter for a driver, and when a driver reached eight points he had to enter a driving clinic or lose his licence. A probationary licence was issued to those who passed the clinic.

Industrial accidents in Canada were the highest ever in 1951 (1950 in parentheses): 488,361 claims (439,094) and 1,155 (1,011) deaths. A 1952 survey revealed that falls, cutting instruments and crushing accounted for 71% of total time lost through farm accidents; 27% was from kicks from animals and misadventures with engines and tractors.

(C. Cy.)

Great Britain.—Road Safety.—The ministry of transport continued its road safety campaign with the help of local authorities and of the Royal Society for the Prevention of Accidents. "More Courtesy" was chosen as the theme for 1952. A national safety week was held (Aug. 2-9), the theme being "Safe Driving." On Aug. 1 the minister of transport broadcast an appeal to all road users.

A team of representatives of the ministry, the Royal Society for the Prevention of Accidents and members of parliament toured the London-Brighton road to watch road behaviour. There was an exhibition of roadmanship at London's Charing Cross underground station.

The government's committee on road safety issued reports on the revision of the Highway code; on motorcycling accidents and on the 1951 Chatham bus disaster in which 23 cadets were killed. In February the minister of transport broadcast on zebra crossings to explain correct crossing procedure.

Arising out of a private member's motion in the house of commons in June, the parliamentary secretary to the ministry of transport reviewed measures to be taken by the government to increase road safety: viz., illumination of zebra crossings; elimination of "black spots"; financial aid for the provision of school patrols; and proposals for increasing the number of mobile police patrols. It was announced that £1,500,000 would be made available for the removal or improvement of "black spots."

The Duke of Edinburgh, presiding at the annual meeting of the Automobile association, appealed to all organizations interested in road safety to work together. As a result, the president of the Royal Society for the Prevention of Accidents called a conference of 37 national societies in October.

The National Safety congress was attended by more than 1,000 local authority delegates.

Nearly 300,000 commercial drivers entered the 35th National Safe Driving competition. The number of child cyclists who passed the Royal Society for the Prevention of Accidents' Cycling Proficiency test reached a total of more than 32,000 since the scheme started in 1947. A typical test at a Croydon school was televised by the British Broadcasting corporation.

Industrial Safety.—An Industrial Safety conference and exhibition held in Scarborough was attended by more than 600 representatives of industrial firms. Other conferences included a Chemical Works Safety conference; a one-day conference of industrial representatives in London on "The Management and Accident Prevention"; and the annual conference of the Industrial Safety Officers' section. H. R. Payne, chairman of the National Industrial Safety committee, gave the Shaw lecture at the Royal Society of Arts on "Industrial Accidents."

A "Better Housekeeping" week was held in industry throughout the country (Oct. 6-11).

Home Safety.—The 35th local Home Safety committee was formed. The Children & Young Persons (Amendment) act 1952 came into force on Oct. 1. This raised the age limit in connection with the necessary provision of fireguards from 7 to 12 years and extended the section to any heating appliance likely to cause injury. A classified précis of fatal accidents in the home, Jan.-Dec., 1951, was produced by the electrical branch of the

PROPERLY LIGHTED PEDESTRIAN-CROSSING in England. These zebra-striped crossings were introduced as a pedestrian safety measure, though in 1952 they caused an increase in crossing accidents where improperly lighted

home office. (See also DEATH STATISTICS; DISASTERS; INDUSTRIAL HEALTH.)

(H. I. S.)

Acheson, Dean Gooderham (1893-), U.S. secretary of state, was born on April 11 in Middletown, Conn., attended the Groton school and graduated from Yale in 1915 and from the Harvard law school in 1918. He served in the navy in World War I and was for two years private secretary to Louis Brandeis, associate justice of the U.S. supreme court. He practised law, served for six months as undersecretary of the treasury in 1933, and entered the state department in 1941, first as assistant secretary of state and later (Aug. 1945 to June 1947) as undersecretary. He was sworn in as secretary Jan. 21, 1949.

Acheson was a chief author of the Truman foreign policy, and strongly supported measures for international co-operation, such as the North Atlantic alliance and the United Nations military operations in Korea. Yet because he had been high in government counsels during the wartime and postwar periods when the Soviet Union and international communism gained greatly, he was the continual target of criticism from foreign policy critics within both political parties. Especially after the entry of red China into the Korean war, demands for his resignation grew apace, and Pres. Harry S. Truman repeatedly issued denials that Acheson would leave his post. The storm about him grew hottest after the ouster of Gen. Douglas MacArthur as commander of the U.N. forces in Korea, a move that precipitated the "great debate" on U.S. foreign policy.

In Feb. 1952 Acheson represented the U.S. at the North Atlantic Treaty organization conference in Lisbon, Port. At Bonn, Ger., on May 26 he signed the peace contract with the new

German Federal Republic. The following month he returned to western Europe, visiting London, Berlin and Vienna and flying from there to Brazil for a week's "good-will tour" (July 2-8).

Aden. British colony and protectorate and free port on the south coast of Arabia. (Also Kamaran [area 22 sq.mi.; pop. c. 2,200], a pilgrimage quarantine island and radio station off the Yemen coast, is administered from Aden.)

Colony.—Area: 80 sq.mi., including Perim Island (5 sq.mi.) and Kuria Muria Islands. Pop.: (1946 census) 80,876; (1951 est.) 100,000. Language: Arabic; Indian dialects and Somali are also spoken. Religion: Moslem.

Protectorate.—Western and eastern areas, the latter including the Hadhramaut and Socotra Island. Total area, 112,000 sq.mi. Pop.: (1951 est.) 650,000. Religion: Moslem. Premier chieftain (western), Fadl Abdul Karim, sultan of Lahej, until June 4, 1952, when succeeded by Ali Abdul Karim al-Abdali; premier chieftain (eastern), Sir Salih bin Ghalib al Qu'aiti, sultan of Shihr and Mukalla. Governor in 1952, Tom Hickinbotham.

History.—In April 1952 the sultan of Lahej ordered the killing of two of his amirs and fled to the Yemen. Protectorate levies were sent to Lahej for a few days to maintain order, and a temporary regency was established. The sultan was deposed by his people and his brother was elected to succeed him in June. Aden came into the news again shortly afterward when a Panamanian-registered tanker, the "Rose Mary" carrying oil from Iran was detained at the port by an order of the court, and litigation followed about the ownership of its cargo. Aden college was opened during the year to provide secondary, and later higher, education for boys from both the colony and the protectorate. At Abyan about 100,000 ac. were under irrigation.

(K. G. B.)

Education.—Schools (1951): public, primary 11 (teachers 112, pupils 2,360), secondary 3 (teachers 40, pupils 716); independent (aided and nonaided), primary 19 (teachers 59, pupils 2,677), secondary 8 (teachers 34, pupils 1,038).

Finance and Trade.—Monetary unit: East African shilling, valued at 14 cents U.S. (Sept. 1952). Budget (1952 est.): revenue £1,513,389; expenditure £1,476,962. Foreign trade (1951) imports: £50,216,737; exports £44,366,309. Principal export: salt (338,768 tons in 1951).

See W. H. Ingrams, *Arabia and the Isles* (London, 1952).

Adenauer, Konrad (1876–), German government official, was born at Cologne, Jan. 5. Following a university education at Freiburg-in-Breisgau, Munich and Bonn, and three years as a lawyer, he was in 1906 elected town councillor in his native city. Eleven years later he was elected *Oberbürgermeister* (lord mayor) of Cologne, an office which he held uninterruptedly for 16 years. From 1917 to 1933 he was a member of the Prussian *landtag* and in 1928-33 was its speaker. During World War II he was detained for a time in Brauweiler concentration camp. In Feb. 1946 he was elected chairman of the Christian Democratic union in North Rhine-Westphalia, and on Sept. 1, 1948, was elected president of the parliamentary council drafting the west German constitution. On Sept. 15, 1949, after the elections to the *bundestag* of the new west German republic had given the C.D.U. the largest number of seats, Adenauer was appointed chancellor.

Adenauer's chancellorship was marked by the substantial economic recovery of the republic and by renewed German participation in external politics. In 1951 and 1952 he had discussions with Dean Acheson, U.S. secretary of state, and with Robert Schuman and Anthony Eden, foreign ministers of France and Great Britain, and with his Italian and Benelux (Belgium, the Netherlands, Luxembourg) colleagues. At a meeting in London,

Feb. 17-19, 1952, with Acheson, Schuman and Eden, agreement on western German rearmament was reached, and on May 26, 1952, at Bonn, Adenauer signed the "convention on relations between the three powers and the Federal Republic of Germany." The next day in Paris he signed a treaty establishing the European Defense Community. On July 9, in a speech to the *bundestag* at Bonn he warned that western Germany's only alternative to the European Defense Community was Soviet domination. He was the first president of the European Coal and Steel Community Council of Ministers to be elected (Luxembourg, Sept. 8). (See also EUROPEAN UNION.)

Advertising. Advertising in the United States continued to expand in volume during 1952, standing in August approximately 9% above its level of 1951. Television persisted as the most spectacular advertising medium, the expenditures on network television being 52% higher during the first eight months of the year than for the comparable period a year before. If the midyear rate of growth for all advertising were continued, an expenditure for the year of more than \$7,000,000,000 would be indicated.

Television.—The networks were deriving a larger proportion of their revenues from television than from radio. The volume of advertising in network television was \$111,667,702 for the first eight months of 1952, compared with \$73,459,488 for the comparable period the year before. The volume of network radio advertising was \$103,982,740 for the 1952 period. The 19,124,900 television sets in use by October compared with only 10,000,000 at the beginning of 1951 and 3,950,000 in 1950.

It was believed that the growth of television would be accelerated by the action of the Federal Communications commission in lifting in April its ban of more than three years' duration on the construction of new television stations. The commission provided for the opening of 2,053 new stations in 1,291 communities in the United States and its possessions. Only 108 stations had been on the air, capable of reaching only half the country's population.

Most advertisers on network television were appropriating additional advertising funds for their use of television, rather than reducing their expenditures in other media. Only radio seemed to suffer materially. The 171 leading advertisers on television spent 87.3% more in that medium during the first six months of 1952 than in the first half of 1951. They spent 6.2% more in magazines, but 13.7% less in network radio.

Neither was the impact of television upon the audiences of other advertising media especially adverse. A survey by Daniel Starch and Staff showed that there was no significant difference in readership of newspapers in homes with or without television. Studies by other organizations showed that there was a decline in radio listening and motion-picture attendance in homes with television, but that readership of newspapers and magazines increased.

Radio.—Network radio advertising stood at \$103,982,740 for the first eight months of 1952, compared with \$119,044,020 for the same period in 1951. In spite of this decline, radio listening was healthy, the A. C. Nielsen company reporting more than 43,800,000 U.S. homes with radios, or 98% of all homes. A Pulse survey indicated that there were 27,500,000 radio-equipped automobiles. It was estimated there were 105,300,000 radio sets in use in the United States.

The Nielsen organization also reported that there was still

an average of 2.84 hours of radio tuning a day in all homes with radio, compared with 1.73 of television viewing. But considering only homes with television, the viewing was 4.33 hours a day, compared with 1.66 hours of radio tuning.

The National Association of Radio and Television Station Representatives reported that cost of spot radio per thousand sets in use and per thousand radio families was 26% and 11.9% lower, respectively, in 1951 than in 1941. Although radio station operating costs had risen, spot radio remained relatively low in cost because the audience had increased.

The National Broadcasting company presented to its affiliates a plan to revise the network's rate and discount structure. Among other effects, the revisions would reduce net time costs to evening advertisers by from 23% to 30%. More than 95% of Columbia Broadcasting system's affiliates had agreed to a new rate and discount structure that was incorporated in the system's rate card effective in August.

For the first time in history national spot sales in 1951 passed network time sales and it was estimated that they would make further advances in 1952.

Newspapers.—Estimates by Media Records placed the total of general and automotive advertising in newspapers at 6.4% lower during the first half of 1952 than for the comparable period in 1951. The shortage of materials brought about by the steel strike resulted in some falling off in advertising, especially in the industrial and housing equipment and supplies classifications. The lagging cigarette advertising of the first six months was stimulated in the summer by the introduction of another king-size cigarette. During the summer the tire manufacturers were more active in advertising than in recent years, using large newspaper space to feature economies in new tires and special trade-in deals.

In June the Bureau of Advertising, American Newspaper Publishers association, announced that national advertisers in 1951 spent \$513,486,000 for newspaper advertising, exceeding the 1950 total by \$14,467,000 or 2.9%.

A study released by the Bureau of Advertising in October showed that manufacturers of soaps and detergents spent \$55,919,533 for advertising in 1951, compared with \$37,543,029 in 1950, an increase of 50%. Their investment in television was \$13,369,782 in 1951 compared with only \$896,035 in 1950, but their investment in newspaper advertising also rose to \$21,753,202 from \$15,459,490, and in magazine advertising to \$5,182,348 from \$4,058,664. Only radio network suffered, the appropriation of \$17,128,840 in 1950 dropping to \$15,614,201 in 1951. Newspapers took 39% of total appropriations, television and radio combined took 51.8%.

It was announced that 579 daily papers had joined the Advertising council's newspaper co-operation plan, whereby each periodically contributed space for the advertising of public service messages originated by the council.

Magazines.—During 1952 magazines were busy increasing their advertising lineage, enlarging their circulations, boosting their advertising rates, changing their formats and adding to their editorial contents.

In the first eight months of 1952 advertising in general and farm magazines totalled \$344,678,162, compared with \$314,699,630 for the same period the year before. Substantial gains were recorded in the classifications of food and food products, automotive, building materials, office equipment and writing supplies. The Magazine Advertising bureau forecast a volume of advertising in U.S. magazines in 1952 of more than \$550,000,000.

The bureau also announced circulation of general and farm magazines at 158,841,553 at midyear; there were 99 copies per 100 population compared with only 20 copies per 100 in 1914.

SEARCHLIGHT used in a variation of sky-writing developed by a German firm in 1952. The giant slide-projector, with 5,000,000 candle power, was designed to throw advertisements on clouds or, on a clear night, on a smoke screen laid down by a plane

It stated that 82% of all families and 69% of all individuals were magazine readers.

In July totals on magazine sales in 1951 were published, showing that they stood at 3,720,000,000 copies, an increase of 7.5% over 1950. This was an average of more than 30 copies of magazines for every person in the United States ten years old and over. It meant that more than 10,000,000 magazines were bought every day of the year by subscription or on newsstands.

Many magazines were reaching all-time highs in circulation, and as the result of such achievements announcing increases in advertising rates, many of them in the neighbourhood of 10%. (See also NEWSPAPERS AND MAGAZINES.)

Other Media.—Dollar volume of direct mail advertising was estimated by the Direct Mail Advertising association to be \$856,936,423 for the first nine months of 1952, a gain of more than 10% over the corresponding period in 1951. The association's grand award for the best campaign of the year went to National Broadcasting company for its advertising in promotion of television.

In the first study of its kind, the Associated Business Publications revealed that 489 advertisers spent \$74,061,817 in business paper advertising in 1951. The association indicated it would publish the study annually. Many business publications announced in the course of the year increases in advertising rates, continuing a trend that was pronounced in 1951.

At the end of September the volume of outdoor advertising was running at a rate 9% above the previous year. Expenditures

in 1951 totalled \$89,600,000. It was estimated that the outdoor industry spent approximately \$40,000,000 a year on the construction and maintenance of about 275,000 poster panels and 35,000 painted bulletins.

According to a survey by the International Council of Industrial Editors, company publications had a combined monthly circulation of 70,718,860, and more than \$112,000,000 was spent annually on about 6,500 publications sent to employees, customers and stockholders.

Advertising Appropriations.—A study of 151 companies made by the Association of National Advertisers revealed that these firms planned to spend more for advertising in 1953 than in 1952. Advertising expenditures for 1952 were estimated at 10% higher than in 1951, and it was forecast that in 1953 appropriations would be 14% more than in 1951. These companies reported that in 1952 their advertising expenditures were on the average 2.55% of sales, compared with 2.25% in 1951. These percentages of sales ranged for individual industries from a high of 30% for drugs and cosmetics to approximately 1% for paper and petroleum and lower still for some other classifications.

The National Industrial Advertisers association also published a study of advertising budgets in 1952, based upon the experience of 515 companies. As to the method used in setting the appropriation, 71.1% said their method was based upon the task to be performed, and that it considered many factors; 36.4% based their appropriation upon a percentage of anticipated gross sales for the current year; 28.7% upon a percentage of gross sales for the past year. Some companies used more than one of these methods and some used methods other than these. Slightly less than half asserted they were able to determine the effectiveness of their advertising. Approximately a third said they prepared their budgets in October, 27% in November and 14% in September. Approximately two-thirds reported that their advertising agencies helped them set the advertising appropriation and three-quarters declared their agencies worked for them on a basis where agency compensation consisted of 15% commission on space and time billed.

Advertising in Other Countries.—In the United Kingdom the newsprint shortage continued to restrict advertising, although publishers were expecting relief. Newsprint per capita was 28 lb., compared with 75 lb. in the United States, whereas daily newspaper circulation was 630 per 1,000 population against

360 in the U.S., and Sunday circulation 610 and 340, respectively.

A study by the Canadian Association of Broadcasters showed 3,454,000 homes with radio as of Jan. 1952, an increase of 55.9% since 1946. Private commercial stations numbered 134 against 99 in 1946. The average cost of one-minute class A announcements was estimated at \$9.33 in 1952-53, compared with \$8.73 in 1951-52, and one-hour class A at \$72.58 against \$68.45 in the same periods.

Television was making slow progress outside the United States. Compared with 19,000,000 sets in use in the United States, there were 1,500,000 in England, 18,000 in France, a few thousand in Switzerland. In Britain the house of commons extended the charter of the British Broadcasting corporation ten years, but ended its monopoly by authorizing competing commercial television stations when the current shortage of transmitting equipment was overcome. It was expected that this would not be for three or four years. Britain's newspapers were generally opposed to commercially sponsored television and radio. In Brazil television existed in Rio de Janeiro and São Paulo, but the high cost of receiving sets limited its use. This was also the situation in Argentina, but television had not yet appeared in Chile or Peru.

In France newsprint was still a problem and newspapers were thin although read avidly. Billboard advertising was flourishing, and television was in the offing. In Italy good radio time was booked heavily for months in advance. Newspapers were carrying their normal amount of advertising and cinema advertising continued as a popular medium.

Aeronautics: see AVIATION, CIVIL; AVIATION, MILITARY.

Afghanistan. An independent kingdom in the centre of Asia, Afghanistan is bounded north by the U.S.S.R., west by Iran, south and southeast by Pakistan and east by China (Sinkiang). Area: c. 251,000 sq.mi. Pop. (1951 est.): 12,000,000. Races: Pakhtons (Pathans) or Pashtuns 60.5%, Tajiks 30.7%, others 8.8%. Language: Pashtu or Pakhtu and Persian. Religion: Moslem, mainly Sunni. Chief towns (pop. 1950 est.): Kabul (cap. 307,000); Kandahar (195,000);

DOLLAR EXPENDITURES for all media of U.S. advertising, 1935 through 1951, and 1951 expenditures for selected media (Source: *Printers' Ink*)

PASHTUNIS, tribesmen on the frontier between Pakistan and Afghanistan who wished to set up a separate state of Pashtunistan. They are shown posing for a U.S. cameraman in 1952

Herat (150,000); Mazar-i-Sharif (100,000). King: Mohammed Zahir Shah; prime minister: (from May 1946) Shah Mahmud, the king's uncle.

History.—A royal proclamation was issued in February calling upon the people to elect the eighth national assembly (171 seats) within three months. As no census of population was ever taken there were no electoral lists, and elections consisted in calling public meetings which voted for the official candidates by acclamation. In Kabul, where the election took place on April 20, there were two opposition candidates, but the government candidates were said to be elected by considerable majorities; however, out of about 50,000 entitled to vote only 7,000 actually voted.

In October King Zahir at the opening of the new national assembly reiterated the country's desire to maintain close and friendly relations with all nations. He deplored the fact, however, that relations with Pakistan had not improved. "We have," he said, "the most friendly feelings for Pakistan, but we cannot forget the cause of Pakhtunistan (Pashtunistan)." Shah Wali Khan, Afghan ambassador to Great Britain, said in a press interview (*The Hindu*, Jan. 6) that the area of Pakhtunistan included the states of Chitral, Dhir, Swat, Bajaur, Tirah, Waziristan and Baluchistan. "The right of 8,000,000 Pakhtuns to enjoy freedom cannot be ignored," he added.

A bill to nationalize oil was passed in January by the seventh national assembly and a U.N. technical assistance mission under Philip Beck (U.S.) was invited to Afghanistan. Shortly after its arrival the mission visited the Shibarghan area in the northwest, about 45 mi. from the soviet border, where rich oil deposits had been discovered.

On Aug. 21 *Izvestia* published a report that this mission was a tool of the U.S. imperialists, who were planning the construc-

tion of military roads and airfields near the soviet border. Later A. Y. Vishinsky, the soviet foreign minister, sent a strong note to Kabul protesting against the mission's presence in Afghanistan. The Kabul government refuted this note in September, explaining that, as Afghanistan's economic life depended on motor transport, all oil prospecting was in the country's vital interests. (R. Pk.)

Education.—Schools (1951): elementary 334, pupils 100,250 (including c. 5,000 girls); secondary, lower 25; secondary, higher 7; teachers' colleges 2; University of Kabul with six faculties.

Finance.—Budget: total revenue estimated at 188,000,000 afghanis. Note circulation (April 1950): 800,000,000 afghanis. Monetary unit: afghani. After the devaluation of Jan. 1952, the official exchange rate in Kabul was: Rs. 100 = 635.90 afghanis (old rate: 508.71), making the afghani worth 4.75 cents U.S.

Foreign Trade.—Principal imports: textiles, sugar, china, motor fuel and paraffin (4,500,000 gal. in 1949), cement (18,100 tons in 1949), machinery, tea, coffee, cocoa. Principal exports: karakul skins (\$26,000,000 in 1950), carpets, cotton, raw wool, fruit, spices.

Transport and Communications.—No railways. Roads (1949): 2,265 mi. Licensed motor vehicles (Dec. 1950): cars 975, commercial 3,735. Telephones (1949): 3,899. Radio receiving sets (1949): 4,800.

Agriculture.—Main crops (metric tons, 1948 est.): wheat, 1,700,000; barley; rice, paddy 333,000; millet; maize; cottonseed 9,000; grapes 20,000; cotton, ginned (1951) 10,000. Livestock (Sept. 1948): horses 500,000; asses 1,000,000; mules 200,000; cattle 2,500,000; sheep 14,000,000; goats 6,000,000; camels 350,000; chickens 40,000,000. Raw wool production, greasy (1950 est.) 7,000 tons.

Agricultural and Industrial Chemistry, Bureau of: see AGRICULTURAL RESEARCH ADMINISTRATION.

Agricultural Research Administration. The Agricultural Research administration, established in 1942 as part of the U.S. department of agriculture, consolidated six research bureaus

and the Office of Experiment Stations. The administrator supervises or co-ordinates all other research of the department except economic research. He also administers the Research and Marketing act, which provides for expanded agricultural research and services in which the United States department of agriculture, state experiment stations, extension services, departments of agriculture and other public and private agencies co-operate.

A new type of cotton bandage, developed by the bureau of agricultural and industrial chemistry, was being made commercially in 1952 for the armed forces and was expected to be available soon for civilian use. The outstanding feature of the new bandage was its ready adaptability to irregular contours of the body. This conformity was gained by means of a simple chemical treatment, which resulted in a high degree of crimp and kinkiness that gave elasticity in both directions.

A new method for disposing of dairy waste developed at the bureau's eastern regional research laboratory promised to reduce stream pollution and convert a former waste product into a useful one. The new process was rapid, inexpensive and eliminated 95% of the waste before it was discharged into a stream. Half the organic material of the waste was converted to bacteria and removed as a sludge, and most of the rest was oxidized to carbon dioxide and water. The sludge was found to be useful as a fertilizer and a promising source of vitamin B₁₂.

Poultry nutrition studies conducted by the bureau of animal industry revealed that chickens perform one of the steps in the building of living tissue which formerly was believed to be possible only for green plants and micro-organisms. When very dilute sulphuric acid containing radioactive sulphur was injected into hens, radioactive sulphur was found in the proteins of their eggs. The proteins were then broken down to the amino acids. The methionine was found to be entirely free of radioactivity; the cystine was highly radioactive. Evidently the hens were able to use inorganic sulphate to make cystine but not methionine.

Research in co-operation with several state experiment stations identified chlorinated naphthalene compounds as one of the causes of X-disease (hyperkeratosis) in cattle. These compounds are found in various products used on the farm.

Further proof of the high-production inheritance that had developed in the bureau of dairy industry's Holstein herd at the research centre at Beltsville, Md., by the continuous use of good, proved sires, was indicated by the ninth cow to produce more than 1,000 lb. of butterfat. Her excellent producing ability was further indicated by her five lactation records to date, which totalled 111,645 lb. of milk and 4,583 lb. of butterfat.

After a long series of experiments with a large number of detergent compounds, a simple new test was developed for determining the fat content of milk and cream. The new test, which involved the use of a detergent compound instead of sulphuric acid, measured the fat content directly, rapidly and as accurately as the well-known Babcock test. Besides producing a clearer fat column in the bottle neck and permitting a more precise reading of the fat percentage, the detergent compound made the bottles easier to clean than when sulphuric acid was used. The use of the detergent also eliminated the danger to the operator from the corrosive action of sulphuric acid.

Tests in several locations by the bureau of entomology and plant quarantine revealed that the rate of application of DDT insecticide to the soil had little influence on the percentage of toxic residue. Soil samples were treated at the rates of 25 lb. and 50 lb. of DDT per acre, but the percentage of carry-over in eight years of testing was about the same in either case. DDT began to lose its killing power only in the fifth year after application, in tests with Japanese beetle grubs. A single treat-

ment at the 25 lb.-per-acre rate resulted in 98% grub kills within about four weeks after the grubs were put in the soil, during the first four years. It required slightly more than five weeks to get the same kill the fifth year.

A revolutionary method involving radiant energy had been developed in the laboratory and was undergoing field tests in an effort to eradicate the screwworm fly, which causes annual losses of millions of dollars in the eastern area of the United States. The new method involved the carefully timed liberation of laboratory-reared flies after exposing them to radiation that sterilized them. Because of the relatively small number of flies that survive the winter in Florida, it was believed that it could be proved practical to rear and liberate the infertile treated flies in numbers five to ten times as great as the wild flies in the area. The following generation in the field would then be much reduced below the number surviving the winter. By continuing mass liberations of treated flies over two winters and the intervening summer, it was hoped that the complete elimination of the fly could be attained in the southeast.

Experiments were conducted by the bureau of human nutrition and home economics to determine whether dietary deficiencies work greater hardship on one sex than the other. Growing and adult rats were used as the laboratory animals. When protein was low in quantity or of poor quality in diets otherwise good, young female rats were less seriously retarded in growth than the males. Likewise among adult animals, gross protein deficiencies caused less pronounced malnutrition with a lower death rate among females than among males. On the other hand, when young rats had diets adequate in all respects, the males gained weight more rapidly than the females.

In recognition of older people's food problems, the bureau prepared and issued a *Food Guide for Older Folks*. The guide gave information on using a food plan for good nutrition, supplemented by up-to-date information on nutrition and weight control, and suggestions for meeting special problems that older people frequently face, such as cooking for one or two; cooking with little equipment; and having a good diet when food must be easy to chew.

The bureau prepared a 24-page illustrated bulletin to help with the fitting problems of women who make their own tailored garments or undertake some alterations on ready-mades. The publication contained a key to the usual cause of common fitting problems and suggested ways to correct them.

During the year the bureau of plant industry, soils and agricultural engineering received 5,600 introductions of seeds and plants from abroad. This breeding material was being screened by the bureau in co-operation with state experiment stations in efforts to find characteristics that could be incorporated in crop plants in the United States to improve insect and disease resistance, yields and quality. In turn, the bureau sent 8,000 shipments of agricultural and wild plant materials to 76 countries for trial, together with advice on how the materials might best be utilized.

In plant disease studies it was found that antibiotics, which had proved so valuable for men and animals, also looked promising for controlling plant diseases. Bureau scientists applied minute amounts of 12 antibiotics as a thin layer of paste to the stems of black valentine bean seedlings and then inoculated the plants with halo blight, a bacterial disease. Streptomycin sulphate protected the plants 100%. Two other antibiotics did fairly well. Plants treated with the nine other antibiotics and the control plants developed the disease. Apparently the drug was absorbed by the stems and moved up to the leaves in sufficient amounts to prevent growth of the disease organisms. These experiments demonstrated a possible new means of con-

trolling bacterial disease in plants. Practical methods of applying these fundamental findings to crops in the field had not yet been worked out.

Studies on handling and transportation of fruits and vegetables produced improved methods for prepackaging and emphasized the importance of refrigeration in keeping packaged commodities fresh. They showed, for example, that apricots in sealed film would maintain satisfactory quality up to six days when stored at 40° F. but would develop bad odours and off-flavours quickly if held at 65° F. Carrots packaged in some types of film could be held for six days at 70° F., two weeks at 40° and three weeks at 32°. Onions, sweet corn and broccoli spoiled quickly when packaged in film that was not ventilated with small holes. Nutmeats, on the other hand, needed strong film that was moistureproof, airtight and not affected by the nutmeat oil.

The Office of Experiment Stations, as in former years, was responsible for the administration of federal-grant research funds appropriated to state agricultural experiment stations. The office reviewed and approved 599 new and revised research proposals and reviewed activities under 4,445 specific lines of research under way during the year. The administration of the federal experiment station at Mayagüez, P.R., remained a further responsibility.

(B. T. S.)

Agriculture. U.S. agriculture in 1952, though perhaps somewhat overshadowed by the record performance of Canada, produced more than its usual fabulous harvest, in spite of more than the usual critical weather situations. Planting and harvest seasons were generally early, and in many

areas warmer and drier than usual. Timely rains came, and the total volume of crop production was the second largest on record, about 3% less than the peak in 1948. Most crops were above average; of the major crops only winter wheat and rice set new high records, but corn and soybeans were the second largest on record. Livestock, too, was abundant, particularly beef cattle, which increased another 5,000,000 head during the year. More beef came to market. Prices were mixed, dropping away from ceilings in most cases, but still favourable at an index of 288 (1910-14=100) in September, compared with 291 a year earlier. Ceiling prices were suspended for most farm products. Gross farm income was a new record, but farm expenses increased at a more rapid rate than income, leaving net income substantially reduced compared with the record \$17,000,000,000 of 1947. Farm land values moved to new highs, but at a slower rate. Farm debt increased but was still low in relation to assets. The farm legislation of the year was mostly an extending and firming of earlier provisions.

Looking forward to 1953, the situation appeared mostly favourable with firm domestic demand likely, prices probably resistant to decline and supplies sufficient to dampen or stop the inflation spiral. The three major hazards, other than war, appeared to be the mounting costs of production, the rather alarming prospect that less favourable weather might be at hand, and the probability that the export market would decline, not only because of competitive foreign production but because of continuing dollar problems.

FLAME-THROWER TEAM burning the sharp spines off prickly-pear cactus plants on the King ranch, Tex., in the spring of 1952. A prolonged drought had dried up most of the grass on the range, leaving cactus the only natural food in abundance

*Estimates by the U.S. department of agriculture; 1952 figures are preliminary.

World agriculture harvested a record bread grain crop and achieved a record number of cattle. Canada harvested much of two enormous wheat crops in one year—a large portion of the 1951 crop, which overwintered in the field, and a fabulous 1952 crop. Cuba harvested a record sugar crop. Other highlights were the emerging land reform programs in Egypt and Iran, famine in China and India, Australia's drought and the unheard of importation of wheat by Argentina. Doubt arose as to whether rice trade in the far east would ever recover its pre-World War II level. Western European agriculture showed continued improvement and the true situation in regard to agriculture in eastern Europe and the U.S.S.R. became even less clear than a year before. Some agricultural raw materials, such as wool, lard and some other fats and oils, hides and jute, paced the price decline from highs reached after the start of the war in Korea, yet the cost of living in many parts of the world advanced to new levels. The United Kingdom removed restrictions on tea trade and consumption and reduced subsidies on most foods.

Crop Production.—Crop production in 1952 well illustrated the diversity and resiliency of U.S. agriculture. The early summer of 1952 was one of the hottest and driest on record, many eastern and southern parts of the country had temperatures

above normal, and rainfall was below normal east of the Rocky mountains. Serious drought occurred in a dozen states, ranging from Maine to Texas. The situation was especially devastating in an Alabama-Tennessee area, with temperatures up to 110° F. and little rain. Yet the southern Great Plains produced a record wheat crop and, more surprising, the southern and western cotton lands gave a crop more than 2,500,000 bales above average for the decade. The four so-called food grains, wheat, rye, rice and buckwheat, totalled about 42,000,000 tons, almost as much as the 1947 record.

1952	3,256,550	1,265,660	1,298,921	14,413	92,775	106,067	2,234,535	345,561

Though official feed grain acreage goals were not reached, the four feed grains, corn, barley, oats and grain sorghums, produced about 119,000,000 tons, to which corn made a large contribution in quality and quantity (3,256,550,000 bu.). An above-average hay crop appeared sufficient to provide a mid-western surplus for a deficit south. The four oil seeds, soybeans, cottonseed, flaxseed and peanuts, as a group were about one-third above average and 2% more than the 1951 record. Tobacco was a near record crop. Potatoes, white and sweet, were below average crops, as were the pulses (dry beans and peas). Fruit crops, excepting pears, were below 1951, most of them below average. Commercial vegetables for the fresh market were 3% below 1951 but 5% above average. Vegetables for processing were one-sixth below 1951 but 14% above average.

Table III.—U.S. Production and Yield Per Acre

	1952*		1951

ACRES OF CROPLAND per person in India, Europe, U.S.S.R. and the U.S.

Livestock Production.—Livestock and poultry on U.S. farms, revised in the light of the 1950 census of agriculture, in Jan. 1952 showed a net increase of about 4% over a year earlier. Further increase was indicated for most kinds during 1952. Livestock was up 4%, poultry 3%, meat animals 5%; milk

THE BELTSVILLE NO. 1, a new breed of meat hog developed by the U.S. department of agriculture, crossed from Landrace and Poland China blood. Dressed weight is about 80% of live weight on the average, but with a higher proportion of lean to fat than for the average market hog

stock declined slightly; work stock declined 11%. The total value for seven species was \$19,549,896,000, compared with \$17,127,355,000 a year earlier, cattle accounting for \$15,733,051,000 of the total. Milk cows reached a record average price of \$250 per head. As predicted late in 1951, the pig crops of 1952 were cut about 9% to about 93,107,000 head compared with the previous year, largely because of the unfavourable price-feed ratio (the corn-hog ratio). Cattle, however, increased to approximately 93,000,000 head.

Slaughter in 1952 of about 27,500,000 cattle and calves and 85,000,000 head of hogs plus sheep, lambs and poultry provided about 22,600,000,000 lb. of red meat and 5,750,000,000 lb. of poultry for consumption. Of that amount, more than 94% was distributed to U.S. civilians, about 5% to the U.S. military, and small amounts exported. Thus the U.S. civilian in 1952 consumed about 142 lb. of red meat and 35 lb. of poultry, 2% to 3% more than in 1951. Larger amounts, particularly of beef, were in the production line for slaughter in 1953. Cattle being fattened in the corn belt were at record numbers. Egg production was a new record, providing 406 or more per person. Milk production declined, as a decrease in numbers more than counterbalanced the high rate of production per cow.

Feed grains totalling 119,000,000 tons, plus 20,000,000 tons of carry-over stocks and additional amounts of oil meals, provided about 165,300,000 tons of concentrate feeds for the 1952-53 feeding year, compared with 169,800,000 tons a year earlier, but because of the reduction in livestock to be fed, mostly a reduction in hog numbers, the amount of .97 ton per animal unit was the same as in the previous year. The hay supply was above average, though regionally short because of drought.

It appeared that 1953 would provide more beef for slaughter, at somewhat easier prices. At least two questions were unanswered—whether the pig crop of 1953 would increase following the favourable 1952 corn crop, and whether the drought or semidrought conditions afflicting the western half of the country (and some other areas) would be eased before reduction in livestock herds, especially cattle, was inescapable.

Agricultural Stocks and Foreign Trade.—Trade in agricultural products in 1951-52 contributed more than 25% of all U.S. exports and more than 40% of U.S. imports. U.S. agricultural exports reached an unprecedented value of \$4,042,601,000, about 20% more than in the previous year and 5% more than the previous peak of \$3,850,000,000 attained at the end of World War I. The volume of out-moving agricultural

products in 1951-52 was 6% less than in 1919-20, though 18% larger than in 1950-51. Cotton (\$1,204,200,000) and wheat (\$1,066,800,000) contributed more than half the value. Compared with the values of the previous year, vegetables (+52%), wheat (+42%) and cotton (+28%) showed the biggest increases, whereas oil seeds declined by 29%. On a volume basis, milled rice increased 77% and lard 48%, but soybeans decreased 41%.

Agricultural imports into the U.S. in 1951-52 totalled \$4,692,665,000, compared with \$5,146,465,000 in the previous year. Of the 1951-52 total, \$2,727,848,000 was classed as complementary; i.e., goods of kinds for the most part not grown commercially in the U.S. Coffee was the major contributor (\$1,337,900,000), followed by crude rubber (\$787,800,000). Carpet wool decreased by 61%. Supplementary agricultural imports—foreign products similar to products of domestic commercial production—were valued at \$1,946,817,000, compared with \$2,280,853,000 in 1950-51. The leading item, cane sugar, increased slightly, but the second product, apparel wool, declined 28%. Molasses showed the major increase (+55%), cattle the major decline (−62%).

Meanwhile, carry-over stocks prior to 1952 crops were for many items reduced in the U.S., compared with a year earlier. Wheat declined to 253,895,000 bu. from 396,254,000 bu. in 1951; corn was less than 500,000,000 bu., compared with 739,000,000 bu. in the previous year; but cotton increased to 2,745,000 bales from a very low level of 2,278,000 bales a year earlier. Holdings of the Commodity Credit corporation of such items as dried eggs, dried skim milk, cheese and butter were sharply reduced. Meanwhile, reserve stocks were increased in some importing countries, especially western Europe and India. Canada also had substantially larger stocks available for export. In the U.S. it appeared that stocks at the end of 1952-53 would be somewhat increased, especially wheat.

Table IV.—Farmers' Average Prices, Certain U.S. Crops, on Selected Dates
(In cents per unit)

	Wheat per bu.	Corn per bu.	Oats per bu.	Barley per bu.	Rye per bu.	Buck- wheat per bu.	Pota- toes per bu.	Eggs per doz.	Cot- ton per lb.

Farm Product Prices.—Prices on all farm products changed very little in 1952, in spite of much fluctuation of individual commodities with season and marketing. The index stood at 288 (1910-14=100) in September, compared with 291 a year earlier. However, crops, perhaps largely as a result of support prices, were up to an index of 264 compared with 239 a year earlier. Livestock and their products, however, were down to 309 from 337 a year earlier. Though the over-all wholesale price level was only about 5% below the peak reached after the start of war in Korea, steers were fully 15% lower, hogs about 25%, cottonseed oil more than 40%, lard more than 55% and burlap about 60%. For livestock, cattle prices declined over-all nearly \$6 per hundredweight, but much of the decline was in lower grades of fat cattle, and in feeders and stockers which averaged \$23.40 per hundredweight in Sept. 1952, compared with \$32.40 a year earlier. Hog prices fluctuated erratically above

and below \$20 per hundredweight, little changed from 1951. Sheep and lambs declined \$4 to \$6 per hundredweight, and turkeys eased moderately.

The government's new retail price index eased slightly in September after a steady rise after February, a result of a 1% decline in food costs between mid-August and mid-September. Further declines were anticipated later in the year.

Farm Income.—Gross farm income for 1952 was estimated at \$37,600,000,000, 2% more than in 1951; of that total, \$33,500,000,000 were cash receipts from a record volume of farm marketings. Livestock and livestock products accounted for \$18,900,000,000, 3% less than in 1951, lower prices more than offsetting a larger volume. Crops at \$14,600,000,000 were up about 12% compared with the previous year, mostly because of an estimated 9% increase in volume of sales. Costs of farm production had risen almost constantly since World War II began, and 1952 was no exception—estimated costs of \$23,400,000,000 were 4% higher than in 1951. Interest payments showed the largest increase, reflecting the increasing indebtedness structure. Net farm income, estimated at \$14,200,000,000, was slightly below 1951 and in purchasing power was lower than any of the previous ten years, excepting only 1950.

A comparative balance sheet for U.S. agriculture as of Jan. 1952 showed assets of \$168,964,000,000, 9% higher than in 1951 and up 214% since 1940. However, omitting price increases, which might be easily lost, the value of physical assets increased only 2% or 3% in the year. Real estate made up the overwhelming bulk (\$94,586,000,000, up 9% in the year) of the total assets. Livestock (\$19,600,000,000) was somewhat more valuable than the farm machinery, etc. (\$15,308,000,000). Deposits and currency increased to \$15,200,000,000. Total liabilities increased about 10% to \$14,149,000,000, with short-term non-real-estate debt up by 21% to \$4,071,000,000.

In general, it appeared that the gross income in 1953 would not be larger, production expenses would be higher, and the realized net income would decline by about 5%.

Farm Values.—The census bureau in April reported that in 1950 there were 5,400,000 farms, with a total acreage of 1,159,000,000, and an average of 215.3 ac. per farm. The total value of land and buildings was more than \$75,000,000,000; the average farm was valued at \$13,941. One farm in each 51 earned more than \$25,000 in 1949—only about 2,000,000 farms earned more than \$2,500 in that year.

Meanwhile, farm land values continued to rise, but at a reduced rate. As of July 1, the U.S. farm land value index was 213 (1912-14=100), 5% higher than a year earlier; but for the four preceding months values rose only 1%, only 20% as much as during the same period a year earlier. Sales volume was one-third below the post-World War II peak.

Farm Labour.—Near the peak of the 1952 autumn harvest period, 13,252,000 persons were working on farms, of which 9,543,000 were farm operators or unpaid members of their families, and 3,709,000 were hired workers. This was nearly 100,000 more hired workers, but about 200,000 fewer family workers than a year before.

The average for all farm wage rates was about 69 cents per hour, 5% more than a year earlier. Monthly rates to married men, with house furnished, averaged \$146, compared with \$138 per month a year earlier. The agreement permitting Mexican farm workers to help harvest crops in the U.S., due to have expired on June 30, was extended for 18 mo.

Farm Machinery and Fertilizer.—Largely because of more and better machinery and fertilizer, it was estimated by the U.S. department of agriculture that agricultural production could be increased by 18% by 1955. Machinery of most types was in relative abundance late in 1952, partly because of farmer

resistance to high prices, though production was the lowest of all years since 1948. The number of tractors was estimated at about 4,170,000 of all kinds (89% of wheeled types), compared with 1,500,000 in 1940. Farmers were estimated to have spent in 1951 about \$3,000,000,000 for new equipment and machinery. Prices were up about 13% since June 1950.

The Rural Electrification administration indicated that nearly 90% of U.S. farms were receiving central station electric service, 211,229 having been added in 1951-52. (See RURAL ELECTRIFICATION.)

Fertilizer prices averaged about 3% higher than in 1951. Supplies of nitrogen available for 1952-53 were estimated at 1,585,000 tons, of which 62% would be solid nitrogen materials. In regard to phosphate fertilizers, sulphur and sulphuric acid bottlenecks were apparently mostly overcome in 1952, and the supply of available phosphoric oxide for the 1952-53 season was estimated as 10% above the 2,235,000 tons entering domestic trade channels in 1951-52. The 1952-53 supply of potash was estimated at 1,850,000 tons, about 17% more than in 1951-52. (See also FERTILIZERS.)

Commodity Credit Corporation.—The price level was such during much of fiscal year 1951-52 that the Commodity Credit corporation was not called upon to assume larger obligations in support of designated crops and livestock products. Instead it was able to make net reduction in some parts of its inventory. Loans or purchase agreements were made on 271,000,000 bu. of grain in 1951-52, compared with 319,000,000 bu. in the previous year. Wheat amounted to 212,000,000 bu. of the total, compared with 196,000,000 bu. the year before. The net realized

*Investment pledged and in inventory as of June 30, 1952.

†Book value total investment as of June 30, 1951, including loans approved.

loss for the year was less than one-sixth as large as the \$345,599,000 of 1950-51. Investment in supported commodities in June 1952 totalled \$1,437,346,000, compared with \$1,766,784,000 a year earlier. Investigations were carried out during the year of reported scandals, involving perhaps \$10,000,000 of the total inventory. Late in 1952 it appeared that the CCC holding of wheat in June 1953 might be a record, valued at about \$1,000,000,000.

Loans or purchase agreements had been negotiated with the CCC on 262,000,000 bu. by Sept. 15, compared with 121,000,000 bu. through Sept. 1951.

Legislation.—In the legislative field, considerable attention was given to grain storage scandals and reconsideration of the politics of grain storage and the presidential campaign of 1948. Farm legislation, existing or prospective, did not become a major matter of difference in the 1952 campaign, both candidates essentially endorsing existing price support laws.

Though bills calling for farm price supports as high as 100% of parity were introduced and the secretary of agriculture urged congress to end the sliding scale of price supports, while others saw little need for continuing supports during favourable economic periods, the end result was a measure, signed by the president, which included three major provisions: one delayed until Dec. 31, 1954, any shift to the so-called

GROSS FARM INCOME: net income and production expenses of U.S. farm operators, 1920-52, including government payments beginning in 1933. Compiled by the U.S. bureau of agricultural economics. Data on 1952 are tentative estimates

"modernized" parity formula for the six basic crops which was established in the Agricultural act of 1949; another delayed through 1954 the sliding scale of supports; and a third provided supports for long-staple cotton on a basis comparable with that given upland types.

Land Reform.—Land reform, meaning rather different things in different places at different times, received much more than academic attention in 1952. Besides committee attention, there were some major action programs.

After King Farouk had been swept from his Egyptian throne on July 26, 1952, agrarian reform became the order of the day. A plan, sometimes referred to as General Naguib's plan, and drafted by a group of army officers holding power, was endorsed by Premier Aly Maher and presented to the parliament. In essence the plan called for reducing the holdings of single individuals or companies to a maximum of 200 ac. each. The excess expropriated lands would be paid for, but in 30-yr. government bonds and at prices related to the land's low pre-World War II value, at ten times the rental value. The bonds would be non-negotiable and bear 3% interest. Such lands would be distributed to peasants, whether labourers or operators, holding less than five acres, and they in turn would pay the government for the lands over a 30-yr. period at the purchase price paid to the landlord, plus 15% to meet the costs of acquisition and distribution. Meanwhile, the peasants would be assisted by low-interest loans and newly organized farmer co-operatives. Distribution of a total of 700,000 ac. in two- to five-acre plots to about 140,000 peasants would touch directly only one-tenth of the estimated 1,500,000 landless. Orchards would be an exception as to size and would be up to 20 ac. in plot size—only graduates of technical or agricultural institutes would be eligible for the orchards. The act went beyond fundamental land redistribution—it required a 50-50 division of net profits between landlord and tenant. There was provision for regulating the wages of farm labourers—a provision which appeared to some likely to raise farm wages about 25% in the first year.

All owners of five acres or less were required to become members of co-operative associations which would buy, sell and collect land payments among other things—these co-operatives would operate under state-appointed managers and would require establishing about 4,000 co-operatives and training most of the required managers.

Meanwhile, in 1951 in Iran the shah began disposing of his holdings, and by Aug. 1952 about 19,500 ac. had been divided

among more than 800 peasants, the farms ranging from 14.5 ac. to 21 ac. each. Land distribution began on an experimental basis with the lands of 12 villages of the 17,000-ac. Veramin estate, imperial lands not far from Tehran. Scheduled to be distributed over the next 20 years were lands in 2,160 villages on the imperial estates—villages which in general were larger in terms of land and population than is average for Iran.

As planned, payment by the peasants for the land would be made over a 25-yr. period at 20% of its value, payments to go to a co-operative bank which would, in addition to lending functions, be charged with developing village facilities as well as with those of production and marketing. A period of at least five years of guidance under trained supervisors would be provided the new independent peasant landowners.

Premier Mohammed Mossadegh, who had requested and been given a broad grant of power for a six-month period (Aug. 1952 to Feb. 1953), decreed that the peasants must receive an extra 10% of the crops and profits and that landowners must, in addition, deposit another 10% of the income to aid needy farmers. The administration of this edict moved forward rapidly with an order on Aug. 18 from Premier Mossadegh to district and local officials giving them only 15 days (under penalty of discharge) to form village councils and to proceed to force landlords to return the specified 20% of their share of the harvest, that share to be divided equally between the peasants and the councils.

Drought and Famine.—In spite of a comparatively favourable over-all world food situation in 1952, drought and hunger, even stark famine, were more prevalent than since the immediate post-World War II years. Record high temperatures and drought did damage estimated at many millions of dollars in the south of the U.S. The King ranch in Texas experienced the worst drought in its 99-yr. history.

In Asia several areas reported famine. Hunan province, an important rice-growing area of China, Szechwan province in the interior, Kansu and Shensi in the northwest, Shantung and even Tibet (as a result of food seizures by the Chinese army), reported famine, major or minor. India, in spite of large wheat imports in 1951 and early 1952 from the U.S. and elsewhere, reported 20,000,000 persons suffering acute distress because of crop failure in Madras, Bengal, Uttar Pradesh and Rajasthan states. Floods from the delayed monsoon swept away villages, and locusts invaded about 100,000 sq.mi. of India and Pakistan.

Though Argentina and South Africa were making substantial recovery from their droughts of 1950-51, their southern hemisphere neighbour, Australia, had serious midwinter drought in its northern cattle country.

In Yugoslavia (and probably in some other eastern European areas) renewed drought cut short recovery, reduced the important corn crop by nearly one-half and resulted in further assistance to that country by the U.S., U.K. and France.

International action, partly through the Food and Agricultural organization of the United Nations, was taken in the middle east to combat a destructive plague of desert locusts. Even the U.S.S.R. assisted in Iran as did the U.S. through the Point Four program of the Technical Cooperation administration.

Emergency measures were taken in Brazil to aid migrants driven south by famine from the drought-stricken northeast, especially the state of Ceará.

Other Countries.—World food supplies in 1952 reached a new high level since World War II. This encouraging situation came about primarily because of record or near-record production in North America along with very substantial production in western Europe. It was primarily the result of favourable weather plus improved productivity on nearly fixed acreages under improved technology, fertilization, etc. Such abundant production,

particularly in North America, further distorted the world food supply-and-demand picture by adding abundance where production was already in surplus, thus creating a reserve of food somewhere in the world for those who would eat more, but at the same time tightening the dilemma of how those who needed the food could increase their productivity and effective demand. There was, as might be expected, some growth in protectionism.

Table VI.—World Food Production by Commodities and by Areas, Compared with pre-World War II

*Preliminary estimate.

A record bread grain crop, including 7,150,000,000 bu. of wheat, did much to compensate for a decline to 639,000,000 bu. from 816,000,000 bu. the previous year in the estimated wheat stocks of the principal exporting countries. Feed grain crops were good, though not excellent; corn (maize) was the second largest crop on record. World supplies of fats and oils were much eased. Cattle, hogs and sheep apparently were at new record numbers. Milk and egg production appeared to have declined slightly. Cotton production declined moderately, but some types of tobacco reached new levels.

Canada.—Canada contributed more than its usual share to the world's food in 1952. About 200,000,000 bu. of the grain crop of 1951, which could not be harvested in late 1951 because winter came very early, was recovered without serious damage during a dry spring. Then on an acreage only modestly larger than that of 1951, a record wheat crop of 688,000,000 bu. was produced, compared with the large crop of 552,657,000 bu. in 1951. Feed grain crops also were favourable, and carry-over stocks from previous years amounted to 212,975,000 bu. of wheat, compared with 189,203,000 bu. in 1951 and an average for the previous decade of 256,517,000 bu. (record in 1943 was 595,000,000 bu.). Oat stocks increased to 104,897,000 bu. from 95,177,000 bu. in 1951 and an average of 72,652,000 bu. Barley stocks were a record 76,938,000 bu. compared with 53,496,000 bu. in 1951 and an average for 1941-50 of 30,610,000 bu. Even rye was 7,676,000 bu., compared with 3,299,000 bu. in 1951 and 5,193,000 bu. for 1941-50. The value of the 1952 crop exceeded the record value of \$1,977,105,000 placed on the grain crops of 1951, of which wheat accounted for about one-third.

Latin America and the Southern Hemisphere.—Outstanding agricultural events in Latin America in 1952 included a record Cuban sugar crop of 7,900,000 tons. Argentina, normally one of the four major wheat exporters, plagued by drought and an apparently somewhat disorganized agricultural economy, imported wheat from North America. Argentina, also normally a major meat exporter, but with cattle and hogs severely reduced by more than one year of drought, ordered one meatless day per week in all public eating places. Brazil inaugurated official support for cotton and coffee at levels equal to or above existing world prices. The Rockefeller foundation extended its agricultural work in Mexico to include improvement of livestock and poultry. Cattle, milk and wheat all suffered from drought

STUDENTS examining pollen and studying growth in rice plants at Cuttack in Orissa, India, site of a rice hybridization project sponsored by the Food and Agriculture organization for improving yields

in Australia; South Africa, however, appeared to be recovering.

Western Europe.—About 16,000,000 farms and as many, perhaps, as 78,000,000 people are included in the agricultural sector of the economy of western Europe. In spite of some damage from hot, dry weather, total agricultural output, about 12% higher than before World War II, brought calories per person nearly to the prewar level of 2,870, with also a better balance in the diet than in the early postwar years. Yet the area had to import fully one-third of its food.

In France, prices in early autumn were rolled back moderately in an effort to halt inflation. The new commercial agreement with Yugoslavia included agricultural products. Cattle losses from a serious epidemic of foot-and-mouth disease were estimated in value as high as 100,000,000,000 fr. Rationing of food was reported as abolished in Spain in June, that of oil and bread having been previously lifted.

The United Kingdom situation was particularly interesting under the new government. A good number of curbs on foods were relaxed or abolished, most notably that on tea. Subsidies on foods were slashed, beginning in March, reducing them over-all 38% or about £160,000,000 by the end of 1952 to an annual rate of about £250,000,000. The cost-of-living index fell a point in August for the first time in two years—mostly because potatoes and apples were cheaper. But the rise from an index of 132 in January to 137 in August was almost entirely the result of the higher cost of food. The second instalment of subsidy cuts was due in October—it would add another 4d. to the weekly cost of one person's rations—a total addition of 1s. 4½d., compared with 1s. 6d. forecast by the year end.

Higher prices were agreed upon for several foods imported into the United Kingdom: Australian lamb and beef were higher; New Zealand meat was up an average of 12½%; Australia, New Zealand and Denmark were to get 7½% more for butter. Bacon

was to be slightly cheaper—contracted from Denmark at 252s. 6d. per hundredweight, compared with 262s. 5d. a year before—cooked ham was derationed at a controlled price of 8s. per pound compared with 12s. for canned ham. In an effort to close the dollar gap, raw material imports were cut, wheat escaped but not feeding stuffs nor cotton which for the first seven months of 1952 was £91,240,000, compared with £151,159,000 for the same period in 1951.

The Irish government removed the last of its food subsidies in July and ended rationing. Some prices increased about 50%.

Eastern Europe and the U.S.S.R.—The amount of damage to crops caused by drought in some parts of this large area was unclear, but in Yugoslavia crops suffered to a degree requiring new aid, and much of the Danube basin appeared to be somewhat similarly afflicted. In the U.S.S.R. itself, G. M. Malenkov in his October report to the 19th All-Union Communist Party congress indicated the year's grain crop at 8,000,000,000 poods, or about 130,000,000 metric tons, and perhaps 9,000,000 tons more than the rather small crop of 1951. Sugar beets and cotton were reported as larger than the 1951 crops of 27,000,000 tons for the former and 3,750,000 tons for the latter. Individually owned animals were believed to have declined in number; collections were apparently difficult, and still food prices were reported as having been cut by 10% to 30% in March. Unlike the two previous years in each of which the U.S.S.R. agreed to sell the United Kingdom 800,000 tons of grains, in 1952 the arrangement, announced in October, was for only 200,000 tons, mostly feed grains.

Middle East.—Some of this area harvested splendid crops—Turkey's record wheat crop provided a large surplus for export. Israel's food outlook was reported as improved with rising food costs curbed. A large crop was harvested in the northern Negev.

Asia.—Japan apparently had a good crop in 1952. Tibet reduced inflation, especially the price of barley, by a ban in the largest cities on the manufacture and sale of liquor brewed from barley. The rice crop was apparently a reasonably good one, but rice for export to the seriously deficient areas did not increase much. Ceylon was using modern mechanical equipment to clear land; 40,000 ac. of new rice lands were brought under irrigation. Twelve international farm experts were sent to Korea by the Food and Agriculture organization and the U.N. Korean Reconstruction agency to develop a five-year agricultural rehabilitation program.

International Agricultural Organization.—The Food and Agriculture organization continued to operate actively from Rome, It., during the year. The council of the F.A.O. met in June and approved plans for a multibillion-dollar world food reserve against drought and disaster.

The 1950 world census of agriculture, the initial planning for which began in 1945 and 1946, slowly approached fruition. As of about mid-1952, 78 countries and territories had taken a census of agriculture more or less within the proposed framework. Sixteen more were expected to take such a census in the near future. Preliminary census results from 43 countries were available. Publication of final results was planned for the second half of 1953. Sixteen European nations considered plans for a proposed European "farm pool" to increase exchange of agricultural products.

The International Wheat agreement proceeded into its fourth and final year with guaranteed quantities of about 581,000,000 bu. per year being practically all provided and taken up. But in spite of such performance there was growing concern regarding its prospects of being extended or renewed, primarily because of difference, perhaps wide difference, of opinion between exporting and importing countries as to an equitable range of

prices. The operations during recent years at maximum prices, provided in the existing agreement, represented rather heavy subsidy by exporting countries to importing countries.

The European Confederation of Agriculture held its fourth general assembly at Wiesbaden, Ger., in September. Fifty-five countries were represented at the Sixth International Grasslands congress at Pennsylvania State college, State College, Pa., in August. The International Farm Economists met at East Lansing, Mich. (*See also AGRICULTURAL RESEARCH ADMINISTRATION; BUDGET, NATIONAL; CENSUS DATA, U.S.; CHEMURGY; FRUIT; HORTICULTURE; IRRIGATION; LIVESTOCK; METEOROLOGY; PRICES; SOIL EROSION AND SOIL CONSERVATION; VEGETABLES; etc.; and also under principal crops.*) (J. K. R.)

Aircraft Manufacture. Production of military aircraft in the United States reached post-World War II record levels in 1952, as the nation's air rearmament program continued to accelerate the efforts of the aircraft manufacturing industry.

Military production was expected to total about 9,000 planes of all types by the end of the year—more than double the 4,300 military aircraft built in 1951—constituting more than 92% of all air-frame weight produced during 1952 by U.S. manufacturers and about 89% of their total sales.

The monthly output of military planes reached approximately 900 planes in September. Although several major strikes hampered production in early fall, deliveries were scheduled to reach an anticipated peak of 1,000 to 1,100 military planes per month by the end of the year.

This planned level of production obviously did not represent the maximum output that could have been achieved under all-out mobilization. It was, however, the peak called for under the revised production schedules of the air power build-up. Budgetary limitations forced a downward revision in aircraft production schedules early in 1952 which postponed achievement of the 143-wing air force and a proportionately expanded naval air arm from mid-1954 to late 1955.

Despite this so-called "aircraft production stretch-out" in Jan. 1952, however, deliveries of military planes continued to increase throughout the year toward a unit peak to be reached in December. Output, in terms of air-frame weight, was expected to rise for several months after December.

Significant was the fact that the first military planes ordered after the outbreak of hostilities in Korea rolled off production lines in mid-1952. Delivery of these planes—which were production models in 1950, the year the war started—reflected the long lead-time required for production of modern, high-performance aircraft.

By the end of 1952, however, the aircraft industry had virtually completed the initial "tooling-up" phase of the mobilization effort. It had assembled most of the machines and manpower, and had created the materials and component pipe lines necessary to meet established production schedules.

A planned expansion of the industry's production base, designed to facilitate rapid achievement of additional production in event of all-out war, was also completed in large measure during 1952. The major emphasis of this program was centred on the establishment of second sources of production for air frames, engines, propellers, plane parts and components.

Appropriations in excess of \$16,200,000,000 were provided for aircraft procurement during fiscal 1952 (July 1, 1951, through June 30, 1952) and in excess of \$16,600,000,000 in fiscal 1953. With fiscal 1951 appropriations, the three-year total

MASSIVE CONCRETE STRUCTURES for reducing the roar of jet engines being tested at a plant in Lockland, O. They were built to protect employees and near-by residents from what had been measured as the loudest industrial noise

exceeded \$42,900,000,000.

Especially important in 1952 was the fact that military funds earmarked for research and development were increased substantially over preceding years, providing for intensified work in developing supersonic aircraft, guided missiles, new armament and more powerful engines.

Although military production dominated the year's aircraft manufacturing effort, the output of private and commercial planes also showed substantial increases in 1952.

Builders of commercial transport planes reported an all-time high backlog in July 1952. In that month, they had orders from U.S. and foreign air lines for 456 multiengined transport aircraft—more than a third as many as were then operated by U.S. air lines.

This record backlog represented approximately 21,000,000 lb. of air liners (in air-frame weight) with a total sales value of about \$473,000,000. The industry had delivered 103 commercial transport planes through July and was expected to deliver 97 additional ones by the end of the year.

During 1952, several major U.S. air-frame manufacturers completed preliminary designs on jet-engined transport aircraft. Production actually was under way on the military version of a turboprop-powered transport-type plane which also had commercial air line potentialities.

Production of lighter utility-type aircraft for civil use was expected to exceed 3,100 units for the year with a sales value of about \$22,000,000. In total units, this was about 800 more light aircraft than were built (for civil use) in 1951. The light-plane industry had delivered 2,365 aircraft by the end of September.

The tremendous growth in rotary-wing aircraft activity that followed the advent of war in Korea continued in 1952. Several hundred helicopters were produced during the year (almost entirely for military services), and the backlog of unfilled orders reached \$541,000,000 compared with the 1951 backlog of about \$500,000,000.

With mounting orders for both military and civil aircraft, the sales volume of the 15 largest air-frame, engine and propeller companies was expected to reach \$5,000,000,000 in 1952, almost double the \$2,605,000,000 figure of 1951. These 15

companies were expected, however, to average approximately the same percentage of profits to sales as in 1951—2.1% compared with slightly more than 2% the previous year, which was less than half the national average. Relative low-profit margins for the aircraft industry, compared with the average for all U.S. manufacturing industries, was attributed in part to government price renegotiation and redetermination policies, as well as to the excess profits tax, the effect of strikes in both primary and component manufacturing establishments, rising wage rates, increased costs of materials and increased costs of hiring and training new employees.

Employment in the industry continued an upward climb throughout the year, although hiring dropped to an average of about 9,000 per month during the last six months of the year compared with about 16,500 per month during the preceding year and a half. This tapering-off in employment resulted from the "stretch-out" of aircraft production goals during the early part of the year.

At midyear, employment in the aircraft and parts industry itself stood at approximately 611,000 and was expected to reach 666,000 in Dec. 1952. This figure, however, did not include the employment requirements of new plants coming into operation after July 1952 or plants shifting to aircraft production in that period. With these additional facilities in production, employment was expected to exceed 700,000 by the year's end, and 835,000 by 1954.

The gravest long-range manpower problem faced by the aircraft industry in 1952 was the growing shortage of engineers and trained technicians. Constant demands for greater performance in military planes for the nation's rearmament required that 1 out of every 11 employees be engineering personnel. This was double the engineering manpower requirement during World War II. A steady decline in graduations of engineers from universities had made the problem more acute. Air Races and Records. A 48-year-old aeroplane designer from Oshkosh, Wis., won the major award at the International Air exposition sponsored by the Aero club of Michigan at the Detroit-Wayne county airport. Zooming around the 37½-mi., six-pylon course at an average speed of 197.29 m.p.h., Steve Wittman triumphed over five top pilots in the Continental Motors Trophy race. John Paul Jones of Van Nuys, Calif., victor the previous two years, was second in 1952 with a speed of 197.16 m.p.h.

Wittman gained \$2,700 for his victory in the final race on Sept. 1 in addition to \$1,500 he had won in an elimination heat when he set a record of 198.24 m.p.h. for the Continental race. The winner flew a needle-nosed 85-h.p. midget plane. Jones had established himself as the favourite when he led all qualifiers on Aug. 29, covering ten laps around a 2½-mi. octagonal layout at 203.16 m.p.h. Meet officials announced that it was the first time a midget plane had exceeded 200 m.p.h. over such a course.

Exhibitions by jet planes and army bombers were other highlights of the Labor day week-end show, one of the feature attractions for visitors being the six-jet Boeing B-47 Stratojet medium bomber, which flew a 2,025-mi. course to Detroit from the Edwards air force base at Muroc, Calif., in 3 hr. 18 min. The plane had a ground speed of 615 m.p.h. and its commander was Maj. Orville A. Maki of Ironwood, Mich. Another lure to the crowds was a ten-engined B-36 bomber that flew to the field from Spokane, Wash., via the north pole in 34 hr. 46 min.

More than 40 entrants started in the sixth annual transcontinental "Powder Puff derby" from Santa Ana, Calif., to Teterboro, N.J., airport on July 4. The 2,700-mi. race is on a handicap basis because of the differing speeds of the planes. Shirley Blocki and her copilot Martha R. Baechle, both of Long Beach, Calif., flying a Cessna 140, were declared the winners. Their elapsed time was announced as 22 hr. 38 min. Mrs. Isabelle McCrae and Mrs. Betty McNeil of Lemon Grove, Calif., were the first to land, after 17½ hr. Only 19 of the starting planes finished.

Betty Haas of Scarsdale, N.Y., triumphed in the All-Women's International race from St. Augustine, Fla., to Welland, Ont.,

landing on July 5. Miss Haas finished three minutes ahead of Mrs. Elaine Mogelvang of Lockhart, Fla.

Lieut. Com. Jack Becker, a Jacksonville, Fla., navy pilot, captured the unlimited-horsepower closed-course race that featured the Greater Miami, Fla., Air show. After annexing the opening heat at 219 m.p.h., Becker was the only one to finish the event the second day when rain and engine troubles forced out all his rivals.

Britain's greatest aerial exhibition since World War II resulted in the worst disaster in air show history when a supersonic fighter, a DH 110, disintegrated before the eyes of about 130,000 onlookers at Farnborough Sept. 6, killing the pilot, his aide and 25 spectators. Sixty-three other persons were injured. Just before the plane exploded it had plunged downward eight miles at more than 700 m.p.h. in a dive faster than sound travels. John Derry, 30-year-old ace test pilot, and Tony Richards, flight test observer for the de Havilland Aircraft company, were the crewmen. (See also AVIATION, MILITARY.)

A.L.A.: see AMERICAN LIBRARY ASSOCIATION.

Alabama. Alabama, the "heart of Dixie," was admitted to the union as the 22nd state on Dec. 14, 1819. It is bounded on the north by Tennessee, on the east by Georgia, on the south by Florida and the Gulf of Mexico and on the west by Mississippi. Called the "Cotton state" or the "Yellow-Hammer state," its area includes 51,078 sq.mi. of land and 531 sq.mi. of water.

The 1950 census gave Alabama a population of 3,061,743, compared with 2,832,961 in 1940. Of Alabama's total population, 43.8% is defined as urban and 56.2% as rural. Birmingham, with 326,037 people, is the largest city. Mobile is second with 129,009. Montgomery, the state capital, has 106,525 citizens. Other large cities include Gadsden, 55,725; Tuscaloosa, 46,396; Bessemer, 28,445; Anniston, 31,066; Dothan, 21,584; Decatur, 19,974; Huntsville, 16,437; Phenix City, 23,305; Selma, 22,840.

The principal elective officials named in 1951 to serve four years were: governor, Gordon S. Persons; lieutenant governor, James B. Allen; attorney general, Silas Coma Garrett, III; state auditor, John Brandon; commissioner of agriculture and industries, Frank M. Stewart; secretary of state, Mrs. Agnes Baggett; state treasurer, Sibyl Pool; state superintendent of education, W. J. Terry.

History.—Governor Persons took office on Jan. 16, 1951. One of the first of his actions was to abolish the use of the lash in Alabama's 35 correctional institutions. Among other accomplishments, he succeeded in increasing the 1% sales tax to 3%, the revenue to go to education; obtained a \$3 car licence tag, effective in 1953; put through a \$25,000,000 road bond issue in a state vote; and reorganized the state pardon-paroles board and the department of corrections and institutions. On Dec. 11, 1951, Alabama voters rejected a plan to reapportion the state legislature, with each of the 67 counties to have a senator, instead of the existing 35 upper-house members. A new voter qualification law was approved by 369 votes, in a ballot that attracted 120,345 voters. Although the new voter registration amendment made no mention of race, creed or colour, many contended that it was aimed at Negro voters. It required prospective voters to be of "good character," to fill out a written questionnaire and to sign an anti-Communist oath. The various county boards of registrars were to administer the law.

Education.—During the academic year 1950-51 (ending June 30, 1951) the total number of public schools in Alabama was 3,258. Total enrolment was 681,007. Of this number, 443,255 were enrolled in elementary schools and 237,752 in high schools. There were 13,332 elementary school teachers and 8,908 high school teachers. There were 9 state-supported institutions of higher learning. In the school year of 1951 there were 32,096 students

FIRST HELICOPTERS to cross the Atlantic, landing at Prestwick airport, Scot., on July 31, 1952. The U.S. air force craft took off from Westover, Mass., on July 15 but were delayed at stopover points by bad weather

REFLECTIONS in a pool of oil near Pollard, Ala., the first flowing well in the state's history. The gusher shot up early in 1952

enrolled on college campuses and a teaching staff of 1,849. Of these, 8,686 were Negroes, with teachers numbering 192. The total on- and off-campus enrolment including attendance at the university centres was 57,206, with 2,391 teachers. Of this enrolment, 9,547 were Negroes, with 256 Negro teachers. There were 10 denominational and private colleges, with an approximate enrolment of 6,778.

Social Insurance and Assistance, Public Welfare and Related Programs.—Amounts spent for public assistance categories in Alabama during the 1951-52 fiscal year (ending Sept. 30, 1952) and average number of recipients (in parentheses) during 1951-52 were as follows: old-age assistance, \$19,101,079.17 (74,834); aid to the blind, \$439,723 (1,518); aid to the handicapped, \$2,305,812.73 (8,604); aid to dependent children, \$7,610,767.63 (18,170); aid to children in foster care, \$181,545.23 (585); temporary aid, \$36,634 (133), for a total of \$29,675,561.76 for the fiscal year. Alabama's prison population on Oct. 1, 1952, the end of the fiscal year, was 4,471.

Total expenditures for the department of corrections and institutions were \$3,613,390.07.

Communications.—The state highway system included 7,805 mi. of roads. The county system had 52,641 mi. and there were approximately 3,500 mi. of municipal streets. For 1951-52 state highway department expenditures for roads were \$31,081,988.29. This included \$22,977,262.64 for construction and \$8,104,725.65 for maintenance. The estimated railroad mileage was 5,400 mi. There were 477,536 telephones in the state during the year. There were 67 public, commercial and private airports, 2 government fields (Tennessee Valley authority) and 18 that belonged to the air force and navy. Included were 1,394 mi. of controlled airways and 1,903 mi. of off-airway carrier routes.

Banking and Finance.—On June 30, 1952, there were in Alabama 158 state banks and 1 branch, with total deposits of \$320,355,573.33. Total resources were estimated at \$351,179,383.49. There were 71 national banks, 25 branches and 4 facilities, which had total deposits of \$1,009,625,000 and total resources of \$1,093,000,000. On Dec. 31, 1951, a total of 8 Alabama savings and loan associations had resources of \$13,943,560.16. On the same date, there were 71 credit unions with total resources of \$9,609,532.94.

For the year Oct. 1, 1950-Sept. 30, 1951, Alabama's net receipts from

Table I.—Leading Agricultural Products of Alabama

	Indicated 1952	1951	Average 1941-50
Cotton, bales	825,000	909,000	899,000
Corn, bu.	27,071,000	46,303,000	46,470,000
Peanuts, lb.	179,200,000	205,620,000	319,829,000
Hay, tons	487,000	556,000	739,000
Sweet potatoes, bu.	1,300,000	1,365,000	4,832,000
Irish potatoes, bu.	4,118,000	4,216,000	4,047,000
Oats, bu.	2,772,000	2,052,000	4,650,000
Soybeans, bu.	1,672,000	1,584,000	623,000
Sorghum grain, bu.	224,000	323,000	461,000
Peaches, bu.	585,000	256,000	1,036,000
Pecans, lb.	14,000,000	26,000,000	12,203,000

Source: U.S. Department of Agriculture.

all sources totalled \$249,825,654.98. Gross disbursements for the same period were \$359,243,548.75. Net disbursements were \$254,525,317.34.

Agriculture.—Alabama's total principal crop value in 1951 (exclusive of livestock, swine and poultry) was \$336,300,000, an increase of 15% over 1950. The cotton crop (lint and seed) grossed \$193,000,000 compared with \$133,000,000 in 1950; peanuts grossed \$19,000,000 in 1951. The estimated over-all value of Alabama agricultural production ranged from \$425,000,000 to \$450,000,000. Income to Alabama farmers from cattle sales was expected to be about \$50,000,000, compared with \$38,000,000 for 1950; poultry, \$30,000,000; dairy products, about \$26,000,000.

Manufacturing.—In 1951, 5,096 Alabama manufacturing establishments employed 229,000 persons. Income from pay rolls and profits was \$951,000,000. Sales or receipts totalled \$2,721,000,000. The primary metals industry employed 47,000 workers with sales or receipts totalling \$714,000,000; textiles employed 55,000 workers with sales or receipts totalling \$582,000,000; lumber, 42,000 workers with sales or receipts, \$218,000,000; food products, 15,000 workers with sales or receipts, \$305,000,000. (B. Br.)

Mineral Production.—Table II shows the revised figures on tonnage and value of mineral commodities produced in Alabama in 1949 and 1950, data for 1951 not being available, and lists all items having a value in

Table II.—Mineral Production of Alabama
(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.)	10,575,000	\$23,176,000	9,394,000	\$20,321,000
Clays	993,000	1,045,000	857,000	934,000
Coal	14,422,000	88,343,000	12,934,000	79,188,000
Coke*	5,833,000	64,332,000	5,161,000	55,493,000
Ferroadloys*	165,000	23,403,000	99,000	14,276,000
Iron ore	8,290,000	28,933,000	8,191,000	27,553,000
Iron, pig*	4,307,000	167,984,000	3,664,000	131,162,000
Lime	389,000	3,578,000	359,000	3,203,000
Petroleum (bbl.)	735,000	†	462,000	†

†Value included with other minerals.

excess of \$100,000. Alabama ranks 3rd among the states as a producer of iron ore and bauxite and stands 18th in the value of output, with 1.34% of the U.S. total.

Åland Islands: see FINLAND.

Alaska. Alaska, the northernmost territory of the United States, is separated from Siberian U.S.S.R. by the Bering strait. The boundary line follows the international date line between Big Diomed Island, which is soviet soil and in the eastern hemisphere, and Little Diomed Island, which is on the U.S. side in the western hemisphere. These islands are about three miles apart. Alaska has an area of 586,400 sq.mi. Its population according to the 1950 census was 128,643, compared with 72,524 in 1940. The gain of 77.4% in the ten-year period did not include the military, naval or coast guard personnel stationed in the territory. On the basis of figures determined by the Alaska Development board and the continuing high influx of civilians and military personnel, the population in 1952 was conservatively estimated at 160,000. The largest town is Anchorage, with a 1950 population of 11,254. Other towns and their 1950 populations were as follows: Fairbanks (5,771); Juneau (5,596); Ketchikan (5,305); Eastchester (3,096); Seward (2,114); Sitka (1,985); Nome (1,876); Kodiak (1,710); Petersburg (1,619); Wrangell (1,263).

The Aleutian Islands, a chain of small islands extending about 1,200 mi. westward from the extremity of the Alaskan peninsula, constitute part of the territory of Alaska.

History.—The most important event occurring in Alaska in 1952 was the announcement by the Aluminum Company of America of plans to construct a \$400,000,000 hydroelectric power and aluminum reduction facility in the Taiya valley near Skagway. The construction of the project would be accompanied by the establishment of a new city of 20,000 persons. The Alcoa project, in addition to the \$40,000,000 pulp mill already under construction at Ketchikan and the nearly completed plywood mill at Juneau, promised further stabilization of the economy of southeastern Alaska, previously dependent on the seasonal salmon and halibut fishing industries.

Construction activity continued to reach new highs with defense construction maintaining the lead. Projects looking toward the continued development of the territory were undertaken or further pursued, particularly in housing, road building and airport and harbour improvements. Railroad facilities underwent extensive rehabilitation and construction proceeded on the large hydroelectric installation at Eklutna near Anchorage. A congressional subcommittee held territorial-wide hearings looking toward simplification and clarification of the federal land laws. During the summer, a steamship strike of seven weeks' duration strangled the economic life of the territory and made serious inroads into the construction and tourist industries. On Sept. 7 the Canadian Pacific railroad luxury liner, the "Princess Kathleen," went aground at Lena point near Juneau and sank a few hours later without loss of life.

A statehood bill for Alaska was passed in the U.S. house of representatives in 1951 but failed of passage in the senate in 1952.

Chief officers of the territory in 1952: Ernest Gruening, governor since 1939; Joseph W. Kehoe, secretary of Alaska. Elected by the people: E. L. Bartlett, delegate in congress; Henry Roden, territorial treasurer; Frank A. Metcalf, highway engineer; J. Gerald Williams, attorney general; Henry Benson, commissioner of labour.

Education.—At the close of the 1951-52 school year Alaska had a total elementary and secondary classroom enrolment of 20,936 students and 748 teachers. Total territorial expenditure for the support of the public schools for that period, exclusive of administration and construction costs, was \$2,767,302. The commissioner of education was Everett R. Erickson.

Banking and Finance.—In the fiscal year ending June 30, 1952, territorial tax collections amounted to \$15,100,543, an increase of 34.15% over the previous year. The territorial treasury had a net cash balance of \$9,007,492.13 as of June 30, 1952. Funds of the territory were deposited in the 15 territorial and 5 national banks which had a combined capital of \$2,244,600, net undivided profits of \$1,586,623.89 and total deposits of \$124,270,559.10. The territory had no bonded indebtedness.

Agriculture.—The total value of crop and livestock production in 1952 was \$4,870,960, compared with \$2,186,233 for the previous year. Dairy products accounted for more than half of the agricultural income with livestock, vegetables, poultry products and grains following in that order. The average annual take from fur farming and fur trapping over the past ten years, exclusive of the fur seals taken under treaty regulation, was \$2,378,418.

Fisheries.—Alaska's salmon pack, considered the largest in the world, totalled 3,505,500 cases in 1952 with a value of about \$90,000,000. The halibut, shrimp, crab and cod fishery brought the total value of the sea food pack of the territory up to more than \$110,000,000 for the year.

Mineral Production.—In 1952 a sizeable iron deposit was discovered near Klukwan. During the year several major petroleum producers initiated extensive exploration programs in the territory. (ER. GR.)

The following table shows the tonnage and value of mineral production in Alaska in 1949 and 1950, data for 1951 not being available, and lists all items having values in excess of \$100,000.

Mineral Production of Alaska
(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Coal	412,000	\$3,033,000	434,000	\$3,309,000
Gold (oz.)	289,000	10,125,000	229,000	8,030,000
Sand and gravel	3,050,000	2,377,000	?	*

Albania. A people's republic in the western part of the Balkan peninsula, Albania is bounded north and east by Yugoslavia, south by Greece and west by the Adriatic sea. Area: 11,100 sq.mi. Pop.: (1930 census) 1,003,097; (mid-1951 est.) 1,200,000. Language: literary Albanian and two spoken dialects, the Gheg dialect north of the Shkumbi river and the Tosk in the south. Religion: Moslem 65%, Greek Orthodox 23%, Roman Catholic 11%. Chief towns (1949 est.): Tiranë (cap., 40,000); Scutari or Shkodër (30,000); Koritsa or Korçë (28,000); Elbasan (18,000). Chairman of the presidium of the people's assembly in 1952, Omer Nishani; prime minister, minister of foreign affairs and of national defense, Gen. Enver Hoxha.

History.—During 1952 Albania lived through another year of its precarious existence as a soviet satellite state, cut off from the rest of the eastern European bloc, without any important change of its political or economic structure. There was ample evidence that the Communist government was so preoccupied with the maintenance of the regime in power and with the problems arising from the country's isolation that it was unable to make any marked progress toward its main aims—collectivization of agriculture and industrialization. This was borne out during the second congress of the Albanian Workers' (Communist) party held in Tiranë in March and April. The prime minister, General Hoxha, who made the principal speech, declared: "We have to admit that the Two-Year Agricultural plan was not properly organized or carried out. . . . This has resulted in a decrease in the individual production of the peasants." This two-year plan (1949-50) should have been followed by a five-year plan, which was in fact officially inaugurated in 1951, but because of the regime's political instability it was not actually launched until the summer of 1952, leaving the government three and a half years in which to reach its goals. It was not surprising therefore that the Communist party congress was held in an atmosphere of almost unrelieved gloom, or that it was followed by the dismissal of four ministers for inefficiency, including Manush Muftin, deputy premier and member of the Politburo, and Iosip Pashko, minister of state control and secretary of the central committee of the party.

The theme of the country's isolation was underlined by frequent announcements throughout the year about the activities of hostile agents introduced illegally into the country by Albania's neighbours, Greece and Yugoslavia, supported by Great Britain and the United States. The government also complained of continuous frontier violations by Greek and Yugoslav troops, including armed raids on frontier villages.

Meanwhile the U.S.S.R. continued to exploit the Albanian economy to its own advantage without committing itself to Albania's defense. It consistently refused to grant Albania a mutual defense treaty. Nevertheless, although no official information was forthcoming, it became clear that there was a change in emphasis in Soviet-Albanian relations which was also reflected inside the Albanian Communist hierarchy. For the first time the Albanian press referred to the presence of non-Russian technicians in Albanian industries (Bulgarian experts were specifically named), a development which gave rise to the belief that the soviet government considered Albania too isolated and exposed for a large number of soviet engineers and technicians. The soviet minister, D. S. Chuvakhin, was recalled to Moscow, and Tuk Jakova, a former deputy prime minister who had lost his post during the ascendancy of Gen. Mehmet Shehu, the minister of the interior, returned to favour.

No settlement was reached in the dispute between Albania and Great Britain over the Corfu channel mining incident in which 44 British lives were lost in 1947.

(M. MACK.)

Education.—Schools (1949): elementary 1,910, pupils 162,000; higher elementary 145, secondary 20, total pupils 19,140; a teachers' college was opened at Tiranë in 1946; Enver Hoxha announced in Moscow in Oct. 1952 that Albania had five institutions of higher education.

Finance.—Budget (1951 est.): revenue 9,500,000,000 leks, expenditure 9,100,000,000 leks including 3,607,000,000 leks invested in the national economy. Monetary unit: lek with official exchange rates of 12.50 to the rouble and 50 to the U.S. \$1.

Transport and Communications.—Roads (1949): 1,766 mi. Licensed motor vehicles (Dec. 1950): cars 500, commercial 1,240. Railways (1951): c. 81 mi., i.e., normal gauge lines linking Durazzo with Tiranë and Elbasan via Kavajë-Peqin. Radio receiving sets (1950): 40,025.

Agriculture.—Main crops (metric tons, 1947 est.): maize 140,000; wheat 54,000; (1935-39 average): oats 10,300; barley 4,700; olives 17,000; tobacco (1939-41) 2,500. Livestock (1946 est.): sheep 1,548,000; goats 854,000; cattle 345,000; pigs 35,000; horses 50,000; asses 40,000.

Industry.—Crude oil output: (1950) 131,500 metric tons. A textile works was opened at Fier in Nov. 1951 with a planned yearly production of 20,000,000 m. of cotton fabrics. A sugar refinery was completed in 1951 at Malik with a production capacity of 10,000 tons.

Alberta. The most westerly of the three prairie provinces of Canada, Alberta was created by parliament in 1905. Area: 255,285 sq.mi., of which 6,485 sq.mi. are water; pop.: (1951) 939,501. Largest city: the provincial capital, Edmonton (1951) 158,709; metropolitan area, 172,112.

History.—The 57-member legislature wound up its business in April 1952 and Social Credit Premier Ernest C. Manning called an election for Aug. 5. It was hotly contested; the principal issue between the Social Crediters and the Liberals was their stand on the export of natural gas. The Social Crediters decided upon limited export because proven reserves had been established to meet Alberta needs for a minimum of 30 years; the Liberals claimed that export of natural gas would curtail the movement of industry to Alberta. When the returns were in, the Social Crediters had won their fifth straight election victory with 52 seats out of 61 (four new seats came from the 1950 Redistribution act which went into force in 1952). Premier Manning continued to place conservative financing ahead of Social Credit theories, and Alberta continued to enjoy unprecedented prosperity based on the oil and gas boom.

After a two-year investigation, the Alberta health survey committee made 87 recommendations, including the establishment of a complete program of health insurance, expansion of the provincial health department (to include child and maternal health, dental health and industrial hygiene) and subsidies to rural doctors. A special legislative committee made 22 recommendations for improvement of the Alberta workmen's compensation act, including elimination of the waiting period, increase of disability payments and increase of payments to child dependents.

Communication.—In 1951, at a cost of more than \$10,000,000, Alberta completed dirt work and graveling on 949 mi. of highway, surfaced 312 mi. of main highway and rebuilt 327 mi. of main and secondary roads. Plans were announced for five main north-south highways. A new bridge across the Athabasca river at Athabasca was opened June 1952 and stimulated development of the country northward.

Finance.—Bank clearings during 1951 totalled \$2,963,850,000, compared with \$2,626,870,000 for 1950; bank debits were \$6,241,574,500 and \$5,631,919,900 for those respective years.

Agriculture.—Despite the oil and natural gas boom, Alberta's production mainstay continued to be agriculture. Estimated values for 1951 (with 1950 figures in parentheses) were: over-all production, \$752,710,000 (\$561,836,000); grain, 387,613,000 bu. worth \$444,060,000 (250,183,000 bu. and \$301,048,000); fodder crops, 3,661,000 tons worth \$52,704,000 (2,186,000 tons and \$32,995,000); livestock marketings, 478,300 cattle, 82,760 sheep, 958,143 hogs worth \$166,307,000 (or \$13,950,000 more than in 1950); dairy products, \$44,182,000 (\$40,444,000).

Furs and Fisheries.—The 1951 fur crop sold for \$2,530,000, compared with \$1,888,918 for 1950. The 1951 fish harvest totalled 8,399,000 lb. worth \$862,000 (1950: 7,066,750 lb. and \$767,887).

Industry.—During 1951, 15 new industries having a total capital outlay of \$86,500,000 and providing 2,800 jobs were started. There were 750 other major industries in existence, producing in 1951 manufactures worth \$421,750,000 (1950: \$389,200,000). Trade figures for 1951, with 1950 in parentheses, were: wholesale, \$480,000,000 (\$430,000,000); retail, \$831,300,000 (\$747,690,000).

Minerals.—By 1952 Canada had become ninth among the world's oil-producing nations, and Alberta produced 96% of Canada's oil. During 1951 Alberta's wells yielded 45,915,385 bbl. of oil worth \$116,819,581, compared with 27,149,232 bbl. worth \$80,568,178 in 1950. In 1951, 1,179 wells were drilled, of which 763 became producers (1950: 1,009 drillings and 752 producers). A major discovery was reported in the Peace river district; a 711-mi. oil pipe line between Edmonton and Vancouver was under construction; uranium ore was found north of Athabasca lake. Coal production for 1951 totalled 7,661,276 tons, worth \$41,000,000 (1950: 8,118,206 tons; \$41,631,000).

BIBLIOGRAPHY.—Jean Burnet, *Next-Year Country* (1952), Ken E. Liddell, *This Is Alberta* (1952). (C. Cy.)

Alcohol, Industrial. Ethyl alcohol (methanol) continued in ample to surplus supply in 1952, with United States production apparently exceeding the 444,925,011 proof gallons of 1951. Prices declined from approximately 90 cents per gallon at the beginning of the year to about 70 cents for the natural denatured grade in tanks and less for the synthetic product derived in increasing amounts from petroleum.

The quantity of molasses required for this product decreased as production of the synthetic produce expanded. The five-year

chemical plan of the U.S.S.R. called for boosting the production of synthetic ethyl alcohol by 1955 by about 75%, compared with 1950 production. (J. K. R.)

Alexander of Tunis, Harold Rupert Leofric

George Alexander, 1ST EARL, OF ERRIGAL (1891—), British field marshal, was born on Dec. 10. He was educated at Harrow and Sandhurst and commissioned in 1911 in the Irish guards. He served on the western front during World War I, receiving the distinguished service order and the military cross. At the beginning of World War II he commanded the 1st division in France and was responsible for the evacuation of more than 300,000 men of the British expeditionary force from the beaches of Dunkirk. In early 1942 he went to Burma where he was in charge of the retreat from that country. In August of the same year he was appointed commander in chief, middle east, and it was under him that the German and Italian armies were driven out of Libya. In Feb. 1943 he became deputy commander in chief, North Africa, under Gen. Dwight D. Eisenhower and later, in Nov. 1944, supreme Allied commander in the Mediterranean area. On June 4, 1944, Rome was taken by his armies and in May 1945 Field Marshal Alexander, as he then was, signed an armistice with the defeated German commander in Italy. In 1946 he was created a viscount and in the same year took office as governor general of Canada. His term of office as governor general was twice extended, but on Jan. 28, 1952, it was announced that he was to become British minister of defense from March 1. In June he went to Korea and Japan for military discussions. He left Tokyo for the U.S. and Canada on June 18 to confer with Gen. Omar Bradley. Lord Alexander returned to London on June 25.

Alfalfa: see HAY.

Algeria. A French territory of North Africa, Algeria is situated between Morocco (west) and Tunisia (east), with the status of government-general of the French union. Total area: 846,124 sq.mi., administered in two parts: northern Algeria (80,966 sq.mi.), comprising the overseas *départements* of Algiers, Oran and Constantine; and the four territories of southern Algeria (765,158 sq.mi.). Pop.: (1948 census) 8,681,785 including 816,993 (9.4%) in the southern territories; (1951 est.) 8,930,000. Arabs and Berbers, who are Moslem, constitute 86.7% of the population; Europeans (1936) 987,252, mainly Roman Catholic; Jews (1949 est.) 130,000. Chief towns (1948 census): Algiers (cap. 315,210); Oran (256,661); Constantine (118,774); Bône (102,823); Tlemçen (69,668). Governor general in 1952: Roger Léonard.

History.—In 1952 the Algerian assembly expressed its hope for wider economic, administrative and political autonomy, but at the same time asked for further financial help from France.

A French periodical launched a campaign for "the nationalization of the Sahara." This meant that France should have direct control over the Saharan territories, many of which were in fact controlled from Algeria. Protests were voiced in Algiers.

In April the 52 persons accused of plotting against the security of the state (the Blidah conspiracy) were tried by the Algiers court, and demonstrations took place. Messali Hadj,

leader of the extremist Mouvement pour le Triomphe des Libertés Démocratiques, was sentenced to reside under surveillance in France.

The four-year plan, taking account of the increase in population, made considerable provision for the development of agricultural resources and envisaged giving certain workers professional training for jobs in France. The harvest was to a large extent enough for local requirements.

Education.—Schools (1951): pupils, primary 350,000; secondary 24,000; technical 3,000; University of Algiers, students 5,000.

Finance.—Budget (1951-52 est.): balanced at 72,000,000,000 fr. Note circulation (Dec. 1951) 71,000,000,000 fr. Algerian franc=metropolitan franc, with an exchange rate of 350 to the U.S. dollar in 1952.

Foreign Trade.—(1951) Imports 201,126,000,000 fr. (including 151,778,000,000 fr. from France); exports 121,437,000,000 fr. (including 80,266,000,000 fr. to France and 11,600,000,000 fr. to Great Britain). Principal exports: wine, cereals, iron ore, vegetables, citrus fruits, phosphates.

Transport and Communications.—Railways (1950) 4,500 km.; state roads 8,000 km.; secondary roads 26,000 km. Motor vehicles licensed (1950) 173,000. Ships entered (1951): Algiers 2,185; Oran 1,519. Aircraft landed 10,108.

Agriculture.—Main crops (metric tons, 1951): wheat 1,061,000; barley 575,000; oats 152,000; citrus fruits (1950) 250,000; olives (1950) 100,000; figs (1950) 50,000; dates (1950) 20,000; potatoes (1950) 210,000; other vegetables 250,000; tobacco (1950) 19,000; alfalfa grass 250,000; cork 50,000; wine 13,743,000 hl. Livestock: cattle 800,000; sheep 5,300,000; goats 3,200,000; horses (1950) 220,000; mules 230,000; asses 330,000; camels 150,000.

Industry.—Mineral production (metric tons, 1951): coal 250,000; iron ore 2,822,000; phosphates 769,000; zinc 21,000. Industrial production (in metric tons): cement (1951) 448,000; superphosphates (1950) 90,853,000; paper (1950) 12,000,000; pig iron (1950) 5,900,000; copper wire (1950) 3,500,000; matches (million boxes, 1950) 181,000,000; electricity, 665,000,000 kw.hr. (Hu. DE.)

United States.—When congress passed the Alien Registration act of 1940, all aliens living in the United States 30 days or longer were required to be registered and fingerprinted. During the registration period of Aug. 27 to Dec. 26, 1940, 5,009,857 aliens registered. The Internal Security act of 1950 amended the Alien Registration act of 1940, by requiring that every alien resident in the United States must report his address during the first ten days of January of each year. During 1951 approximately 2,365,000 alien reports were received, of which 100,000 were not tabulated because of incomplete information. The 1951 figures were not completely comparable with the 1940 figures since in 1951 only alien residents were required to furnish reports. The seven largest nationality groups who reported in 1951 were: Mexico (324,104); Italy (229,062); Canada (217,397); Poland (213,319); Great Britain (192,723); U.S.S.R. (126,010); and Germany (118,003).

Naturalizations.—The number of naturalizations, which declined rapidly after the peak year in 1944, for the first time took a sharp upward trend in the year ended June 30, 1952, to 88,655 or 33,939 higher than the 54,716 naturalized in the fiscal year 1951. One factor that changed the trend was the immigration of war brides and displaced persons after the termination of World War II. Many of these immigrants had lived in the United States long enough to meet the residence requirements and were becoming eligible for naturalization. Other factors probably accelerated alien interest in naturalization: (1) the military situation in Korea; (2) the alien address program, which reminded aliens of their alien status; and (3) the fact that companies engaged in defense production hired only citizens or aliens who had made a declaration of intention to become a citizen.

Of the 88,655 persons naturalized, 26,920 were naturalized under the general provisions of the nationality laws. Two-thirds of those who received certificates were persons married to citizens. This group, no doubt, included many war brides who had come to the United States since World War II. A total of 1,585 were military naturalizations.

Three-fourths of the 2,163 petitions denied were rejected

because the petitioners withdrew or failed to prosecute the petition. Another principal cause of denial was lack of knowledge and understanding of the fundamentals of the history, principles and form of government of the United States. All except 4 of the 279 certificates of naturalization revoked during the year were initiated by the foreign service of the state department because naturalized citizens became residents of foreign states within five years of naturalization. In 4 cases action was initiated by the immigration and naturalization service because naturalization had been fraudulently or illegally procured. In addition to those persons whose United States citizenship was revoked, there were 3,265 persons who expatriated themselves by affirmative action; 1,186 by voting in a foreign political election or plebiscite; 676 through residence in a foreign state; 622 by naturalization in a foreign state; 370 by serving in the armed forces of a foreign state; and 411 for other reasons.

Principal Countries of Former Allegiance of Persons Naturalized in U.S.

Former nationality	Years ended June 30				
	1952	1951	1950	1949	1948
British	14,993	10,867	12,697	13,284	12,361
German	13,538	5,439	6,065	5,777	7,486
Canadian	10,004	5,872	5,882	5,347	3,860
Italian	9,720	5,975	8,743	8,301	9,452
Polish	5,858	3,100	3,793	4,371	5,136
U.S.S.R.	2,851	1,830	2,122	2,752	3,143
Mexican	2,496	1,969	2,323	2,227	1,895
Filipino	1,813	1,595	3,257	3,478	5,768
Other	27,832	18,069	21,464	21,057	21,049
Total	88,655	54,716	66,346	66,594	70,150

New Legislation.—The major legislative project of the fiscal year continued to be the work begun early in 1950 on omnibus bills having for their purpose the recodification, and in many particulars the revision, of existing laws relating to immigration and nationality. These bills culminated in H.R. 5678, 82nd congress, which was enacted over the president's veto on June 27, 1952, and became public law 414. The Immigration and Nationality act of 1952 recodified and amended most of the existing laws on the subject.

Other public laws introduced in the 82nd congress relating to or affecting the work of the service and enacted during the year included the act of July 12, 1951 (public law 78), amending the Agricultural act of 1949; the act of Oct. 19, 1951 (public law 181), terminating the state of war between the United States and Germany; the act of March 20, 1952 (public law 283), creating a penalty for harbouring or concealing illegally entered aliens, and making it a criminal offense to transport certain illegally entered aliens with knowledge of such status; the act of April 9, 1952 (public law 307), making special quota immigration visas available to certain alien shepherders; the act of June 18, 1952 (public law 395), facilitating the acquisition of detention facilities. (See also IMMIGRATION AND EMIGRATION; LAW.)

(A. R. MY.)

United Kingdom.—The number of aliens registered in the United Kingdom on June 30, 1952, was 384,488 (males 229,917; females 154,571), of whom 128,546 were living in the metropolitan police district (London). The figure on June 30, 1951, had been 411,238 and on Jan. 1, 1952, was 401,151. The principal nationalities represented on June 30, 1952, and the number of each compared with the corresponding figures at the same date in 1951 were: Austrian 9,243 (10,348); Czechoslovak 4,441 (6,103); Danish 4,142 (5,255); Dutch 8,524 (9,360); French 15,225 (16,342); German 42,433 (45,285); Hungarian 4,101 (4,760); Italian 31,379 (25,396); Latvian 11,934 (13,436); Lithuanian 5,436 (6,388); Norwegian 5,258 (5,485); Polish 129,575 (143,253); Russian, including White Russian, 24,477 (26,078); Spanish 4,210 (4,016); Swiss 12,579 (12,933); U.S. 17,318 (17,400); Yugoslav 8,743 (9,431). The total included more than 7,000 aliens to whom no nationality could be attributed.

The number of incoming foreign travellers to the United Kingdom in the 12 months up to Sept. 30, 1952, was 811,211,

compared with 756,579 for the 12 months previous to Sept. 30, 1951.

In April 1952 the immigration inspection of passengers coming from Northern Ireland and the Republic of Ireland to Great Britain was abolished. In the same month an arrangement was made with the other signatories of the Brussels treaty—Belgium, France, Luxembourg and the Netherlands—to waive the requirement of individual passports for persons under the age of 21 travelling in a party of from 5 to 50 persons (excluding the leader) from one of the five countries to visit any of the others. Consular conventions with the United States and Sweden came into force in Sept. 1952. In October the United Kingdom concluded a visa abolition agreement with Turkey. As a result of earlier agreements, the nationals of the following countries were not required to obtain visas to travel to the United Kingdom: Belgium, Cuba, Denmark, France, Iceland, Italy, Liechtenstein, Luxembourg, Monaco, the Netherlands, Norway, San Marino, Sweden, Switzerland and the United States.

During the first nine months of 1952 nearly 26,000 permits were issued to allow foreigners to come and work in the United Kingdom for periods of varying length. Nearly 15,000 of these were for domestic employment in private households, hospitals and institutions, 2,700 for posts in industry and commerce and 2,700 for entertainment engagements. In addition, the recruitment of Italian men to work in undermanned industries continued.

From Jan. 1, 1952, the 15,000 former members of the German armed forces, 8,500 former Ukrainian prisoners of war and 1,000 Italian former prisoners of war who volunteered to remain in the U.K. to work in agriculture, instead of accepting repatriation at the end of 1948, were free to take any work they could obtain. In June 1952, former members of the Polish forces who were allowed to remain in the United Kingdom after demobilization, but who were subject to certain restrictions on their freedom to set up in business or to take employment, were released from these.

Between Jan. 1 and Oct. 1, 1952, 4,171 new applications for naturalization were lodged, compared with 3,576 for the same period in 1951. Certificates granted during the same period numbered 2,533. During the same period 3,712 foreign women who had married British subjects and 695 minors acquired British nationality by registration as citizens of the United Kingdom and colonies, compared with 4,528 and 768 respectively during the first nine months of 1951. (T. G. W.)

Alimentary System, Disorders of: *see* STOMACH AND INTESTINES, DISEASES OF THE.

Allergy. The scope of allergy had widened by 1952 to include a number of diseases in which allergic reactions may play an important role. This group includes rheumatic fever, periarteritis nodosa and several others referred to as collagenous diseases.

The cause of these conditions is related to development of hypersensitiveness to certain bacteria or drugs. This hypersensitiveness brings about changes in the connective tissue of the walls of arteries and elsewhere in the body.

Much work had been done on the role of the adrenal glands in allergic manifestations. In acute allergic disorders, such as severe, intractable asthma, nasal allergy, and urticaria, corticosteroids such as ACTH and cortisone are helpful in treatment. However, the administration of these drugs is not without danger and they should not be prescribed for ambulatory patients. It is necessary to hospitalize the patient and to study him carefully before the drugs are given. He must be watched continuously during the period of drug administration. Hormone

therapy is not a substitute for the proper and adequate study and management of the allergic patient. It is, rather, a procedure which should be used in emergencies and only for a relatively short time.

Intermittent positive pressure oxygen therapy had been used a great deal in the treatment of certain complications of bronchial asthma, such as pulmonary emphysema. This work was stimulated by an increased awareness of the role which these secondary changes play in the continuation of asthmatic manifestations.

The medical profession was becoming increasingly aware of the importance which drugs play in producing allergic manifestations. Whenever a patient develops unusual manifestations during the course of treatment for any condition, there exists the possibility that the very drugs that are administered to that patient for the relief of his symptoms may be responsible for the new symptoms. More and more, the problem was becoming not what drugs to give, but what drugs to cut. For example, the ointments which are prescribed for the relief of itching in allergic dermatoses may aggravate and contribute to the patient's symptoms.

Focuses of infection were believed to play a relatively unimportant role in the causation of allergic manifestations. If a patient has bad or abscessed teeth or bad tonsils, they should be removed, not because he is allergic but because such infections in themselves constitute an indication for the procedures.

Sensitization tests, such as skin testing, were believed to be important in the diagnosis of allergy, and yet by themselves do not constitute an allergic diagnosis. They are merely a guide which should be used in conjunction with the findings obtained from the history, physical examination, trial diets and environmental changes in directing the course to be followed in the management of the allergic patient.

The therapeutic results obtained in the treatment of children demonstrated the importance of the early diagnosis and early management of allergy in infants and children. No child or infant is too young to be subjected to a proper study of an allergic condition, because such early treatment may avoid complications which might make treatment difficult later on.

Almonds: *see* NUTS.

Aluminum. World production of aluminum increased by 19% in 1951, with 38% of the increase in the United States, 16% in Canada, 16% in Germany and 10% in France. Great Britain was the only major producer showing a drop in output.

Table I.—World Production of Aluminum

	(In thousands of short tons)						
	1945	1946	1947	1948	1949	1950	1951

United States.—The salient statistics of the aluminum industry in the United States, as reported by the U.S. bureau of mines, are shown in Table II.

Although production increased in each succeeding quarter from the end of 1949 to mid-1952, demand was consistently

ALUMINUM COAL BARGE built complete in England, being transported by diesel tractor en route to Cardiff for export. Steel shortages resulted in a shortage of barges but the aluminum alloy had advantages over steel, including resistance to corrosion

ahead of supply. The output in the first nine months of 1952 reached 701,961 short tons, 11% over that of the same period of 1951, with 14 reduction plants in operation in June 1952. In Aug. 1952 the price of aluminum was increased 1 cent per pound, to 19 cents for pig and 20 cents for ingot. (G. A. Ro.)

Ambassadors and Envoys. The following is a list of ambassadors and envoys to and from the United States, as of Oct. 1, 1952.

To the United States	Country	From the United States
*Naim, H. R. H. Sardar Mohammed . . .	Afghanistan	*Ward, Angus
*Paz, Hipólito J.	Argentina	*Nufér, Albert F.
*Spender, Sir Percy C.	Australia	*Jarman, Pete

American Citizens Abroad. The number of United States citizens residing abroad during 1952 increased from 439,950 to 522,788—adding more than 82,000 persons to the colonies outside the United States. The increases were noted in each of the geographic areas reported in the table, with Canada, Iceland and Newfoundland showing the greatest increase, and the European area second in volume.

The coming into effect of the Treaty of Peace with Japan and of the administrative agreement, April 28, 1952, abolished the requirement of military permits for travel to Japan and opened the way for normal travel by means of passports, visaed by Japanese consular officers for civilians other than members of the armed forces component. Bearers of passports showing status as members of the armed forces component did not require Japanese visas for residence in Japan. Certain similar exceptions were made for dependents of military and civilian personnel.

On May 1, 1952, notice was issued to the public that thereafter passports would not be valid for travel to Albania, Bulgaria, China, Czechoslovakia, Hungary, Poland, Rumania or the

Estimate of American Citizens Residing Abroad

	Jan. 1, 1951	Jan. 1, 1952

American Library Association. The American Library association (A.L.A.), official organization of librarians in the United States and Canada, had a membership in 1952 of more than 21,000 from the U.S. and possessions, Canada and more than 50 foreign countries, and was affiliated with more than 70 other library associations throughout the world. In 1951 the association had an endowment capital of approximately \$2,163,000 and a total income of about \$904,000.

Headquarters are located at 50 E. Huron St., Chicago 11, Ill., with David H. Clift as executive secretary and Mrs. Grace Stevenson as associate executive secretary.

The annual midwinter meeting of the association was held in Chicago, Jan. 29–Feb. 2, 1952. A near record attendance of 5,212 was registered at the 71st annual conference in New York city, June 29–July 5, 1952. Future conference plans called for a midwinter meeting in Chicago, Feb. 2–7, 1953, and annual conferences in Los Angeles, Calif., June 21–27, 1953, and Miami Beach, Fla., June 18–27, 1954.

Officers, elected by ballot, who assumed their duties at the annual conference were: president, Robert B. Downs, University of Illinois library, Urbana; first vice-president and president-elect, Flora B. Ludington, Mount Holyoke College library, South Hadley, Mass.; second vice-president, Lucile M. Morsch, Library of Congress, Washington, D.C.; and treasurer, Raymond C. Lindquist, Cuyahoga County Public library, Cleveland, O.

The annual A.L.A. citations for distinguished service as library trustees were awarded to Mrs. A. J. Quigley, Seattle, Wash., and Harold J. Baily, Brooklyn, N.Y. The 31st Newbery medal was given to Eleanor Estes for *Ginger Pye*, judged to be the most distinguished children's book of 1951. Nicholas Mordvinoff received the 15th annual Caldecott medal as illustrator for *Finders Keepers*, chosen as the best illustrated children's volume of the year.

Carl Vitz, chief librarian of the Cincinnati Public library, Cincinnati, O., received the Joseph W. Lippincott award (\$500) for outstanding professional achievement in the field of librarianship. The Margaret Mann citation, established in 1951 by the A.L.A. division of cataloguing and classification, was given to Marjorie L. Prévost, for distinctive professional attainment in cataloguing and classification.

The Ada McCormick *Letter* librarian award (\$100) went to Charlemae Rollins, children's librarian, George Hall branch, Chicago Public library, for an outstanding demonstration of the human qualities of librarianship. The Fitchburg Youth library, Fitchburg, Mass., received the *Letter* library award. Ten libraries were presented with the 1952 John Cotton Dana Publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. public relations committee, for effective public relations programs. The Field citation for library recruiting (\$100) was awarded to the Indiana Library association for the most effective recruiting of library personnel in 1951.

During 1952 the A.L.A. sponsored discussion programs, under local public-library leadership, on the American heritage and its application to present-day problems. This project was financed by a grant from the Fund for Adult Education, which was established by the Ford foundation. Six regional and local libraries, representing various types of communities, were chosen for the first year's demonstration. With an additional grant for 1952–53 the project activities would be expanded on a state-wide and regional basis and would include discussion programs on the American heritage for young people.

The A.L.A. received an additional grant of \$24,700 from the Fund for Adult Education for a survey of adult education

activities in public libraries.

The association continued to be concerned with the extension of complete and adequate library service for all citizens; censorship and intellectual freedom as applied to libraries; educational use of television; and the recruiting and training of librarians. During the year it worked actively with the American Book Publishers council on librarians' and publishers' mutual problems, and participated in the national nonpartisan register and vote campaign sponsored by the American Heritage foundation and other national organizations. A.L.A. also continued to co-operate with the U.S. state department in its information libraries program and the exchange of persons and books activities; administered the Japan Library school at Keio university, Tokyo; approved new minimum salary standards for professional librarians; and introduced in the U.S. house of representatives a new library services bill (S. 1452), which was designed to promote the further development of public library service in rural areas. (*See also* LIBRARIES.) (D. H. C.)

American Literature. The interest generated by a presidential election in the United States affected the literary scene of 1952. The concern with political matters which characterized nonfictional writing made even clearer the indifference to them which characterized fiction.

Writers approached politics from a number of angles: sociological, historical, psychological and anecdotal. Foreign correspondents wrote most frequently of the world situation as it related to the "cold war" and U.S. policy. There was also a natural flow of campaign literature.

In fiction the swell of novels about World War II seemed to have subsided without ever having reached the number or the excellence of those which came out of World War I. The south, rather than politics or war, was the topic of the most conspicuous group of novels. Two novelists of established reputation, Ernest Hemingway and John Steinbeck, produced new volumes. Two American literary events of unusual significance were the publication of the Revised Standard Version of the Holy Bible and "Great Books of the Western World."

Although most nonfiction writers concentrated on the American scene, there were several excellent reports on world affairs. Out of his years of political observation William L. Shirer wrote *Midcentury Journey*, a survey of western Europe's years of conflict. Leland Stowe's *Conquest by Terror* described the situation in the satellite countries of the U.S.S.R. L. S. Stavrianos' *Greece: American Dilemma and Opportunity* was a scholarly history of Greece during and since World War II and a criticism of the United States foreign policy there. Ray Brock reported on the struggle between the U.S.S.R. and the western powers for control of the middle east in *Blood, Oil and Sand*. Justice William O. Douglas recorded his visit to China and his views on the far east in *Beyond the High Himalayas*. Thomas E. Dewey's *Journey to the Far Pacific* approved U.S. foreign policy but stressed the dangers of trying to force Asia into western moulds. Among the strangely few books on the Korean conflict were *Battle Report* by Walter Karig and others, a continuation of a series drawn from official sources on World War II naval operations; and *The Hidden History of the Korean War* by I. F. Stone, an unorthodox analysis. *The Pattern of Responsibility*, edited by McGeorge Bundy, showed what lay behind the state department's actions, by selections from Secretary Dean Acheson's records.

The American Scene.—Perhaps the largest group of books about the American scene were expert analyses from special points of view. Robert Morrison MacIver, a sociologist, in *Democracy and the Economic Challenge* argued for a mixed economy. George A. Graham, a political scientist, presented a

thoughtful and scholarly discussion of corruption and moral standards in *Morality in American Politics*. Reinhold Niebuhr, a theologian, in *The Irony of American History* surveyed the failure of democratic accomplishments to keep pace with democratic theories. David Riesman, another sociologist, and Nathan Glazer, in *Faces in the Crowd*, anatomized the American personality as seen in a group of interviews, with emphasis on the correlation of political and personality patterns. Curtis D. MacDougall followed the point of view of the social psychologist in his *Understanding Public Opinion*. Herbert Agar, in *A Declaration of Faith*, urged the historical precedent of respect for the individual conscience. Frederick Lewis Allen's *The Big Change*, written in popular style, traced the economic and political transformation of the United States from 1900 to 1950. *The Future of American Politics*, by Samuel Lubell, was based on interviews and on a close statistical study of election returns of past years. Francis Biddle, in *The Fear of Freedom*, reviewed anti-subversive measures and found them sometimes dangerous to freedom. Jerome Davis' *Peace, War and You* presented the Quaker positive moral program for meeting the world's economic needs.

Other books treated more specific aspects of the national scene. Although Virgil W. Peterson's *Barbarians in Our Midst* was a history only of Chicago crime and politics, it was presented as a typical big-city pattern. Merle Miller, in *The Judges and the Judged*, analyzed and documented the paralyzing effect of the black list on radio and television writers and performers. Marquis Childs's *The Farmer Takes a Hand* was the story of the Rural Electrification administration's crusade to bring electricity to farms. *South of Freedom*, by Carl T. Rowan, described a northern Negro reporter's experiences in the south. Henry Kraus's pleasant *In the City Was a Garden* was an account of co-operative living in a housing project. Baker Brownell, in *The College and the Community*, blamed urban living for the failure of individuals to function as whole human beings.

Of books about the natural world, George Gamow's *The Creation of the Universe* posited a continuous evolutionary process and Harold C. Urey's *The Planets* discussed a theory of the origin of the solar system. Henry Chapin and F. G. Walton Smith traced the effect of the Gulf stream on climate and economy in *The Ocean River*. Marston Bates's *Where Winter Never Comes* offered a charming apologia for life in the tropics as well as an account of their geography, history, flora and fauna. Joseph Wood Krutch, in *The Desert Year*, chronicled the natural observations of a sabbatical year spent in New Mexico. Leonard Dubkin recorded his minute acquaintance with an albino bat in *The White Lady*.

An important work on American art was Hugh Sinclair Morrison's *Early American Architecture* which covered the period from the first colonial settlements of the Atlantic coast, the south, and west up to national times, and quoted extensively from contemporary diaries and chronicles. Carl W. Condit, in *The Rise of the Skyscraper*, made a technical and aesthetic study of America's contribution to world architecture. Arnold Hauser published a two-volume *Social History of Art*, discussing all forms of art from cave drawings to movies, with emphasis on art as the expression of the character of each age. Lloyd Goodrich wrote an excellent appreciation of a U.S. painter in *John Sloan*. Barry Ulanov's *A History of Jazz in America* was encyclopaedic in its scope and detail. Alice Evans Field wrote *Hollywood, U.S.A., from Script to Screen*, describing all the actual processes and technical factors of making a movie.

The field of biography and reminiscences was dominated by campaign literature. Prominent items were Noel Fairchild Busch's *Adlai E. Stevenson of Illinois* and John Gunther's

Eisenhower: the Man and the Symbol. The most controversial book of memoirs was Whittaker Chambers' *Witness*, a political and spiritual autobiography which added an essential document to the recent group of books on radical activities and the Alger Hiss case. Elizabeth Wallace wrote about a long life of teaching, travel and literary acquaintances in *The Unending Journey*. Ted Allan and Sydney Gordon wrote about Norman Bethune, who initiated the mobile blood bank, in *The Scalpel, the Sword*. Otto Kallir edited the artist's random reminiscences in *Grandma Moses: My Life's History*. Two theatrical autobiographies were *Tallulah: My Autobiography* by Tallulah Bankhead and *Dance to the Piper* by Agnes de Mille. Robert Payne recorded the life and achievements of Charles Chaplin in *The Great God Pan*.

Historical Works.—In 1952 significant biographies dealt with figures of the Revolutionary and Civil War periods. Edwin Thomas Martin wrote *Thomas Jefferson: Scientist*, interesting not only as biography but also as a chapter in the history of science. Howard Swiggett's *The Extraordinary Mr. Morris* gave an unbowdlerized picture of the founding father. Zoltán Haraszti, in *John Adams and the Prophets of Progress*, drew on a mass of hitherto unpublished marginalia as well as published writings to present the mind of John Adams and to establish his greatness as a political thinker. Douglas Southall Freeman added a fourth volume to his monumental *George Washington, A Biography*. The first work incorporating the new Lincoln material from the Library of Congress appeared, a one-volume biography, *Abraham Lincoln* by Benjamin P. Thomas. Another important item in the Lincoln bibliography was Thomas Harry Williams' discussion of the Civil War president as a military strategist in *Lincoln and His Generals*. A Civil War biography which had considerable popular appeal was Nina Baker's *Cyclone in Calico*, the story of Mary Ann Bickerdyke, the first field hospital nurse in U.S. history.

The flow of memoirs and collected papers continued. The fifth volume of *The Papers of Thomas Jefferson* appeared, edited by Julian Boyd and others. Elting E. Morison edited volumes v and vi of *The Letters of Theodore Roosevelt*, covering the years of the big stick. Herbert Hoover's *Memoirs: The Great Depression, 1929-1941* dealt with the origins of the depression, the campaign of 1932 and its aftermath. Arthur H. Vandenberg, Jr., edited *The Private Papers of Senator Vandenberg*. *Mr. President* was an authorized selection by William Hillman from the personal letters, diaries and papers of Harry S. Truman. Samuel I. Rosenman's *Working with Roosevelt* was a leisurely reminiscence of Franklin D. Roosevelt. Irving Dilliard collected papers and addresses of the jurist Learned Hand into *The Spirit of Liberty*.

Lynn Montross, in *Rag, Tag and Bobtail*, presented a new slant on the Continental army from 1775 to 1783 by drawing his material from diaries and documents of ordinary citizens in the army. Ola Elizabeth Winslow, in *Meetinghouse Hill, 1630-1783*, discussed the function of the pulpit as a sounding board for early New England theocracy. Bruce Catton's *Glory Road* told the story of the Army of the Potomac from Fredericksburg to Gettysburg. *The Negro Freedman*, by Henderson Hamilton Donald, studied the American Negro during the early years after Emancipation, finding that in slavery there had been no preparation for the adjustment to freedom. *The Diary of George Templeton Strong*, edited by Allan Nevins and Milton Halsey Thomas, gave the reader a contemporary eyewitness report on mid-19th century New York city. Among books of broader scope were Herbert Joseph Muller's *The Uses of the Past*, which presented profiles of former societies, and *Economic Forces in American History*, in which George Soule organized vast statistical information.

Fiction.—Although the year in fiction was characterized by

many new names, the most welcomed novel of the year was Ernest Hemingway's short work, *The Old Man and the Sea*, the spare, and often moving, story of an old fisherman's venture beyond known waters to catch a giant marlin, the catch a triumph in spite of the gradual destruction of the fish by sharks on the way home.

John Steinbeck returned to American readers with *East of Eden*, a large uneven novel which combined a history of his own family in the Salinas valley with portraits of a very good man and a very bad woman. Ralph Ellison's first novel, *Invisible Man*, roused a good deal of interest by its use of satire, violent humour and social observation in the story of a Negro's search for spiritual bearings. Gore Vidal's *Judgment of Paris*, in which a footloose young American pursues the three goddesses through contemporary European society, showed a growth in the writer's power.

The most conspicuous group of writers were southerners, whose works, while not uncritical of the good old ways, assumed values distinctly southern and often aristocratic. The level of writing varied enormously but probably none of it equalled that of such southerners as William Faulkner, Carson McCullers and Caroline Gordon. Of these, Elizabeth Spencer's *This Crooked Way* had considerable distinction, being three versions of the ambitious marriage of a poor man who comes down to the delta and fights his way to success. John Burrell, in *Little Mule*, pictured the struggle of a little boy in a poverty-stricken family to take his dead father's place on the farm. *The Alexandrians*, by Charles Mills, covered a hundred years in the life of a small aristocratic community. The impact of a young preacher on the

emotions of his lady parishioners is analyzed in both Lael Tucker's *Lament for Four Virgins* and Worth Tuttle Hedden's *Love Is a Wound*.

The year saw *Sironia, Texas*, by Madison Cooper, represented as the longest American novel ever published. But it also saw a solid group of excellent books distinguished for their conciseness. Jean Stafford's *The Catherine Wheel*, in spite of its rather melodramatic ending, was a controlled and effective study of a woman and her relationship to the children of a man she may marry. Wright Morris, in *The Works of Love*, created a striking character who fumbles for and cannot grasp the love of a woman or a son. The hero of Barnaby Conrad's *Matador* loses his life when he pushes beyond the limits of his art. Foibles of both the academic world and the liberal intellectual were anatomized in Mary McCarthy's *The Groves of Academe*. Isabel Bolton portrayed with skilful delicacy an old woman reviewing her life in *Many Mansions*. Two books whose excellence far transcended their type were H. L. Davis' *Winds of the Morning*, basically a western about an old man wrangling horses through the Columbia river country; and Michael Blankfort's *The Juggler*, a detective story, set in Israel, of a new immigrant's flight both from his nazi prison camp past and the detective who is pursuing him for his attempt to murder a policeman.

Two writers in considerable favour in recent years brought out books which added little to their stature. Paul Bowles, in *Let It Come Down*, presented a disillusioned bank clerk mixed up with criminals and spies in Tangier. Frederick Buechner, in *Seasons' Difference*, told of a young man's mystic vision and his attempts to make others see it.

Of novels whose chief interest lay in their special settings or milieux, Edna Ferber's *Giant* was the most sensational, largely because of the animosity it aroused in the inhabitants of Texas,

TENNESSEE WILLIAMS (right), U.S. playwright, with Christopher Isherwood, English novelist, at one of the literary cocktail parties of the book trade in 1952. Williams was elected to life membership in the National Institute of Arts and Letters on Feb. 7

the subject of her criticism. Pat Frank wrote about a heroic retreat from a Korean front in *Hold Back the Night*, one of the year's few war novels. At the other extreme was Carl Jonas' *Jefferson Selleck*, an attempt to re-create, by a first-person narrative, the life and minor troubles of an amiable Babbitt. Thomas Sterling, in *Strangers and Afraid*, created characters far more complex and real than the usual sociological Negro types. Granville Hicks portrayed rural democracy in *There Was a Man in Our Town*. *The Spire*, by Gerald Warner Brace, was a satirical picture of a New England college and its people.

The most popular of the year's historical novels was Thomas Bertram Costain's *The Silver Chalice*, a story of Joseph of Arimathea and the Holy Grail. Truman Nelson's *The Sin of the Prophet* was a fictionalized account of Theodore Parker and the Abolitionists in Boston. *The Gown of Glory*, by Agnes Sligh Turnbull, concerned a preacher in a small Pennsylvania town during the early 20th century. Clyde Brion Davis' *Thudbury; an American Comedy* was social history of the same era as seen in the life of an upstate New York magnate.

Among collections of short stories and sketches one of the most popular was James Thurber's *The Thurber Album*, centred around the Columbus, O., of his youth. There was the posthumous publication of Gertrude Stein's *Mrs. Reynolds, and Five Earlier Novelettes*. The stories in Dawn Powell's *Sunday, Monday and Always* were biting satires. *Some Others and Myself*, by Ruth Suckow, included seven stories and a memoir of her life in the midwest. Langston Hughes's *Laughing to Keep from Crying* was a group of stories, many of them funny, about Negroes in different parts of the world. Eleanor Clark's *Rome and a Villa* was a series of sketches re-creating Rome.

Scholarship.—The year in scholarship brought a number of biographies and critical studies of major American writers. Leon Howard, in *Victorian Knight-Errant*, studied the early literary career of James Russell Lowell. Several items were added to the growing Melville library: Lawrance Thompson, in *Melville's Quarrel with God*, argued a new interpretation of his whole literary career; Merrell Davis studied one book thoroughly in *Melville's Mardi*; Luther Mansfield and Howard P. Vincent edited *Moby-Dick* with voluminous notes. The "American Men of Letters Series" added Richard Volney Chase's *Emily Dickinson*. *Sam Clemens of Hannibal*, the first volume of a biography projected by Dixon Wecter, was a superb picture of Mark Twain's formative years and of the town which was so rich a source of material for him. On the border line of belles lettres and Americana was James Monaghan's *The Great Rascal*, a portrait of Ned Buntline, the dime novelist and promoter of Buffalo Bill.

Studies of 20th-century figures included Mark Harris' *City of Discontent*, a re-creation of Vachel Lindsay's Springfield, Ill. Ellsworth Barnard surveyed the poet's entire works in *Edwin Arlington Robinson, a Critical Study*. Harold Watts, in *Ezra Pound and the Cantos*, upheld the integrity of the work but admitted flaws. Carlos Baker's *Hemingway: the Writer as Artist*, while it included some biographical material, concentrated on the writer's ideas and theories. Irving Howe's *William Faulkner: a Critical Study* augmented the reputation of a leading novelist; Rossell Hope Robbins' *The T. S. Eliot Myth* derogated that of a leading poet.

Among more general works a landmark was *The Confident Years: 1885-1915*, the completing volume of Van Wyck Brooks's distinguished "Makers and Finders: A History of the Writer in America, 1800-1915" series. Edward Charles Wagenknecht's *Cavalcade of the American Novel* was a critical history in terms midway between those of the sociological and the "new" critics. John Gassner edited the third volume of *Best American Plays* with an introductory survey of the American theatre since the

end of World War I. Orville Prescott's *In My Opinion* was an inquiry into the contemporary novel.

Conrad Aiken's *Ushant* was part biography, part work of art, and part expression of his poetic life. *The Necessary Angel*, by Wallace Stevens, was a group of essays on reality and imagination. Paul Hindemith, in *A Composer's World*, discussed the theory and nature of music.

Collections of letters included *The Letters of Hart Crane and From Main Street to Stockholm*, Sinclair Lewis' letters to his publisher. Richard Beale Davis edited Chivers' *Life of Poe* and Dixon Wecter edited and wrote an introduction for Mark Twain's *Report from Paradise*.

Poetry.—Two collections by eminent poets appeared during the year, Wallace Stevens' *The Man with the Blue Guitar* and Marianne Moore's *Collected Poems*. A new volume in the "Yale Series of Younger Poets" was W. S. Merwin's *A Mask for Janus*, which reflected not too sombrely on the desolation of our times. Samuel Yellen's *In the House and Out* was also tinged with a sense of doom. Thomas Hornsby Ferril's *New and Selected Poems* used American themes and folkways. Ernest Kroll wrote *Cape Horn, and Other Poems*. The lyrics of Robert Hillyer's *The Suburb by the Sea* were pleasant and relaxed. Other volumes included Shirley Barker's *A Land and a People*, on New England themes, and Joseph Bennett's *Decembrist*. Babette Deutsch's *Poetry in Our Time* was a history of contemporary English and American poetry; and Louise Bogan's survey, *Achievement in American Poetry, 1900-1950*, contained extended criticism of Pound and Eliot. Andorra. A small autonomous principality between France and Spain, Andorra is bounded north by the departments of Ariège and Pyrénées Orientales, and south by the Spanish province of Lérida. Area: 191 sq.mi. Population (1952 est.): 6,000. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja (pop., 1952 est. 600). Co-princes: the president of the French republic and the bishop of Urgel, Sp., respectively represented by their *viguiers*. An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946, Francisco Cayrat).

History.—Twelve out of 24 members of the general council were re-elected on Dec. 15, 1951. Only the heads of families voted. This system had been replaced in 1933 by universal

suffrage, but in 1941, as a result of an agreement between the French Vichy government and the bishop of Urgel, Andorra returned to the old system.

Jean Menant was appointed French *viguier* in succession to André Bertrand; he was sworn in at a solemn sitting of the general council and the syndics did him homage. Jaime Sansa Nequi continued to serve as the Spanish *viguier*.

The 60 French *gardes mobiles*, stationed in the territory from autumn 1944, left Andorra. The population of Las Escaldas, a township rapidly growing since 1946, exceeded that of Andorra-la-Vieja.

Angling. In 1951, 16,026,699 fishing licences were sold in the United States, representing a gross cost of \$35,554,285 to anglers, including special permits, trout stamps, etc. Michigan and Wisconsin were over the 1,000,000 mark in total number of licences sold, but California derived the largest income, with \$2,986,352.

The 44th annual national casting tournament was held at Peoria, Ill., Aug. 20-24, 1952. The distance trout fly event was won by John Dieckman with a long cast of 165 ft. and an average of 159½ ft.; the ¾-oz. distance bait-casting event was won by Clem Forcade with a long cast of 349 ft. and an average of 336¾ ft.; in the ⅝-oz. distance bait-casting event, Ernest Liotta established a new world's record with a long cast of 449 ft. and an average of 432½ ft.

The ninth International Tuna Cup match was held at Wedgeport, N.S., Sept. 10-12, 1952, and the Alton B. Sharp trophy was won by the Cuban team. The U.S. team was second and the British team third. The quality of the fishing in Soldier's Rip, traditional grounds of the match, was poor, so the fleet was moved to the mouth of the Tusket river. This area is protected from heavy seas.

The International Game Fish association's outstanding world's record catch for the year was a 1,135-lb. black marlin, the largest billfish in the history of big-game angling, which was taken by S. Kip Farrington on Sept. 28, 1952, in the waters off Talara, Peru. Other record fish listed during the year numbered seven (most of these were caught in previous years). A 279-lb. alligator gar was caught on Dec. 2, 1951, in the Rio

Grande river, Texas, by G. Valverde. A black bullhead weighing 8 lb. was taken at Lake Waccabuc, New York, on Aug. 1, 1951, by Kani Evans. A 94½-lb. blue catfish was caught on May 22, 1949, in the James river, South Dakota, by Roy A. Groves. An 11½-lb. arctic charr was caught in Richmond Gulf, Hudson bay, on Aug. 10, 1950, by John Durant. A 4-lb. 12-oz. white perch was caught in Messalonskee lake, Maine, on June 4, 1949, by Mrs. Earl Small. A 23-lb. 6½-oz. pollack was caught on May 29, 1952, by A. L. Hansen at Chatham, Mass. A 66-lb. roosterfish was caught on Aug. 14, 1949, by W. R. Good, at Bahia de Los Angeles, Mex.

(A. J. ME.)

Anglo-Egyptian Sudan. A territory in northeast Africa, the Anglo-Egyptian Sudan is under the joint sovereignty of Great Britain and Egypt. Area: 967,500 sq.mi. Pop. (no census ever taken, 1951 est.): 8,740,000. Languages: English, Arabic and various Nilotic and Negro tribal dialects in the south. Religion: Arabic minority is Moslem, the Negro population mainly heathen; only c. 20% of the population in the south is Christian. Chief towns (pop., 1948 est.): Khartoum (cap., 71,400); Omdurman (125,300); El Obeid (70,100); Wad Medani (57,300); Port Sudan (47,000). Governor-general: Sir Robert Howe.

History.—The affairs of the Sudan during 1952 were once more intimately bound up with the development of Anglo-Egyptian relations. When these became critical at the time of the unilateral denunciation by Egypt of the 1936 Anglo-Egyptian treaty and of the 1899 condominium arrangements for the Sudan, on Oct. 27, 1951, it was stated as one ground for this action that Great Britain had "persistently tried to separate the Sudan from Egypt." This provoked from the British foreign office a reaffirmation of the "two fundamental principles" of their policy namely, "that they will agree to no change in the status of the Sudan without consultation with the Sudanese, and that they will maintain the right of the Sudanese freely to choose their own status."

On Jan. 17, 1952, a draft constitution, prepared by the

ARABS EXCITEDLY reporting the theft of their camels to a district commissioner in the Anglo-Egyptian Sudan

Sudanese Constitutional commission, was submitted to the legislative assembly. It proposed a bicameral parliament consisting of a chamber of deputies of 100 members with power to elect the prime minister and of a senate having 30 elected and 20 nominated members. Other than the prime minister, the council of ministers was to consist of Sudanese, eligible for, but not necessarily members of, parliament, and chosen by the governor general in consultation with the prime minister. External affairs and defense matters were to some extent reserved to the governor general who might, in an emergency, preside over the council of ministers. Differences within the Sudan were reflected in the provision for a minister of southern affairs, who was himself to be a southerner. It was made clear that this was to be no more than a temporary constitution, designed to function until the Sudanese had decided upon their future. For this purpose it was suggested that a constituent assembly should be set up before the end of 1953. This, on the advice of a resident international commission, should supervise the achievement of full self-determination.

Meanwhile the two major groups of parties or fronts (Umma, or Nation, standing for independence, and Ashigga, aspiring to the Nile valley unity) had agreed on Jan. 3 to ask for a plebiscite on the future of the country. The increasing tempo of political life was reflected in the appearance of new parties, one the Sudan Republican party, favouring the creation of a secular Sudanese republic within the Commonwealth of Nations, in accordance with the example set by India, and another a Socialist party.

The reopening of Anglo-Egyptian negotiations in April provoked a message from Miralai Abdullah Khalil, the leader of the legislative assembly and also secretary-general of the Umma party, expressing confidence in British intentions and attacking Egypt's "deplorable attitude" and "attempts to impose her crown on us." However, a strong Umma delegation accepted an invitation to visit Egypt in May.

On April 23 the legislative assembly approved the draft constitution with some modifications. Substantial powers remained with the governor general, but his right to overrule decisions of parliament was specifically limited. The senate was to be in accordance with the recommendations of the Constitutional commission but the chamber was reduced in size to 78 members. Of these 24 representing the more politically advanced areas were to be elected by manhood suffrage and secret ballot, and 54 were to be chosen by manhood suffrage exercised through tribal electoral colleges. The assembly provided for the exercise by the Sudanese of their right of self-determination at such a time and in such a manner as they themselves should determine.

After Gen. Mohammed Naguib (himself of Sudanese birth) had attained power, the Egyptian government began a re-examination of its policy toward the Sudan. (See also EGYPT.)

Antarctica. The antarctic continent lies almost entirely within and is circumscribed by the Antarctic circle. With an area of nearly 6,000,000 sq.mi., equal to the United States and Europe combined, nine-tenths of it is covered by an ice sheet, thousands of feet thick in places. The 2,000,000

sq.mi. area thus far seen by man has an estimated elevation of about 5,000 ft., with the south pole at a height of slightly less than 10,000 ft. The 14,000-mi. coast is largely inaccessible to ship navigation because of sea ice barricading the coastal shores.

History.—During the 1952 season, the Argentines increased their activities in their claimed sector of Antarctica by establishing an additional base on the northeastern tip of Palmer peninsula. The base, which was set up in the latter part of March, was named *Esperanza* (hope). In early February, when the British survey ship "John Biscoe" landed at Hope bay, the Argentines who were already there fired shots over the heads of the British landing party which was seeking to re-establish a base evacuated in 1949. The Argentine group prevented the landing by ordering the British not to disembark. The British in turn ordered their frigate "Burghead Bay" from the Falkland Islands. The Argentines later admitted that they had "acted in error," and the British finally landed stores and building materials without further interference. To substantiate their nations' claims, the British maintained five bases on the continent, the Argentines six and the Chileans three.

In early February the Norwegian sealer "Norsel" evacuated the personnel from the combined Norwegian-Swedish-British expedition which had conducted scientific research and geographical exploration in the Norwegian-claimed sector of Antarctica. From their wintering base Maudheim, seismological soundings were completed southward for a distance of 300 mi., and the thickness of the ice cap was determined to vary from 900 to 7,450 ft. Several hundred hitherto unknown square miles of land were mapped with the expedition's aircraft, and 500 mi. of coast line exactly delineated. Captain John Giaever of Norway was in command of the base since it was first set up in Jan. 1950. The scientific expedition was under the over-all direction of a Swedish glaciologist, Hans Wilson Ahlmann, and a Norwegian oceanographer, Harald U. Sverdrup.

In Jan. 1950 the French expedition, commanded by Paul-Émile Victor, established the Port Martin base in the French-claimed sector of Adélie Land to the south of Australia. In Jan. 1952 a relief party of 16 men arrived at the base on board the Norwegian chartered ship "Tottan." The day the ship was to sail north with the outgoing party, the main bunkhouse at the base was destroyed by fire. This necessitated abandonment of the station, and seven men were left at an auxiliary base which had been set up earlier about 70 mi. west of Port Martin. This base was located in close proximity to a rookery of about 4,000 penguins of the emperor type discovered by Andre Liotard. The men were to make an intensive study of penguin life over a period of one year.

The Australian government continued to maintain weather observing stations on Heard, Macquarie and Kerguelen Islands to the south of Australia. Plans were being made by P. G. Law, head of the Australian antarctic expeditions, for the establishment of technical research stations on the Australian-claimed sector of the antarctic continent. The snow-covered, icebound land had never been fully explored geographically nor geologically, and many Australian scientists believed it might contain vast mineral resources.

(F. RE.)

Anthropology. The year 1952 was one of marked activity and accomplishment in all branches of anthropology. Universities broadened the scope of their training programs, and research and publication proceeded at an accelerated rate, stimulated in part by increased support from foundations and other sources. Coincident with the wider recognition and acceptance of the important role of anthropology in human affairs was a healthy tendency on the part of anthropologists

to re-examine and define more sharply their objectives and to improve and refine their methods and techniques. As examples might be mentioned two papers analyzing and interpreting some of the social and psychological factors involved in culture change: "Experimental Design in the Study of Cultural Change," by George Spindler and Walter Goldschmidt, and "Some Dynamic Forces in Tlingit Society," by Frederica de Laguna, both published in the *Southwestern Journal of Anthropology*, and another group of papers in the *American Anthropologist* on "The Training of the Professional Anthropologist," by Theodore McCown, W. D. Strong, C. F. Voegelin and Z. S. Harris, W. N. Fenton, Eliot Chapple and Margaret Mead. With a Ford foundation grant, Cornell university, Ithaca, N.Y., established a field methods training program, under the direction of S. A. Richardson, to provide training in new techniques of interviewing and observation in the social science disciplines. At Stanford university, Stanford, Calif., the foundation also supported a new program, directed by Felix M. Keesing, which aimed at a broader, interdisciplinary approach to the problems of social change and the economic advancement of underdeveloped areas.

As part of a broad program for the assessment and better utilization of the human resources of the United States, the American Anthropological association joined the American Council of Learned Societies in circularizing its members to obtain precise information on their academic and professional background, research activities and specialized knowledge.

A number of international anthropological conferences and symposia were held during the year. The 30th International Congress of Americanists convened at Cambridge, Eng., in August, followed by the 4th International Congress of Anthropological and Ethnological Sciences, in Vienna, Aus., and the 2nd Pan-African Congress on Prehistory in Algiers in September. The Wenner-Gren foundation International Symposium on Anthropology, organized by A. L. Kroeber and a planning group of seven anthropologists, was held June 9-20 at the foundation's headquarters in New York city. The theme of the symposium was "A World Survey of the Status of Anthropology," and 80 anthropologists and other scientists from the United States and 18 other countries participated. The symposium was based on 50 background papers, each reviewing the present status of knowledge in a particular field and the problems arising therefrom. Cultural interchange between east and west, particularly between China and western Europe, was the subject of a symposium of the British Society for the History of Science held in London.

The Guggenheim Memorial foundation awarded 22 fellowships for work in anthropology and related fields. The Wenner-Gren foundation awarded 33 grants-in-aid and fellowships and initiated a project for preparation of a "Handbook of World Resources for Research and Education in Anthropology," to contain summary descriptions of the organization and operations of all institutions with interest in anthropology. Erminie W. Voegelin began preparation of the section on U.S. resources.

The Bureau of Ethnic Research, an information and research centre for the study of modern Indian groups in the southwestern United States, was established at the University of Arizona, Tucson, under the supervision of Emil W. Haury and William H. Kelly. Cornell university set up a social science laboratory at the Vicos hacienda in northern Peru with Allan R. Holmberg as director. The laboratory would study the effects of new health measures, agricultural methods, education and industrialization on the Indian inhabitants. A grant from the Carnegie Corporation of New York enabled Northwestern university, Evanston, Ill., to broaden its African area program by creation of a new African study centre, with Melville J. Herskovits as director. With the support of the Nuffield foundation of Great Britain the

INDIAN SKELETONS discovered on Santa Rosa Island, Calif., in 1952, by Philip C. Orr, anthropologist at the Santa Barbara Museum of Natural History. They were believed to be remains of an Indian culture more than 8,000 years old, whose members were stronger and taller than Indians whom the Spaniards met on reaching California

Royal Anthropological institute established the Nuffield Blood Group centre, with headquarters in London. The new organization would accumulate and analyze data on human blood groups, make its results available to research workers and carry out or stimulate field work. A series of radio broadcasts on the "Ways of Mankind" was begun at the University of California at Los Angeles, under the direction of Walter Goldschmidt. The program, sponsored by the National Association of Educational Broadcasters with a grant from the Ford foundation, would attempt to dramatize the basic concepts of anthropology and sociology for school audiences and the public.

Viking fund medals were awarded to Ralph Linton, general anthropology, Carleton Coon, physical anthropology, and Frank H. H. Roberts, archaeology. Kaj Birket-Smith was named Huxley memorial lecturer for 1952, and Rivers memorial medals were awarded to L. S. B. Leakey and Monica Wilson. Brewton Berry received the Ainsfield-Wolf award for his book *Race Relations*.

William S. Laughlin resumed his ethnological and physical anthropological work in the Aleutian Islands, and G. C. Lucier made a study of the nonmaterial culture of the Noatak Eskimos of northern Alaska, both projects supported by the Arctic Institute of North America. Frederica de Laguna and Catherine McClellan conducted ethnological work among the Tlingit of Yakutat bay, and Edmund S. Carpenter made a study of space and time concepts of the Aivilik Eskimos on Southampton Island, north of Hudson bay. Field research in South America by the University of California, Berkeley, included ethnological studies in Brazil by William D. Hohenthal, in Bolivia by John F. Goins and in Venezuela by H. T. McCorkle, Jr. Stig Rydén made a third expedition to the Tiawanaco area of Bolivia for the ethnographical department of the Gothenburg museum, Göteborg, Swed., and Kaj Birket-Smith of the National museum, Copenhagen, Den., conducted ethnological work on Rennell Island.

Ethnological studies of the Plateau tribes were made by Norman Lerner, Al and Letitia Mohr and Thomas Garth for the University of Washington, Seattle.

The second and third volumes of *Proceedings of the 29th International Congress of Americanists*, edited by Sol Tax and including selected papers on "Acculturation in the Americas" and "Indian Tribes of Aboriginal America," were published by The University of Chicago. The status of anthropological research in Alaska was discussed by Viola Garfield, Margaret Lantis, Frederica de Laguna, W. S. Laughlin and J. L. Giddings, Jr., in *Science in Alaska*, a volume of selected papers of the first Alaskan Science conference, edited by H. B. Collins and published by the Arctic Institute of North America. The sixth edition of the Royal Anthropological Institute's classic manual, *Notes and Queries on Anthropology*, appeared in a new format and with completely revised contents covering physical and social anthropology, material culture and field antiquities. Karl Gustav Izikowitz' *Lamet, Hill Peasants of French Indo-China*, an integrated study of a little-known tribe in northern Laos, was published by the Gothenburg museum.

The methodology and scope of social anthropology were discussed by Raymond Firth in *Elements of Social Organization*, a volume that focused attention on the situation of primitive societies and peasant communities in the industrialized world of today. An interpretation of the archaeological data relating to primitive economy was presented by J. G. D. Clark in *Prehistoric Europe: the Economic Basis*. The most substantial contribution in the field of primitive economics was M. J. Herskovits' *Economic Anthropology*, an enlargement and revision of the author's standard reference work, *The Economic Life of Primitive Peoples*. Philip Mayer's "Two Studies in Applied Anthropology in Kenya" reported on field investigations on the economic life of the Gusii tribe.

The status of constitutional research and its relation to anthropology as a whole was discussed in an article by Edward E. Hunt, Jr., "Human Constitution: An Appraisal," published in the *American Journal of Physical Anthropology*. Another article in this journal by W. W. Howells, "A Factorial Study of Constitutional Type," described an independent, statistical approach—the factorial method—for critical evaluation of the Sheldon system of somatotyping. One of the most significant contributions of recent years to the problem of Neanderthal man was F. Clark Howell's article, "The Place of Neanderthal Man in Human Evolution," published in the same journal. Howell emphasized the differences in morphology and age between the classic Neanderthals of the early fourth Glacial and the earlier forms (Ehringsdorf, Galilee, Saccopastore, Mount Carmel) of the third Interglacial, which made it necessary to differentiate between the two groups when considering their role in human phylogeny. The earlier Neanderthals resembled modern man in a number of physical characters, and the Mount Carmel population of Palestine is regarded as directly ancestral to modern man. The later, classic Neanderthals, descended from Ehringsdorf and Saccopastore types, represent a peripheral, isolated group that developed in western Europe at the beginning of the fourth Glacial period and became extinct either prior to or after the arrival of modern man who in the meantime had been developing farther to the east.

The last work of Robert Broom, *Swartkrans Ape-Man: Paranthropus Crassidens*, by J. T. Robinson as joint author, was published by the Transvaal museum, Pretoria, U. of S. Af. Other important publications of the year were *Human Locomotion and Body Form*, by Dudley J. Morton; *The Comanches; Lords of the South Plains*, by Ernest Wallace and E. Adamson Hoebel; *Symposium on Local Diversity in Iroquois Culture*, edited by William N. Fenton; *The Four Ages of Tsurai; a Documentary History of the Indian Village on Trinidad Bay*, by Robert F.

Heizer and John E. Mills; *Ainu Folklore*, by Carl Etter; *Bibliography of African Anthropology, 1937-49*, by W. D. Hambly. (See also ARCHAEOLOGY.) (H. B. Cs.)

Aqueducts. The golden jubilee year of federal reclamation in the United States was signalized in 1952 by the integrated operation of the aqueducts, power plants and other facilities on some of the largest multiple-purpose water conservation projects in the world.

Established under the Reclamation act approved by Pres. Theodore Roosevelt on June 17, 1902, the national water resource program on its 50th anniversary embraced 69 projects which in 1951 (latest crop year) furnished a full or supplemental supply of irrigation water for 125,000 farms, consisting of 6,713,000 ac. in the 17 western states.

Facilities on these projects included more than 18,000 mi. of canals and laterals, 5,500 mi. of drains, 108 storage and 71 diversion dams, 331 major pumping plants and 10,550 mi. of operating roads.

Farmers on reclamation projects raised crops with a new all-time, all-high gross value of \$821,722,000, the sixth consecutive year that crop values exceeded the \$500,000,000 mark. The cumulative value of reclamation crops produced since 1906 was \$7,983,529,000, approximately seven times the total investment in all irrigation features on all reclamation projects.

The year 1952 was highlighted by the placing in service of three outstanding irrigation pumping plants—the Grand Coulee pumping plant on the Columbia Basin project in Washington, the Tracy pumping plant on the Central Valley project in California, and the pumping plant on the Colorado-Big Thompson project.

When in full operation, each of the 12 giant pumps in the Grand Coulee plant would lift more than 1,000,000,000 gal. of water daily 280 ft. out of the Columbia river to irrigate more than 1,000,000 ac. of land in eastern Washington.

Aqueduct features on the Columbia Basin project include the Feeder canal whose 16,000 cu.ft. per second capacity is almost enough to carry the average flow of the Colorado river. Six major canals on the project have a combined length of 300 mi.

Integrated operation of man's longest and largest mass transfer of water was initiated in the Central valley of California. Under this program, Sacramento river water stored behind Shasta dam is delivered 500 mi. to dry lands in the San Joaquin river valley. At Tracy, Calif., giant pumps lift the water 200 ft. The project includes the 153-mi. Friant-Kern canal and the 120-mi. Delta-Mendota canal. The former delivers San Joaquin river water from Millerton lake behind Friant dam to areas as far south as Bakersfield, Calif. The latter transfers Sacramento river water from the San Francisco bay area southward 120 mi., discharging it into the Mendota pool in the San Joaquin basin, thereby providing irrigation water to replace that diverted by the Friant-Kern canal.

Three pumps with a combined capacity of nearly 500,000 gal. of water per minute were set in motion during the year at the Granby, Colo., pumping plant, high on the west slope of the Rockies, to supply irrigation water through the Colorado-Big Thompson project, for 700,000 ac. of land on the east slope. This project is famous for its 13-mi. Alva B. Adams tunnel,

the longest irrigation tunnel in the world, carrying the water through the continental divide.

Also included among the major aqueduct systems in the federal reclamation program was the All-American canal in California.

This waterway is 232 ft. in width at the water surface, 160 ft. wide at the bottom and 20.6 ft. in depth with an initial capacity of 15,155 cu.ft. of water per second. The project includes the 125-mi. Coachella canal which branches from the 80-mi. All-American main canal near the Mexican border about 20 mi. west of Yuma, Ariz., and terminates near Indio, Calif.

(See also CANALS AND INLAND WATERWAYS; DAMS; IRRIGATION; TUNNELS.)
(M. W. Ss.)

Arabia. Arabia is a peninsula of southwestern Asia of approximately 1,027,300 sq.mi., with a total population estimated at 9,277,000. It consists politically of two independent Arab states, Saudi Arabia (*q.v.*) and Yemen (*q.v.*); the protected sultanates of Oman and Muscat; the autonomous sheikhdoms of Bahrein, Kuwait, Qatar and the Trucial sheikhdoms; and Aden colony and protectorate (*q.v.*). Language: Arabic. Religion: Moslem (Sunni).

Bahrein.—Area: 213 sq.mi. Pop. (1951 est.): 110,000. Capital, Manamah. Ruler: Sheikh Sir Sulman ibn Hamad al Khalifah. British political resident for the Persian gulf area in 1952, Sir Rupert Hay; political agent for Bahrein, W. S. Laver.

Kuwait.—Area: c. 9,000 sq.mi. Pop. (1951 est.): 170,000. Ruler, Sheikh Abdullah bin Salim al-Subah. British political agent in 1952, C. J. Pelly.

Oman and Muscat.—Area: c. 65,000 sq.mi. Pop. (1951 est.): 550,000. Capital, Muscat. Ruler, Sultan Said bin Taimur. British consul in 1952, Maj. F. C. L. Chauncy.

Qatar.—Area: c. 4,000 sq.mi. Pop. (1951 est.): 17,000. Ruler, Sheikh Ali bin Abdullah al-Thani.

Trucial Sheikhdoms.—Area: c. 16,000 sq.mi. (including the sheikhdoms of Sharjah, Ras al Khaimah, Umm al Qawain, Ajman, Dubai, Abu Dhabi and Kalba). Pop. (1951 est.): 80,000.

History.—The loss of Anglo-Iranian oil supplies, which had ceased in June 1951, had been more than made up by increased production from other neighbouring oilfields, including Kuwait where by the end of 1951 output was raised by 58%, and Qatar where the increase was 47%.

In the first half of 1952 this increased production was maintained from both fields.

In June, after an exchange of diplomatic notes, the British government rejected the Iranian claim that the Bahrein islands were an integral part of Iran. It maintained its contention that Bahrein was a state under British protection and that it would not recognize the Iranian claim to it or to any other territory belonging to any state under British protection in the Persian gulf.

In January a new well was discovered in Kuwait about seven miles from the main oilfield at Burgan. Early in the year the sheikh of Kuwait approved a development scheme for his capital. It foreshadowed the rebuilding of most of the city over a period of 15 years.

Early in the year the British protected trucial sheikhs made repeated representations regarding the delay in the development of their reputed oil resources.
(O. M. T.)

Economy.—Crude oil production in Bahrein, Kuwait and Qatar was as follows: *Bahrein* (1950) 1,500,000 metric tons, (1951) 1,509,000 metric tons, (1952, six months) 750,000 tons; *Kuwait* (1950) 17,018,000 tons, (1951) 28,327,000 metric tons, (1952, six months) 18,700,000 metric tons; *Qatar* (1950) 1,600,000 metric tons, (1951) 2,348,000 metric tons, (1952, six months) 1,534,000 metric tons.

SEGMENT of the colossal statue of a goddess found in the Temple of Poseidon near Corinth, Gr., in 1952, by archaeologists of The University of Chicago

Archaeology. Eastern Hemisphere.—Part of the archaeological news of the year 1952 pertained to actual excavations; a fair part also pertained to new understandings gained through the publication of reports on excavations done some time before but hitherto undocumented. With the appearance of Alfred Rust's *Die Höhlenfunde von Jabrud* (a Syrian cave), R. Neuville's *Le Paléolithique et le Mésolithique du Désert de Judée* (materials from Palestinian caves), and G. Caton-Thompson's *Kharga Oasis in Prehistory*, it became clearer that the near and middle east was an area of major importance during Pleistocene prehistoric times. The full delineation of the middle Pleistocene prehistory of east central Africa also became available with the appearance of L. S. B. Leakey's *Olduvai Gorge*. Important additions to the literature of the later ranges of archaeology also appeared.

A very heartening aspect of the 1952 field year was the return to their old excavations of so many of the various national professional schools of archaeology. The Louvre was again at work in Syria, the Germans in Turkey, the British at Jericho in Jordan, and the Italians at Phaistos in Grecian Crete. Thus the old familiar international character of field research continued to reassert itself.

Pleistocene Prehistory.—The most spectacular news was of finds from the continuing excavation of the rock shelter near Angles-sur-l'Anglin, Vienne, Fr. There, in a Magdalenian context, Dorothy Garrod and Suzanne de Saint-Mathurin extended their clearance of the magnificent frieze of life-sized relief sculptures of ibexes, horses and human figures. This art was dated at about 12,000 years ago.

A. C. Blanc described the finding of semifossilized human footprints in a deep cave near the village of Toirano, Liguria, It. The prints, which were rather short but broad and with a vigorous little toe, were found in association with footprints and bones of the cave bear. This extinct animal is usually found in context with Neanderthal man in Italy, and Blanc suspected that the prints might be those of Neanderthals.

The Near-Middle East.—In Egypt, Zakaria Goneim discovered and began clearance of a great 3rd dynasty pyramid terrace,

MAIN CEMETERY of ancient Eleusis, Gr., where extensive excavations were conducted by G. E. Mylonas of Washington university, St. Louis, in 1952. The graves, built over each other and next to each other, dated roughly from 1800 B.C. to 25 B.C.

with a carefully laid limestone enclosure wall and the remains of a step pyramid. The complex resembled that of the step pyramid and enclosure attributed to Zoser, but was structurally more advanced; it was never completed, and its attribution to a particular pharaoh was not yet certain. The Oriental institute's Luxor expedition concentrated on the triumphal relief of She-shonk I, on the Bubastite gate.

Several expeditions worked with considerable success in Iraq. The Iraqi Directorate-General of Antiquities continued its restoration of the great Parthian desert fortress of Hatra. At Nippur, D. E. McCown's joint University museum (University of Pennsylvania, Philadelphia)-Oriental institute (The University of Chicago, Ill.) expedition recovered a very large cache of Sumerian literary texts and some interesting architectural details in the scribal quarter. In other areas an imposing temple of the goddess Inanna was provisionally traced and an earlier (first half of the third millennium B.C.) temple was discovered. A group of Sumerian statues was recovered, and the season's finds made a great contribution to the understanding of Nippur's character as a great religious and literary centre of ancient Sumeria and Babylonia.

Northward in ancient Assyria, M. E. L. Mallowan's British School of Archaeology in Iraq (Baghdad)-Metropolitan Museum of Art (New York city) excavations at Nimrud—the capital in which Assur-nasir-pal II accumulated the great treasures his armies had won—recovered a fine collection of large ivory carvings, a variety of small objects, commercial and historical texts and fragments of a series of monumental reliefs. One of the ivories showed a lioness killing a Nubian in a field of lotus blossoms and was inlaid with gold, lapis lazuli and carnelian.

Another important pre-World War II expedition—that of the Louvre museum (Paris) under André Parrot at Mari on the

Syrian Euphrates—resumed its work. The core of an Early Dynastic ziggurat was tested, and more of the familiar Mari carved bone figures and sculpture were recovered.

In Jordan, Kathleen Kenyon's joint British and American schools expedition recommenced work at the site of biblical Jericho. Miss Kenyon's preliminary note in *Antiquity* added much needed clarity to the understanding of the "neolithic" settlement, which is known to have been of considerable size and apparently fortified. An architectural distinction is possible between the prepottery and the pottery bearing layers. An international expedition of the various schools in Jerusalem searched about 40 caves in the Dead sea area for further documents of the "Dead Sea scroll" type. A pair of inscribed bronze scrolls was recovered, which it was believed might contain Old Testament documents, but their unrolling would be difficult as the metal had crystallized. The American school continued its work at the Moabite site, Dhiban; the French proceeded at Tell al-Farah.

The Israel Department of Antiquities, under S. Yeivin's direction, undertook a number of excavations. The cave of Kabbara was reopened for its prehistoric materials, the deeper levels in the southeastern part of the site of Khirbet Kerak were tested to virgin soil with an "Early Bronze I" yield, even earlier materials were examined at Afula, and a Hyksos cemetery was excavated near Naan. At Caesarea the accidental discovery of a statue led to extensive excavations in the Graeco-Roman period.

The new *Israel Exploration Journal* was appearing, with articles in western European languages and a fine quality of illustration.

In Turkey, the government Antiquities service was relatively inactive. The British Institute of Archaeology at Ankara resumed work at Sultan Tepe (probably ancient Harran) and more clay tablets were recovered; the school's new journal, *Anatolian Studies*, appeared in a very interesting first issue. The

long-range German program of work at Bogazkoy, the Hittite capital, recommenced under Kurt Bittel, Hans Guterböck and R. Naumann.

Clearance in the acropolis and in storerooms of the largest temple was being undertaken, and a rich cremation cemetery was under excavation.

In Iran only the work of the French under R. Ghirshman at Susa was proceeding, in later historic levels. Froelich Rainey, director of the University museum, carried on an archaeological reconnaissance in Afghanistan.

Classical Lands.—There was considerable activity on Cyprus. At the University museum's site of Kourion, S. Weinberg continued architectural clearance of the earlier "Late Bronze Age" levels, and G. H. McFadden proceeded with the excavation of the sanctuary of Apollo. At Paphos the British under T. B. Mitford began work on the mound of the old town and recovered Cypriote, Mycenaean, Geometric and Archaic Greek materials. Joan Taylor of the London institute excavated a "Late Bronze Age" sanctuary at Pigadhes. Claude Schaeffer published the spectacular metal and faience finds of the 1949 French season at Enkomi.

On Crete the Italian school under Doro Levi resumed its work at the palace of Phaistos. The earlier levels of the installation were tested, rich finds of the handsome "Kamares" pottery were made, and there was a suggestion—through lack of pottery of the early Minoan type in a contact zone—that some compression might be necessary in the Cretan chronology. At Knossos the British school under Piet de Jong and Sinclair Hood undertook the clearance of four late Minoan tombs which appeared during construction work for a new hospital. Pottery, seals, a sword and a fine early Greek helmet were recovered.

The 16th season of excavations of the American School of Classical Studies in the Athenian agora was devoted to the clearing up of the market place, during which the foundations of a 1st-century temple of Ares appeared. Fragments of a 5th-century B.C. altar of Ares and of a 4th-century figure of muse type were found, and walls of various periods were traced. Some earlier Mycenaean and Protogeometric graves were cleared. Both the American school and Oscar Broneer of The University of Chicago were at work in the Corinth district. The German school had reopened its Athens headquarters. Work on the restoration of the Greek museums was seriously curtailed by the cessation of Marshall Plan funds.

In Italy Amedeo Maiuri, long-time director of the Scavi di Pompeii e di Ercolano, Naples, had laid plans for uncovering the two-fifths of Pompeii which still lies under ash. The excavation of houses in the southeastern quarter, near the Palestra and the amphitheatre, had begun. A magnificent series of Roman mosaics was being uncovered in a large villa near Piazza Armerina in Sicily. G. V. Gentili believed the villa to date to the 3rd century and to have been inhabited for several centuries; because of the lack of Christian symbols in the mosaics, Gentili believed the villa must have remained in the hands of a line of patricians of pagan persuasion.

Italian excavations under L. B. Brea on the Aeolian islands of Panaria and Lipari yielded an interesting series of antiquities from "neolithic" to Greek times, with suggestions of early contact from Crete and possibly western Asia. J. B. Ward-Perkins, of the British school in Rome, continued excavations on the site of Sabratha in Tripolitania, a city once inhabited by Phoenicians, Romans and Byzantines.

Europe.—Little news was available from eastern Europe; the Czechoslovakian *Archeologické Rozhledy* contained brief notes on various post-Pleistocene finds in Czechoslovakia and Poland. From Yugoslavia D. Garasanin reported in *Arkeoloski Vestnik*, 1952, on a very fine stylized human head of baked clay, found

near the town of Pristina; the head was assigned to the later Vinca phase. In Britain J. G. D. Clark completed his work at Star Carr on the important "mesolithic" bog site. Various municipal and college training program excavations were reported from England and Scotland: the fortifications of Norwich, the Roman wall at Dorset, Saxon huts and Roman buildings at Canterbury, a "neolithic" site in the East Anglian fenlands, and a pair of Yorkshire barrows were among the things tested. At Jarlshof on the Shetland Islands, J. R. C. Hamilton cleared the foundations of the broch tower and its surrounding stone huts of the Pictish village of c. 2,000 years ago.

India.—The Deccan research group under H. D. Sankalia established a five-part relative chronological scheme for their area by excavations in sites running from Pleistocene down to Moslem times.

(R. J. B.)

Western Hemisphere.—The annual meeting of the Society for American Archaeology was held at Columbus, O., May 1-3, 1952, and the principal topic of discussion was the techniques and results obtained by the radiocarbon dating method developed by W. F. Libby and his co-workers at Chicago, Ill. Among other problems discussed was that of contamination of samples by radioactive dust created by the atomic bomb tests since 1945. Since the recent tests in Nevada this had become particularly serious and fieldworkers were advised to place samples in air-tight containers as soon as they were collected. The Institute of Nuclear Studies at The University of Chicago was engaged in the development of a scintillation counter to replace the grid counter which was being used. This not only promised to extend the range of dating, but might also shorten the time necessary to make the determinations and increase accuracy. In addition to the laboratories at The University of Chicago, Columbia university and the University of Michigan which were operating and producing dates of archaeological and geological samples,

PICTISH VILLAGE of Jarlshof as excavated in the Shetland Islands, Scot., an Iron Age settlement contemporary with Roman rule in southern Britain. Excavations, undertaken by the ministry of works, were in their final phases in 1952. Foreground shows the courtyard of the broch (circular stone tower enclosing apartments) and wheelhouses

other laboratories were being set up at Yale university and at the universities of Pennsylvania, California, Texas and Colorado. Several other institutions were considering such installations.

Early Man.—The remains of a mammoth skeleton were excavated near the village of Santa Isabel Ixtapan in the dry bed of Lake Texcoco, 18 mi. N.E. of Mexico City and about 1 mi. from the locality where the Tepexpan skeleton was discovered. Luis Aveyra and Manuel Malonado Koerdell of the Dirección de Prehistoria, Instituto Nacional de Antropología e Historia, who were in charge of this work, discovered flint artifacts in association with the bones. Three United States specialists, as well as a number of Mexican archaeologists, were invited to observe the continuation of the work. Six artifacts were discovered in close association with the partially disarticulated elephant and one of these was a projectile point very similar to the Scottsbluff type. This clear-cut evidence of man in late Wisconsin glacial times was buried in the lake deposits of the Becerra formation.

Another mammoth with artifacts associated was discovered in southern Arizona, just north of the Mexican border, by Fred Navarrete of Naco, Ariz. This was reported to the Arizona State museum at the University of Arizona, Tucson, and a party headed by Emil Haury of the university continued the excavation. A total of eight projectile points of the Clovis Fluted type were found in direct association with the skeleton; five of them were discovered in place by the museum party. Ernst Antevs, a Pleistocene geologist who was present at the excavation, estimated a minimum age of 10,000 years.

Work was continued on an early man site at Lind Coulee in the eastern part of the state of Washington. This excavation, under the direction of Richard D. Daugherty of the State College of Washington, Pullman, had produced more than 100 artifacts.

Arctic.—In Eskimo archaeology, particular interest had centred on the problem of the Dorset culture. The first information about Dorset dwellings came from excavations made by Deric O'Bryan at Mill Island. Bernard G. Hoffman published a short but highly significant paper (*American Antiquity*, vol. 18, no. 1) which utilized the recently available dating of late Pleistocene events and of the Dorset-related early cultures of the northeastern United States to examine the possibility of whether these cultures could have derived their traits from Dorset. He suggested that such early cultures as the Old Copper culture of Wisconsin and the Lamoka, Frontenac and Laurentian cultures of New York state may be in part ancestral to Dorset rather than the reverse.

A party from Peabody museum, Harvard university, Cambridge, Mass., headed by Wilbert Carter, continued excavations begun in 1951 in prehistoric sites in the vicinity of Point Barrow, Alsk. This work was supported by the office of naval research and based at the Point Barrow Arctic Research laboratory.

James van Stone of the University of Alaska, College, made an archaeological survey of sites on Nunivak Island, and J. L. Giddings, Jr., of the same institution examined some limestone caves in the headwaters region of the Firth river in northeastern Alaska and made collections of dendrochronological specimens in the same area.

W. S. Laughlin headed a party from the University of Alaska which continued the program of research in the Aleutian Islands. Work was concentrated in the eastern islands and particular attention was paid to the dating of an early lamellar flake industry. On the basis of radiocarbon dates, Laughlin estimated that prehistory of the islands had been traced back for about 4,000 years.

Pacific Coast.—Charles E. Borden, University of British Columbia, Vancouver, continued excavations at the deep site which

he discovered in the Musqueam reserve in 1951. A number of artifacts were recovered and material from the lower levels was markedly different from the protohistoric Musqueam remains in the upper levels. The same investigator salvaged the finds from a site in Vancouver city. These consisted mostly of stone bowls and perforated stones.

The University of Washington, Seattle, had several parties in the field. Carroll A. Burroughs conducted the summer field session at a shell midden site on San Juan Island. Douglas Osborne assisted by several students made a survey of the Okanogan region, investigated several caves in central Washington, and continued excavations in the McNary reservoir on the Columbia river near Pasco, Wash.

The annual Northwestern Archaeological conference was held at the University of Washington, May 2-3, 1952. It was attended by about 150 people.

In California, A. E. Treganza excavated two sites in Calaveras county, a continuation of the salvage work in Farmington reservoir under the University of California Archaeological survey. These were both late prehistoric sites and one continued to be inhabited until about 1870.

A class in field methods was directed by William J. Wallace at a shell mound site located on Little Sycamore creek in Ventura county. A limited range of artifacts was found, including pitted hammerstones, manos, metates and a few large projectile points. Five flexed burials were found. A well-developed calcareous layer, incrustation on the artifacts, as well as the types of objects found, suggested that the occupation was rather old.

Southwest.—The Anthropology section of the Southwestern Division of the American Association for the Advancement of Science met at Boulder, Colo., on May 2. The greater part of the meeting was devoted to a symposium on Colorado prehistory. The annual Pecos conference was held at Santa Fe, N.M., Aug. 11-13.

The University of Colorado field school, directed by Robert Lister and Herbert Dick, co-operated with the Denver Museum of Natural History party headed by Marie Wormington, continuing the excavation of caves near Grand Junction, Colo., which was begun the previous year. Additional evidence was accumulated on the preceramic and preagricultural occupation of the area.

The University of New Mexico field school was held in two sections. One, under the direction of Florence Hawley Ellis, excavated at the Pojoaque, near Santa Fe. This pueblo was abandoned about 50 years earlier. The other section, under Paul Reiter, completed the excavation of a cave in Lincoln county.

The field school of the University of Arizona was again located at Point of Pines. Under the direction of Emil Haury, the students excavated a Tularosa Phase site and tested in several villages dating between 700 and 1000 A.D.

T. L. Smiley published an important paper on southwestern dendrochronology ("A Summary of Tree-Ring Dates from Some Southwestern Sites," University of Arizona *Bulletin* 22, no. 4). This compilation listed 5,612 dated specimens from 365 separate sites and gave discussions of the archaeological significance of the dates. Another development, not listed in the above publication, consisted of additions to the Southwestern Tree-ring calendar from Basket Maker II sites near Durango, Colo. The calendar extended to 58 B.C. and the earliest bark date was 46 A.D.

Plains.—The University of Nebraska, Lincoln, was host to the ninth Plains Conference for Archaeology on April 11 and 12. Donald D. Hartle described the excavation of Rock Village, an early 19th-century Hidatsa site located in Garrison reservoir in North Dakota. The houses discovered conform very well

to descriptions of Hidatsa dwellings of that period. The excavation of Fort Stevenson, a military post established late in the last century directly across the Missouri river from this Hidatsa village, was described by Hubert Smith.

A seriation of collared and uncollared rims from seven Upper Republican sites in Nebraska was presented by George Metcalf. This study promised to measure change within the ceramics of this cultural phase, but the existing data did not indicate which end of the sequence was most recent. E. Mott Davis of the Nebraska State museum, Lincoln, reported on the work of that institution at the Red Smoke site. This was an early preceramic station on Lime creek in the Medicine Creek reservoir area. The most important finding was the association of Plainview and Meserve types of projectile points in the same levels.

Eastern United States.—The Illinois State museum, Springfield, issued the fifth volume in its scientific series, the first devoted to archaeology (*Hopewellian Communities in Illinois*, edited by Thorne Deuel). The five papers in this volume added to the evidence that there was cultural change within the Hopewell culture. It was most interesting that the cultural complex which had been determined to be early Hopewell (radiocarbon date about 0-200 B.C.) had a number of similarities to the comb-ceramic cultures of Siberia and Japan.

The museum at Ocmulgee National monument, near Macon, Ga., was completed and opened to the public. It was one of the best arranged of the smaller archaeological museums.

The archaeological research of Florida State university, Tallahassee, was centred on preceramic sites in southern Jefferson county. The number of these sites discovered indicated that there was a fairly large early population. Ripley P. Bullen of the Florida park service excavated a Weeden Island period site at the Manatee Springs state park. Many artifacts were found in the small village site but unfortunately Bullen did not succeed in working out house patterns, a badly needed type of information for this period.

James A. Ford of the American Museum of Natural History, New York, N.Y., conducted brief exploratory excavations at the Poverty Point site in northern Louisiana. An examination of aerial photographs revealed that there is a remarkable arrangement of six concentric earth embankments lying to the east of the 70-ft. high mound that stands on this site. The outermost embankment is three quarters of a mile in diameter. Trenches across these embankments demonstrated that they are artificial and were constructed during the period of the preceramic Poverty Point cultural complex. The entire construction seemed to be related to an old channel of the Mississippi river which geological studies had dated as about 1500 B.C. However, the radiocarbon date for a site of the same culture, excavated the preceding year in Mississippi by Ford and Philip Phillips of Harvard university, was 399±80 B.C.

Middle America.—The most spectacular discovery of the year was made in the Temple of the Inscriptions at Palenque, Mex. For the last four field seasons Alberto Ruz Lhuillier of the Instituto Nacional de Antropología e Historia had been engaged in clearing a rubble-filled stairway that was discovered underneath a stone slab that forms part of the floor of the temple. This stairway led down to the base of the 20-m. pyramid which forms the foundation for the building. In the spring of 1952 a stone doorway was discovered at the foot of the stairs and this gave access to a vaulted chamber. The walls of this chamber were covered with typical Maya paintings, somewhat damaged by lime deposits. In the centre of the chamber was a sealed stone sarcophagus richly carved in low relief and sitting on low stone blocks. Late in the year, this casket had not been opened because considerable preliminary work was necessary to ensure that the heavy stone lid could be raised without damage to the

box or its contents.

The Carnegie Institution of Washington, D.C., continued its Maya area program. The map of the numerous house mounds at Mayapán was completed and several of the smaller structures excavated. Graves were discovered beneath the house floors. R. E. Smith also dug in one of the many cenotes at the site. This had a stairway leading down to the water and an artificial platform on the floor of the cavern. E. M. Shook completed a study of the great wall which surrounded the city, and T. Proskouriakoff began recording the numerous sculptures that had been found.

J. Charles Kelley and a party of 14 students from the Southern Illinois university, Carbondale, excavated a series of sites in the vicinity of Durango, Mex. Their most important results were secured at a large mountain-top site north of Durango where stone-walled houses were arranged on terraces. The architectural aspects of this site appeared Mexican, but the artifact contents seemed to be more closely related to the southwest. The majority was plain buff and plain redware, with minor percentages of simple red-on-brown and red-on-buff. This new cultural phase promised to assist in filling the gap that was formerly thought to exist between the cultures of Mexico and the southwestern United States.

South America.—Stig Rydén of the Gothenburg museum, Göteborg, Swed., terminated a year of work at Cochabamba and other sites in Bolivia. Excellent results were secured but unfortunately he was not granted permission to export study collections. This delayed report of his findings.

In Peru, Duncan Strong of Columbia university headed a party working in Nazca valley. Stratigraphic excavations in refuse deposits had clarified the chronology of this portion of the south coast which had formerly been deduced from cemetery finds.

The Instituto de Archaeología de la Serena of Chile continued investigation of problems of Diaguita culture. (See also ANTHROPOLOGY.) (J. A. FD.)

Archery. The 68th annual National Archery association tournament was held at Jackson, Mich., Aug. 4-9, 1952, with 148 archers participating. Several new records were established at this time. The championship scores of the winners in

Target Archery

Men's championship	Robert Larsen, Phoenix, Ariz.
Scores: Double York round	279-1,653
Double American round	180-1,460 3,113
Ladies' championship	Ann Weber Corby, Denville, N.J.
Scores: Double National round	143-1,103
Double Columbia round	142-1,188
Double American round	180-1,388 3,679
Junior boys' championship	Robert Schafer, Kalamazoo, Mich.
Scores: Double Hereford round	276-1,760
Double American round	180-1,288 3,048
Junior girls' championship	Lorna Price, Phoenix, Ariz.
Scores: Double National round	143-977
Double Columbia round	144-1,112
Double American round	179-1,335 3,424
Intermediate boys' championship	Ronald Ockerman, Fairborn, O.
Scores: Quadruple Jr. American round	359-2,631
Intermediate girls' championship	Ann Marston, Wyandotte, Mich.
Scores: Double Columbia round	144-1,016
Double Jr. American round	179-1,277 2,293
Beginner boys' championship	Gary Dustin Hall, Tecumseh, Mich.
Scores: Quadruple Jr. Columbia round	277-1,762
Beginner girls' championship	Judy Myrick, Chicago, Ill.
Scores: Quadruple Jr. Columbia round	88-364

Crossbow

Men's championship	George M. Stevens, Marcella, Ark.
Scores: Double American round	180-1,252
Double American round	172-1,068 2,320
Ladies' championship	Alice Smith, Jackson, Mich.
Scores: Double American round	150-770
Double American round	145-757 1,527

Clout Shoot

Men	(36 arrows at 180 yd.)	Max Hamilton, Phoenix, Ariz.	36-268
Ladies	(36 arrows at 140 yd.)	Ann Corby, Denville, N. J.	36-266
Ladies	(36 arrows at 120 yd.)	Sylvia Wesendank, Little Rock, Ark.	36-280
		Jean Lee, Greenfield, Mass.	
Boys	(36 arrows at 120 yd.)	Bob Schafer, Kalamazoo, Mich.	36-276
Girls	(36 arrows at 120 yd.)	Lorna Price, Phoenix, Ariz.	36-298

the men's, women's and junior divisions were as shown in the table.

The Phoenician Archers (Phoenix, Ariz.) with a team of four men again won the men's team round event (96 arrows at 60 yd.) with a total score of 378-2,582. The North Detroit Archers of Detroit, Mich., won the ladies' team round (96 arrows at 50 yd.) with a total score of 380-2,566. Mrs. Ann Weber Corby of Denville, N.J., topped the previous records in the double national and double Columbia rounds. Competition between Mrs. Corby and Jean Lee, champion for the previous three years, was keen and scores were close throughout the entire tournament.

The 69th annual tournament of the National Archery association was to be held at Amherst, Mass., Aug. 10-14, 1953.

Jean Lee of Greenfield, Mass., captured the world women's championship crown for the second time when she participated at Brussels, Belg., July 23-28, 1952. Her total score was 3,815. Mrs. Jean Richards of Laguna Beach, Calif., took second place with a total score of 3,035.

The team round was won by the archers of the United States.

The 1953 world championships were to be held at Madrid, Sp., July 22-28.

(L. E. Bs.)

Architecture. Among the chief factors influencing the architectural profession in the United States during 1952 were the easing of government controls on key building materials and credit financing, coupled with a realization on the part of investors that building costs were not likely to decline for an extended period and might mount appreciably in the foreseeable future. The early part of the year was unmarked by any great change from that of 1951. Government and defense building still represented the major share of large projects. Various surveys and reports indicated that roughly one-half of the architectural firms experienced some decline in business but that one-quarter of the firms reported a definite rise which was largely tied in with government and defense industry contracts. Beginning in the second quarter of the year, acceleration was noted in new work covering a broader range of projects as well as modernization work on most classes of structures.

The quality of work executed was notable. Serious effort was directed toward enhancing the efficiency and "livability" of both commercial and domestic structures that promised to have important social and economic significance in all parts of the country. Seldom before had the amenities of comfortable living and working conditions been more widely considered. This applied in factories, laboratories, office buildings, institutions, housing projects, apartments, private residential work and throughout most types of buildings.

From the aesthetic point of view, the major works showed high standards of distinction in design marked often by a restrained purism and sparing use of thoughtfully controlled enrichment, as in Skidmore, Owings and Merrill's new Lever house in New York city.

From the engineering point of view, the year was marked by further experimentation in methods of construction, new materials and ingenious employment of mechanical equipment. For example, one of the first buildings in America to utilize prestressed concrete as a structural system was erected on the new \$9,000,000 campus of Manhattanville college at Purchase, N.Y., from the designs of Eggers and Higgins. Among other structural innovations of interest were the 75-ft.-span light ribbed timber roof employed by E. J. Bartel in Newton, Kan., and the 222-ft. diameter thinly spun dome of the Jordan Marsh store in Shoppers' World at Framingham, Mass., designed by Ketchum, Gina and Sharp.

Governmental Buildings.—The United Nations' group in New York, as the conference building and the general assembly

building were completed, proved the outstanding architectural attraction for critics. While the secretariat building was described on one hand as a potential fragmentation bomb in case of war, on the other the whole group was interpreted as a laboratory for the engineering of world peace. The architects' whole conception became more apparent as the project drew toward completion and respect mounted for the collaborative design effort headed by Wallace K. Harrison.

Office Buildings.—For the first time since World War II, the desire to achieve office buildings that are also civic monuments manifested itself in several cities. In some of these, potential revenue was sacrificed to attain distinguished design results and increased desirability of occupied space. Most conspicuous of these was Lever house in New York city, which utilizes a splendid open court with fine planting effects which permanently protect the light source of the glass-sheathed main mass of the building and add distinction, although reportedly sacrificing a potential \$200,000 per year of valuable rental space in order to do so.

The new 41-story Prudential building by Naess and Murphy, which was under construction in Chicago, Ill., was designed to offer its tenants unusual luxury services, rather than competitive rents.

The Alcoa building, Pittsburgh, Pa., by Harrison and Abramovitz, dramatically capitalized on its Golden Triangle location. Using aluminum extensively for exterior wall panels the building was, perhaps, the lightest weight building of comparable dimension. It used ingenious sealed yet easily washed from the inside windows, inside ceilings, ducts and piping in conjunction with a steel frame, fireproofed with foam concrete. Rino Levi's new co-operatively owned and occupied office building in São Paulo, Brazil, used glass of graded translucence on each of its 15 stories on the cool fronts and employed solid walls largely on those fronts exposed to intense sunlight.

Schools and Colleges.—Unusual activity continued in the construction of public schools. Except in congested urban areas, there was a marked trend toward low spreading buildings, often employing noise-buffer courts and easy relationship to the out of doors. Attractiveness and increased livability from the pupil's point of view were admirably achieved, as in Flewelling and Moody's new El Segundo (Calif.) public school and the Portola Junior high at El Cerrito, Calif., by Miller and Warnecke. Activity in college and university building was highlighted by the spectacular Ciudad university near Mexico City, where Carlo Lazo co-ordinated the services of 140 architects in designing a new campus to accommodate 26,000 students with facilities which included a stadium seating 110,000. Frank Lloyd Wright's continuation of his notable project of a new campus for Florida Southern college, Lakeland, Fla., was of marked architectural interest.

Hospitals.—The year saw the completion of the 40th Veterans administration hospital since the end of World War II. Among the many hospital projects of merit should be mentioned the New York University Bellevue Medical centre and the medical centre for Ohio State university, Columbus, both by Skidmore, Owings and Merrill; St. Mary hospital, Pueblo, Colo., by Fisher and Fisher; and the neurology building at Philadelphia General hospital by Harbeson, Hough, Livingston and Larson.

Suburban Merchandizing Centres.—The marked trend in development of large-scale suburban extensions of metropolitan shopping facilities continued unabated as highlighted in Detroit's \$18,000,000 Northland Shopping centre by Victor Gruen and San Francisco's \$6,000,000 Macy store in the Hillsdale development by Welton Becket and Associates.

Housing Developments.—Under continuing authorization of the Federal Housing act of 1949, 50,000 housing units were

Above: SKELETON of the dome capping the General Assembly building at U.N. headquarters in New York city. The Assembly hall was completed late in 1952. In the background looms the slablike Secretariat building

undertaken in the first half of 1952. Added to other thousands of units which were privately financed, the total was impressive in numbers, but small compared with the need. During the first seven months of the year it was estimated that 670,000 homes were started (about 1½% less than in 1951).

In the field of small houses, the contractor-sponsored "estate" grouping was pronounced but the trend was to offer the purchaser more space for his money and increasingly the builder found it financially advisable to enlist the professional services of the well-trained architect to assure the success of his project. The large-scale residence continued to be a highly exceptional occurrence but the moderate size house geared to informal, efficient and pleasant living was noteworthy in numerous cases, such as the Rawson house on Long Island, N.Y., by Petroff and Clarkson and the subtropical house for Roland Phillips at Miami, Fla., by Igor B. Plevitzky.

Industrial Building.—Among the many important industrial projects should be noted the Armstrong Cork laboratories near Lancaster, Pa., by Shreve, Lamb and Harmon; the Budd Co. Chase plant at Gary, Ind., by Giffels & Vallet and L. Rossetti; the TVA Kingston (Tenn.) Steam plant by the TVA division of design; and the completed first unit of Columbia Broadcasting's Television city in Hollywood, Calif., by Pereira and Luckman.

Ecclesiastical Building.—There were two buildings in Missouri by J. D. Murphy that command attention, namely, St. Peter's in Kirkwood and St. Ann's in Normandy. Percival Goodman and Associates' Temple Beth Israel at Lima, O., and Kivett & Meyer's synagogue and school in Kansas City, Mo., were resourceful designs of distinction, representing different aesthetic approaches to the problem.

In summary it can be said the architectural profession held its own both in quality and extent of work accomplished. While final figures had not yet been tabulated, it appeared that the U.S. departments of commerce and labour's estimate of \$32,200,000,000 of new construction for the year (about \$1,000,000,000 more than for 1951) would easily be reached.

(J. G. V. D.)

Great Britain.—In Great Britain 1952 was remarkable less for the completion of any spectacular buildings than for gradual but steady progress in realizing plans laid in previous years. Among a number of excellent schools completed to the designs of the London County council architect's department (Robert H. Matthew, architect in charge) was a primary school for 100 children at Benbow street, Deptford. The construction was of a light welded, galvanized steel frame with walls of precast concrete slabs. Another L.C.C. school (one of the first schools to use prestressed concrete) was built in Poplar to the designs of Cecil Handisyde in association with Hammet and Norton; Felix S. Samuely was consulting engineer. The system, designed for a multistory structure, was as follows: structural columns of *in situ* reinforced concrete; main beams of prestressed concrete soffits with precast trough-shaped units between and *in situ* concrete poured on top to bond the whole into one monolithic structure.

A large housing scheme at Priory Green, Finsbury, London, designed by Tecton with Skinner, Bailey and Lubetkin as executive architects, was occupied during the summer. It comprised 269 flats in two eight-story and four four-story blocks. Construction—the same for all blocks—was reinforced concrete cross walls varying from 5 in. to 7 in. in thickness, with reinforced concrete floor slabs 4½ in. thick. The main elevations were divided into panels with an infilling of 4½-in. brickwork with straight vertical joints, separated from an inner lining of 2¼-in. cell concrete by a 2-in. air cavity. The ends of the reinforced concrete cross walls were covered by cast-iron downpipes, and

the edges of the floor slabs with horizontal gutters, both of rectangular section.

The "Commonwealth house" was exhibited on a site near New bridge, Middlesex. Designed by C. A. V. Smith and J. P. Meckridge, an Australian architect, it was intended mainly for export. In view of the shortage of skilled building labour in the colonies, the aim was to produce a house capable of quick erection by average handymen and occupying the minimum of shipping space. It was hoped eventually to produce 20,000 of the houses each year. The estimated cost for a minimum of ten houses was £1,150 each (free on board). The total floor area provided was 905 sq.ft.

In the new towns housing was well under way: most spectacular were the large blocks of flats (small though the proportion of these to houses would be). At Sish lane, Stevenage, Hertfordshire, the firm of Yorke, Rosenberg and Mardall was responsible for a group of buildings which included a seven-story block. This was constructed with a reinforced concrete box frame with no projecting beams or columns. Where cross wall and floor slabs projected beyond the main building face they were covered with blue-gray frostproof eggshell glazed tiling. Flank walls were finished outside with panels of 4½-in. brick in Flemish bond, the headers having snapped ends facing outward and allowed to project to random lengths, giving a rich textural effect. The whole scheme comprised 110 flats in all with 54 flats in the seven-story block and the rest in two- and three-story blocks.

By the end of the year demolition of the temporary Festival of Britain exhibition buildings on the South Bank site, London, was completed. Several of the buildings in the downstream section were retained, among them the Telekinema for use as the National Film theatre, and the former administration building for use as offices by the Council of Industrial Design.

South Africa.—A number of tall office and flat buildings were erected in Johannesburg. Nearly all of them exhibited similar characteristics: a frank expression of the grid structure in the elevations; unpretentious but well-considered detailing; and well-balanced handling of texture and pattern. Groot Drakenstein, a typical block of luxury bachelor flats, was 13 stories high, all flats consisting of a single living room with dining recess and balcony, and separate kitchen and bathroom. The framework was reinforced concrete with a panel infilling of red and plum-coloured rustic bricks. The architects were H. H. Le Roith and Partners.

Europe.—Denmark.—In Copenhagen a 14-story office building was completed to the designs of Mogens Jacobsen and Alex Poulsen. The structure was of reinforced concrete with a facing of prefabricated panels. Two noteworthy small houses both showed American influence. One at Vedbaek, built by the architect Haldor Gunegsson for himself, acknowledged a debt to Frank Lloyd Wright with its brick walls, shingle roof and large sliding glass doors. The other at Hellebaek near Elsinore, again built by an architect, Jorn Utzon, for himself, was nearer in manner to the houses of the San Francisco bay region. All the outer walls were of glass but for the north wall which was of yellow bricks and entirely without windows. The roof was surfaced with aluminum.

France.—Plans for the new Paris headquarters building for the United Nations Educational, Scientific and Cultural organization were published in November. The estimated cost of the building was £2,750,000. The money would be made available as an interest-free loan by the French government. The architects were Marcel Breuer (U.S.), Bernard Zehrufuss (France) and Eero Saarinen (U.S.), with Pier Luigi Nervi (Italy) as engineer. A consultant advisory panel included Lucio Costa (Brazil), Walter Gropius (U.S.), Le Corbusier (France), Sven Markelius (Sweden) and Ernesto Rogers (Italy). The site chosen was one

bordering the Bois de Boulogne between the Porte Dauphine and the Porte Maillot. The scheme comprised three main blocks: a 16-story slab structure containing offices and, in a lower block, a hall for conferences; linking them would be a rectangular four-story block containing the delegates' lounges, committee and board rooms, patios, restaurant, library and ancillary rooms. The structure would be of reinforced concrete throughout. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; TOWN AND REGIONAL PLANNING.) (I. R. M. M.)

Areas and Populations of the Countries

of the World. The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or official estimates are given for each country. Areas in square miles are in accordance with the boundaries for the year of the population figure unless otherwise noted. Some of the later boundary adjustments had not been recognized at the end of 1952 by the U.S. government. The subtotals for colonial groupings within continents do not carry density figures.

Where two figures are given for a country, the most recent is used in the continental and world totals.

The table provides a fundamental basis for country comparisons.

Areas and Populations of the Countries of the World—Continued

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.

Argentina. A republic occupying the southeasternmost section of South America, Argentina is bounded on the north by Paraguay, Bolivia and Brazil; on the south and west by Chile; and on the east by Uruguay, the River Plate and the Atlantic ocean. It is the second largest Latin-American nation—only Brazil is larger—with an area of 1,079,965 sq.mi. and a population of 17,641,000 (est. 1951), mostly of European ancestry. The capital and leading port, Buenos Aires, has 3,371,000 inhabitants (est. 1950). Other leading cities are: Rosario, 467,937; Córdoba, 369,886; Avellaneda, 279,572; Eva Perón (La Plata), 271,738; Lanús, 242,760; Tucumán, 194,166; Santa Fé, 168,791; Lomas de Zamora, 125,943; Mar del Plata, 114,729; Mendoza, 105,328; and Bahía Blanca, 112,597. Religion: Chris-

tian, mostly Roman Catholic. President in 1952: Gen. Juan D. Perón (*q.v.*).

History.—During 1952 the Perón regime, although apparently secure in power, continued its curtailment of civil liberties and blamed foreign interference for the difficulties faced by the nation. The economic situation continued bad, although some attempts were made to correct it.

President Perón started the year with conciliatory gestures by announcing that he expected a loyal opposition and by freeing some political prisoners, including two deputies. These peaceful overtures, however, did not last very long. In mid-January 61 persons, including 25 women, were arrested for belonging to an association known as the "Board for Better Social Conditions," which was identified as an opposition group. Several incidents of people jailed for opposing the regime were reported by the press.

The cost of living was reported to have gone up 80% since Sept. 1949. The Argentine peso, valued at 4 to U.S. \$1 in 1947, reached 30 to U.S. \$1 in the black market. The drought had been severe during the last two years and the government's economic policy had not provided any incentive for farmers to increase production. The nationalization of the railroads had not produced the economic benefits expected. Fares had been increased, but no improvement of the property or the rolling stock had been made.

The government blamed the economic crisis on increased consumption in Argentina and abroad. The Unión Cívica Radical, leading opposition party, however, quoted official statistics to prove that the crisis was caused by curtailed production. In 1941 Argentina produced 8,150,000 tons of wheat compared with 5,200,000 tons in 1949; in 1941 it produced 10,238,000 tons of corn compared with 6,788,000 in 1949; in 1941, 22,232,000 tons of linseed were produced while in 1949 only 11,876,000 tons were grown. In 1941 there were 20,517,000 ha. under cultivation while in 1949 there were only 15,876,000 ha. cultivated.

In February Perón announced an austerity plan to increase production and reduce consumption. He set the example by giving up one month of his own salary, and urged the nation to utilize food to the maximum extent possible and to reduce wastage. Two meatless days a week were proclaimed throughout the nation, gasoline consumption was reduced by 50%, ten Argentine consulates abroad were closed, payments to farmers were increased 33%, all production was to be increased 20%, cattle were not to be slaughtered until they had attained full growth, prices were frozen, and salaries were to be increased according to a set scale. These raises would include all increases since 1949.

Further control and centralization was promised by Perón in a speech to provincial governors when he announced that in the future all public works would be controlled by a federal council; the national congress would pass a penal code for the entire nation and the codes approved by the provinces would be repealed; the ministry of education would exercise greater control over all schools; and all social welfare activities would be under the Eva Perón foundation. Perón also announced that the organization of the Peronista party would be decentralized and moved to the provinces in order to develop more party leaders.

Although a new United States ambassador, Albert F. Nufer, was appointed in April, relations between the two countries remained cold and distant. Early in the year Saul S. Saulson, a U.S. citizen, was arrested for alleged participation in local

MASSES OF FLOWERS for Eva Perón banking the street near the General Confederation of Labour building where her body lay in state in Buenos Aires, Arg. Señora Perón died on July 26, 1952

politics. Later Roberto Mujica Lainez, Argentine employee of the United States Information service, was arrested and held for more than nine hours. Perón told a visiting delegation of United States businessmen that he welcomed foreign capital, but so far foreign investments in Argentina had been few. The United States was blamed for plots against the government and Perón.

In March when the national congress met, with women for the first time holding 26 legislative seats, Perón and J. Hortensio Quijano were proclaimed president and vice-president respectively. Final revised figures for the Nov. 1951 elections were announced. The Peronista party received 4,745,168 votes; the Unión Cívica Radical 2,415,795; the Partido Demócrata (Conservative) 175,399; the Communists 71,318; the Socialists 54,920 and about 10,000 votes were scattered among minor parties. Quijano died prior to his inauguration and a minor constitutional crisis developed because there was some confusion as to the manner of designating his successor. In September congress designated Adm. Alberto Teisaire, president of the senate, as vice-president of the republic.

On July 26 Eva Perón's death shocked the nation. Thousands of Argentines paid their last respects to Señora Perón as her body lay in state, thus proving her popularity and hold on the masses. Her husband assumed the functions she had fulfilled in the ministry of labour and the Eva Perón foundation. Prior to her death La Pampa territory was redesignated Eva Perón province and after her death the city of La Plata was renamed in her honour.

(J. McAd.)

Education.—On June 30, 1951, there were 15,874 primary schools with 2,446,138 pupils and 101,646 teachers. There were 2,069 public secondary, normal and special schools with 360,917 students and 46,204 teachers; 32 autonomous schools with 2,544 students and 206 teachers; and 1,132 private schools with 153,926 students and 4,993 teachers. There were national universities at Buenos Aires (41,325 students), La Plata (7,409), Córdoba (9,355), Cuyo (2,596), Tucumán (3,191) and the national university of the Litoral at Santa Fé (16,325). University professors totalled 3,621. In 1951 there were 2,190 motion-picture theatres with seating capacity of 957,209.

Finance.—The monetary unit is the peso, valued on Aug. 28, 1952, at \$0.1333 U.S. currency, basic rate; \$0.2000, preferential rate; and \$0.0714, free market rate. The 1953 budget as approved by congress in Sept. 1952 allocated 8,320,900,000 pesos for the national administration (to be covered by general revenues estimated at 8,354,500,000 pesos), 1,110,000,000 pesos for public works and other capital expenditures (to be covered by borrowing), 3,657,600,000 pesos for autonomous agencies (self-balancing) and 2,703,000,000 pesos for special accounts (self-balancing). Allocations for the 1953-58 five-year plan were to be made later. Expenditure of the national administration amounted to 5,102,300,000 pesos in 1950; general revenue was 5,202,300,000 pesos. The national debt was 18,158,400,000 pesos on Dec. 31, 1950 (Dec. 31, 1949: 15,194,500,000 pesos), of which 15,996,900,000 pesos represented the funded debt and 2,161,500,000 pesos the short-term floating debt. The debt figures did not include the floating debt at call or the debt of the official agencies and of provincial and municipal governments. Currency and subsidiary money in circulation on Aug. 31, 1952, totalled 15,153,000,000 pesos, and on that date the Central bank had gold holdings of \$268,000,000. The cost of living index (Buenos Aires) stood at 314 in April 1952 (1948 = 100).

Trade and Communications.—Exports in 1951 were officially valued at 6,709,200,000 pesos and imports at 10,491,900,000 pesos (provisional figures). Leading exports were cereals and linseed (23%), meat (16%), wool (14%), hides (9%) and forest products (5%); leading imports, machinery and vehicles (19%), iron and steel and manufactures (15%), fuel and lubricants (10%), textiles (10%) and timber (9%). Leading customers were the U.S. (18%), the United Kingdom (18%), Brazil (10%), Italy (7%) and Germany (7%); leading suppliers, the U.S. (20%), Brazil (9%), the United Kingdom (7%), Germany (6%) and Sweden (5%).

Railway mileage (1949) totalled 26,923 and that of the national highways about 43,500. Registered motor vehicles on Jan. 1, 1951, included 275,000 cars, 140,000 trucks and 16,000 buses. Argentine air lines flew 9,481,300 mi. in 1951 and carried 296,100 passengers. According to *Lloyd's Register of Shipping*, the merchant marine (June 30, 1951) consisted of 363 steamers and motor ships (100 tons and over) aggregating 979,210 gross tons.

Agriculture.—Production figures for the crop year 1951-52 were officially reported as follows (in metric tons): wheat 2,050,000; rye 87,000; barley 349,000; oats 442,000; millet 214,000; maize 1,990,000; linseed 302,300; sunflower 660,000; raw cotton 399,000; rice (rough) 191,000; tobacco 35,100; yerba maté (1951) 106,200; sugar cane (1950-51) 8,415,600. Exports in 1951 (metric tons) included wheat 2,454,900; maize 297,900; linseed 181,000; oats 112,500; barley 154,500; rye 203,000.

The livestock census of July 1, 1947, showed 41,268,470 cattle, 7,237,663 horses, 50,856,556 sheep, 2,981,406 pigs and 4,933,679 goats. Wool exports in the wool year ending Sept. 30, 1952, were reported unofficially at 96,061 bales, of which 61,935 bales went to the U.S. In 1951, 1,652-

582 frozen beef quarters, 118,688 mutton carcasses and 788,436 lamb carcasses were exported. Quebracho extract exports (including re-exports) totalled 258,000 metric tons in 1951.

Manufactures.—Industrial establishments numbered 101,884 in 1947 (65,803 in 1943). Industrial employment in June 1950 totalled 917,700 persons, of whom 210,600 were employed in the food and beverage industries and 132,900 in the textile industry. Official production figures for 1951 included portland cement 1,540,600 metric tons; flour 2,013,000 tons; soap 147,400 tons; paper 141,473 tons; quebracho extract 218,100 tons; cotton yarn 91,320 tons; manufactured gas 274,924,000 cu.m.; electric energy 4,718,007,000 kw.hr.

Mineral Production.—Petroleum production totalled 3,889,600 cu.m. (about 25,150,000 bbl.) in 1951. Production of lead totalled 35,736 metric tons and zinc 31,480 tons. Coal imports were 2,167,600 metric tons, about two-thirds of which came from the U.S.

Arizona. Arizona, called the "Grand Canyon state," lies in the southwestern part of the United States, being bounded on the west by the Colorado river and Nevada and on the south by Mexico. The area is 113,575 sq.mi. The population (1950 census) was 749,587, an increase of 50.1% over that of 1940, 416,000 being urban and 333,587 rural. Whites composed 81.2%, Negroes 3.5% and Indians 8.8%. Based on increased school attendance, the population for 1952 was estimated at 827,113. The capital, Phoenix, had (1950) a population of 106,818; Tucson, 45,454; Mesa, 16,790; Douglas, 9,442; Yuma, 9,145; Glendale, 8,179; Tempe, 7,684; Flagstaff, 7,663; and Prescott, 6,764.

History.—State officers (1952), all Democrats except the Republican governor, were: chief justice, Levi S. Udall; governor, J. Howard Pyle; secretary of state, Wesley Bolin; treasurer, E. T. Williams, Jr.; attorney general, Fred O. Wilson; superintendent of public instruction, Marion L. Brooks. Since state elections occur every two years, the legislature was the same in 1952 as in 1951, the senate Democratic and the house largely so. One act was the repeal of an initiative measure, approved at the general election of 1948, providing for a retirement fund for employees in state, county and school corporations. There were three provisions for state reorganization and the creation of new departments to be submitted to the voters in 1952. Provision was made for increasing salaries of state and county officials. Since the underground water level had fallen from 90 ft. to 300 ft. in places, Governor Pyle had asked for an underground water control measure. An appropriation of \$100,000 was secured for a new ground water commission. A second session for the year was called in July to make an appropriation to match the government appropriation for old-age security.

Education.—The public schools reported for 1951-52 an enrolment with number of teachers as follows: elementary schools, 138,287 and 4,363; high schools, 33,424 and 1,599. The larger cities also had a considerable number of secondary and elementary private schools and parochial schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of recipients of state assistance in July 1952 was 20,124. The state welfare appropriations were: children's colony, \$274,836; industrial school, \$470,849; state hospital, \$1,768,189; crippled children service, \$275,000; pioneer home, \$173,157; prison, \$562,947; aid to the blind, \$244,796; dependent children, \$1,345,357; old-age assistance, \$3,916,500.

Communications.—The Arizona highway department reported the following mileage for 1952: state highways, 3,963; county roads, 15,368; federal aid highways, 2,514; national roads, 8,324. Railroad mileage was 2,617. The number of telephones, as of Aug. 31, was 182,993.

Table I.—Principal Crops of Arizona

	1952 Estimate	1951	Average, 1941-50
Barley, bu.	5,885,000	4,900,000	4,023,000
Wheat, bu.	468,000	572,000	571,000

Table II.—Mineral Production of Arizona

(In short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1950		1949	
Clays	224,000	\$ 512,000	190,000	\$ 433,000
Copper	403,000	167,773,000	359,000	141,450,000
Gold (oz.)	118,000	4,141,000	109,000	3,815,000
Lead	26,000	7,123,000	34,000	10,607,000
Lime	52,000	718,000	44,000	608,000
Sand and gravel	2,499,000	1,590,000	1,512,000	971,000
Silver (oz.)	5,325,000	4,820,000	4,971,000	4,499,000
Stone	228,000	140,000	356,000	203,000
Zinc	60,000	17,176,000	71,000	17,523,000
Other minerals	3,413,000	...	985,000
Total		\$207,406,000		\$181,094,000

Banking and Finance.—National banks, June 30, 1952, had deposits of \$405,999,727; loans and discounts, \$168,523,971; government securities, \$134,895,526. State banks had deposits of \$154,842,649; loans and discounts, \$48,085,558; government securities, \$67,299,637, the total being in excess of that of 1951. By the end of Aug. 1952, state tax collections reached \$37,634,086.16, the highest in the state's history, and there was a surplus in the treasury in excess of the state's debt.

Agriculture.—A report for 1951 placed the value of crops at \$298,364,000, and livestock and animal products at \$107,239,000.

Manufacturing.—In July 1952 there were 27,200 persons employed in manufacturing in the state. Wages for 1951 were \$64,491,802. The most important industries were: furniture, lumber and wood products, primary metal industries, clothing, food and kindred products. (H. A. H.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Arizona during 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Arizona ranks first in the production of copper, second in asbestos, third in zinc and fourth in silver, and stands 15th in the value of mineral output, with 1.75% of the U.S. total.

Arkansas. Arkansas, a south-central state of the United States, was admitted to the union in 1836. Its area is 53,104 sq.mi., including 429 sq.mi. of water. The 1950 official census showed a population total of 1,909,511, a decline of approximately 40,000 since 1940. The 1950 census figures placed 67% of the population in rural areas compared with 77.8% in 1940. The population was listed as 77.1% native white, .5% foreign born and 22.3% Negro.

Little Rock, the capital city, had 102,213 inhabitants in 1950. Other principal cities are: Fort Smith, 47,942; North Little Rock, 44,097; Pine Bluff, 37,162; Hot Springs, 29,307; El Dorado, 23,076; Fayetteville, 17,071; Jonesboro, 16,310; Blytheville, 16,234; Texarkana, 15,875.

History.—Francis Cherry, Jonesboro judge, defeated incumbent Sidney McMath for the Democratic nomination for governor in the Aug. 12, 1952, primary by a vote of 237,448 to 139,052. Other principal state officers nominated in the 1952 primary (such nomination is tantamount to election in Arkansas) were: Nathan Gordon, lieutenant governor; Tom Gentry, attorney general; C. G. Hall, secretary of state; J. Oscar Humphrey, auditor; J. Vance Clayton, treasurer; Claude Rankin, land commissioner.

Education.—For the school year of 1951-52 Arkansas had 2,061 elementary schools with an enrolment of 333,822, and 635 secondary schools with an enrolment of 78,304. Total college and university enrolment for 1951-52 was 20,971. Teachers and principals in elementary schools numbered 7,576; in secondary schools, 5,764. Expenditures from state funds for the year ending June 30, 1952, totalled \$20,731,305. A. B. Bonds, Jr., was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the fiscal year ending June 20, 1952, old-age assistance grants in the amount of \$15,641,555 were paid to a monthly average of 60,045 recipients. A monthly average of 13,797 families received a total of \$6,257,423 for dependent children; an average of 1,907 blind persons received a total of \$614,843; and an average of 2,427 general relief cases received \$381,202.31. For the three months of April, May and June 1952, an average of 159 permanently and totally disabled persons received a total of \$12,914. Mrs. Henry Bethel was commissioner of welfare.

Unemployment benefits paid during the fiscal year totalled \$5,647,080, a weekly average of \$16.76 to 36,616 beneficiaries. Arkansas maintained one penitentiary and four reformatories at a total expense of \$689,533.16. These institutions housed an average of 1,552 adults and 252 juvenile inmates.

Communications.—Expenditures by the state government on highways during the fiscal year ending June 30, 1952, totalled \$27,000,000. At the end of that period, the state highway system comprised 9,992 mi. County highways, not in the state system, had a mileage of 55,228. Approximately 6,000 mi. of roads in the state system were paved, surfaced or graded. Main-track railway mileage was 4,236.15; airway mileage, 850. There were 85 airports and two seaports. Approximately 274,800 telephones were in use in the state.

Banking and Finance.—Arkansas had 178 state and 52 national banks on

Table I.—Principal Crops of Arkansas

Crop	Indicated 1952	1951	Average 1941-50
Corn, bu.	14,471,000	23,218,000	28,821,000
Cotton, bales	1,250,000	1,249,000	1,373,000
Cottonseed, tons	"	524,000	557,000
Hay, tons	901,000	1,294,000	1,462,000
Rice, 100-lb. bags	9,340,000	9,011,000	6,871,000
Soybeans, bu.	13,920,000	12,444,000	4,759,000

Source: U.S. Department of Agriculture.

June 30, 1952. Deposits in state banks totalled \$383,179,000, resources \$417,988,000. Deposits in national banks totalled \$440,867,000, resources \$477,457,000. The six state and 35 federal savings and loan associations in Arkansas had combined resources of \$83,585,936. Real and personal property tax assessments, listed by law at 20% of value, totalled \$768,704,597. State treasury revenues during the fiscal year were \$101,207,000 and expenditures were \$99,699,000. Direct obligations totalled \$122,001,000.

Agriculture.—The U.S. bureau of agricultural economics estimated the value of crops harvested from 5,570,000 ac. in 1951 at \$454,562,000, an increase of \$24,577,000 over 1950. Production of field crops was 3% above 1950 but 2% below the 1941-50 average and 24% below the record production of 1948. Cotton was the state's most valuable crop in 1951, worth \$273,420,000. Rice ranked second with a value of \$45,055,000 (the second time in history that rice placed ahead of corn). The corn crop was valued at \$40,632,000; followed by hay, \$32,609,000; soybeans, \$32,354,000; and strawberries, \$6,259,000. Cash receipts to farmers from farm commodities sold during 1951 totalled \$564,519,000, a 10% increase over 1950. Of this total, livestock accounted for \$202,421,000, or 36% compared with 30% in 1940 and 26% in 1930.

Manufacturing.—Gross sales or receipts of all manufactured goods for 1951 totalled \$887,000,000, as reported by 3,389 manufacturing establishments. Wages in manufacturing during the year totalled approximately \$191,514,406 and were paid to a monthly average of 82,109 employees. During 1951, the state Resources and Development commission reported 103 new industrial plants established and substantial expansion made in 33 existing industries. The greatest number of new units were listed in food processing and chemical production plants. (S. McM.)

Table II.—Principal Industries of Arkansas

Industry	Gross sales or receipts 1951	1950
Food and kindred products	\$189,000,000	\$183,000,000
Chemicals and allied products	171,000,000	131,000,000
Lumber and products	166,000,000	181,000,000
Petroleum and coal products	90,000,000	95,000,000
Paper and allied products	61,000,000	64,000,000
Primary metal industries	45,000,000	48,000,000
Leather	25,000,000	26,000,000
Stone, clay and glass products	20,000,000	21,000,000

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Arkansas in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Arkansas ranks first among the states in the production of bauxite and barite, and stands 22nd in the value of mineral output, with 1% of the U.S. total.

Table III.—Mineral Production of Arkansas

(Short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1950		1949	
Barite	343,000	\$3,089,000	363,000	\$2,907,000
Bauxite	1,464,000	7,532,000	1,226,000	6,434,000
Clays	461,000	996,000	434,000	1,067,000
Coal	1,169,000	8,883,000	962,000	7,535,000
Natural gas (thousand cu.ft.)	48,047,000	1,682,000	47,788,000	1,912,000
Natural gasoline (bbl.)	1,395,000	3,926,000	1,427,000	4,080,000
Petroleum (bbl.)	31,108,000	76,530,000	29,986,000	74,360,000
Petroleum gases (bbl.)	938,000	1,197,000	853,000	1,492,000
Sand and gravel	4,118,000	3,447,000	2,507,000	2,129,000
Stone	3,953,000	7,419,000	1,279,000	2,247,000
Other minerals	3,941,000	...	5,360,000
Total		\$118,642,000		\$109,523,000

Armies of the World. Major developments affecting the ground forces of the world during 1952 were:

The North Atlantic Treaty nations met in Lisbon, Port., in February and agreed on the minimum forces necessary for the protection of western Europe.

The war in Korea continued to be stalemated just north of the 38th parallel with fighting confined to probing attacks until October, when the Chinese made a determined effort to capture the mountains protecting Seoul.

In Indochina the French gained momentary advantage in driving back the Viet-Minh in the beginning of the year only to lose

t in the Communist attacks during the fall. There was evidence of increased aid from the Chinese Communists to the Viet-Minh.

Great Britain was forced to use its troops to protect its rights in the Suez Canal Zone against Egyptian forces determined to drive all British from the area. A change in the Egyptian government followed the period of unrest and eased the crisis.

The sovietization of the eastern European armies continued, although there was also evidence of unrest and disaffection, particularly among the officer cadres.

North Atlantic Treaty Organization.—The council of the North Atlantic Treaty organization (NATO) met in Lisbon in February and reached agreement on the strength of the forces to be mobilized during 1952, the bases and facilities to be built, the creation of a six-nation European army, and the return of western Germany to equality and responsibility. The commitment for 1952 on the part of the member nations was for 50 divisions in various strengths of readiness.

The agreed-on principles for a treaty establishing the European Defense Community provided for an army comprising troops from six powers—France, West Germany, Italy, Belgium, the Netherlands and Luxembourg. This European army would be associated with the U.S. and British commonwealth troops under the common command of SHAPE (Supreme Headquarters, Allied Powers in Europe).

NATO forces conducted three main operations during 1952. In Operation "Holdfast," British, Dutch and Belgian troops practised defensive exercises. French and U.S. troops conducted airborne operations along the Rhine defense line in Operation "Equinox"; and in Operation "Ancient Wall" Italian Alpine troops practised the defense of key bases in the Alps.

In Exercise "Rosebush" two armoured divisions, the 1st French and the 2nd U.S., were charged with the mission of seizing Rhine bridges between Mainz and Coblenz, Ger. The U.S. 4th infantry division and 3rd French infantry division were to withhold the aggressor forces east of the Rhine for 72 hr. (See also NORTH ATLANTIC TREATY ORGANIZATION.)

United States.—The U.S. defense appropriation for the fiscal year 1953 (July 1, 1952–June 30, 1953) was \$46,610,938,912. The army's share of the budget was \$12,239,500,000.

Disposition.—During 1952 all of the regular infantry divisions were located overseas. Divisions stationed in the U.S. included two airborne, one armoured division and four national guard infantry divisions which had been called to active duty. Six U.S. divisions were engaged in Korea, two were stationed in Japan. In addition, the 7th army in Germany was composed of four infantry and one armoured divisions, plus a constabulary force.

Organization.—The average available strength of the army during 1952 was 1,552,000 men. Strength was maintained through the draft which had inducted more than 1,000,000 men since its resumption in 1950. During the year congress approved legislation which provided that the army would be backed by a portion of the 1,000,000-man ready reserve to be organized for the armed services. All other reserves would be in standby status. Standby reserves would be liable for service only in time of war or emergency declared by congress or when the ready reserve was exhausted. The congress also expressed its intent that veterans of Korean fighting should not be recalled for emergency service unless no other qualified reserves were available.

During 1952 the army recalled approximately 160,000 reserves for two-week periods of field training on a compulsory basis. Approximately 11,000 officers holding mobilization designations were required to report for 15-day mandatory training.

During the year the number of aircraft and pilots which were an integral part of the army increased greatly. Strength in aircraft and pilots numbered approximately 1,600, with a tenta-

GEN. DWIGHT D. EISENHOWER receiving the Médaille Militaire, highest French military honour, from Premier Antoine Pinay in May 1952. The general was taking formal leave of Paris as commander of Allied powers in Europe

tive goal of between 3,000 and 4,000 planes and helicopters. There was no army aviation corps or branch, but eight branches utilized aircraft organically: infantry, artillery, armour, engineers, signal corps, ordnance, transportation and medical corps. For example, each infantry division received 26 aircraft of which 10 were helicopters and the balance light aircraft for observation purposes.

Training.—Training exercises held by the U.S. during 1952 included Exercise "Pine Ridge," held in the Elkins, W.Va., area during August and September to train troops for cross-country operations in rough, mountainous terrain.

Exercise "Longhorn," held in Texas, was the largest army-air force manoeuvre held since World War II. Troop carrier operations were conducted in cross co-ordination with the technical air control system, making the radar control facilities in the forward areas direct air drops. This enabled much greater accuracy in dropping men and cargo to ground units in close proximity to the enemy. It also provided for the eventual elimination of "Pathfinder" techniques wherein advanced parties were dropped in a paratroop invasion area in advance to guide in the main force. New armoured techniques were also developed in Exercise "Longhorn," with the 1st armoured division making use of the 100th heavy tank battalion in company strength. Armoured-air co-ordination was improved with air force officers riding in the advance tanks. At the conclusion of the exercise, the 31st infantry division was air-transported from Texas to its regular training centre at Camp Atterbury, Ind.

A second major exercise, "Snowfall," tested 32,000 troops and about 200 aircraft in cold weather conditions. The exercise included air drops, night attacks and offensive and defensive operations with simulated atomic weapons. Major units engaged

in this exercise included the 11th airborne division and 3rd armoured cavalry. The principal objective in the exercise, in addition to testing equipment, was to determine what use could be made of airborne troops when facing atomic weapons.

The army announced that professional and scientific men called in the draft would receive only half the normal basic infantry training, to be immediately followed by specialists' training in such fields as physics, chemistry, engineering, etc.

Equipment.—A new lightweight air-to-ground plane was developed for the army during 1952 to provide close air-ground support. The FD-25 Defender with a speed range of 35 to 182 m.p.h., cruising range of 630 mi., was designed to provide battalion support. The plane carried forty 2.75-in. rockets, or 32 individually launched 2.75-in. rockets, or four 5-in. rockets. In place of the rockets the Defender could carry two 40-gal. napalm bombs or two 250-lb. general purpose bombs. The plane's fixed armament consisted of two .30-calibre machine guns.

Troops in Korea tested an all-nylon lightweight armoured vest weighing approximately eight pounds. The vest was designed as protection against mortar, grenade and shell fragments.

Exercise "Snowfall" provided a test for winter equipment. Camouflage was one of the major problems. No satisfactory winter boots had yet been developed. A larger arctic tent was required, as was better ski equipment.

Reports indicated that the army had developed atomic shells which could be fired from heavy artillery of the 8-in. howitzer type. Tests were conducted at Yucca Flat, near Las Vegas, Nev., with troops located in the area of atomic blasts. The artillery piece weighed 85 tons, was 280 mm. and was transported by front and rear tractors. It could be placed in a position and fired in 15 min. The range of the weapon was approximately 20 mi. (See also ATOMIC ENERGY.)

New equipment was developed for the army anti-aircraft command, including radar-controlled fully automatic 77-mm. guns and guided missiles. These were in addition to the 90-mm. and 120-mm. anti-aircraft guns.

An improved model of the jeep was produced. The new model cost less, consumed less gasoline, and had a splashproof ignition system for driving in shallow water. The new version was pow-

ered with a 72-h.p. engine, compared with the old 60-h.p., and had a machine-gun mount for protection of the crew.

A new M-48 or Patton-48 tank was tested by the army. The tank, which weighed 49 tons, was powered by a 810-h.p. air-cooled engine with cross drive transmission. It had a lower silhouette than any other U.S. tank and an egg-shaped sloping elliptical hull and turret, increasing the difficulty of shell penetration. This tank had wider treads than previous medium tanks. It carried a crew of four and mounted a high velocity 90-mm. gun with removable tube that could be quickly replaced in the field. It also carried two .50-calibre and one .30-calibre machine guns.

The M-47 tank was adopted as the new medium tank of the army. This tank weighed 48 tons, carried a crew of five, had an air-cooled 810-h.p. engine, and was equipped with a 90-mm. high-velocity gun. (See also MUNITIONS OF WAR.)

U.S.S.R.—The official version of the defense appropriation gave a figure of 23.8% of the record budget of \$119,000,000,000. This appropriation was approximately 18% larger than that for the preceding year. The increased budget was slated for additional production of guns and tanks and expansion to the armament industry.

Disposition.—There continued to be 36 Soviet divisions in east Germany, although only 22 of these divisions were at combat strength, totalling approximately 230,000 men. The remaining divisional headquarters were for administration of various technical units and anti-aircraft and anti-tank regiments. The 22 line divisions were believed to be at approximately 95% of strength (the normal strength of a Soviet division being around 8,000 men). It was reported that the class of 1930 was sent home from Germany and demobilized. There were reports, unconfirmed, that the Soviets planned to send additional line divisions to east Germany. In addition to the Soviet divisions in Germany, there were approximately four divisions in Austria and six in Poland. Two of the divisions in Poland were armoured. A strategic reserve of 30 combat divisions was reported to be stationed in the Minsk-Leningrad area.

Over-all strength of the Soviet army continued at approximately 175 divisions. However, in addition to regular troops, the Voluntary Society for Assistance to the Armed Forces continued to train approximately 16,000,000 civilians in various military techniques. This society engaged in training in rifles, grenade-throwing and other basic fundamentals of infantry fighting.

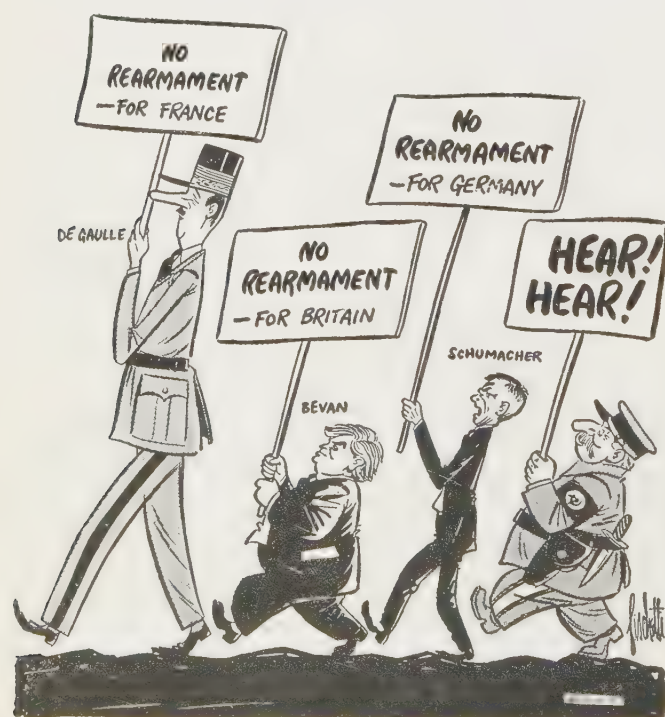

Reports indicated that the satellite nations had 70 active divisions under a peacetime establishment of 9,000 men to a division or a total of 630,000 men. The length of conscription in the satellite nations was two years and in some categories three. Estimated strengths in divisions included Poland 22, Hungary 16, Bulgaria 12, Rumania 15 and Czechoslovakia 15.

Equipment.—The Soviet group of armies in east Germany was refitted during the year with new field and anti-aircraft artillery and motor transport. This equipment was sent to the 18 tank or mechanized divisions.

The U.S.S.R. also continued to rearm the satellite armies. All old heavy equipment such as tanks, guns and trucks were replaced by modern Soviet material. However, the transformation of the satellite infantry divisions into Soviet-type mechanized rifle divisions was reported to be making slow progress. The U.S.S.R. was reported to rate the efficiency of the satellite armies in the following order: Bulgaria, Hungary, Poland, Rumania and Czechoslovakia.

China.—*Nationalist.*—The military advisory group from the U.S. was doubled in size to speed the training of nationalist troops on Formosa. The army on Formosa totalled approximately 300,000 combat troops, with approximately the same number of troops in service units and headquarters.

Communist.—The Chinese Communist army numbered ap-

"IN STEP," a cartoon by Fischetti of the NEA Service, Inc., published in 1952

CENTURION MEDIUM TANKS firing tracer ammunition during night practice at Hühne in the British sector of Germany during 1952. The tracks on the film show the simultaneous firing of the shells and their trajectory

approximately 2,800,000 active troops, plus an estimated 2,000,000 reserve and garrisoned forces. The combat forces were grouped in four to six field armies containing between 75 and 100 divisions each. Of these troops approximately 900,000 were in Korea. There were only five artillery divisions with heavy artillery, and three armoured divisions with approximately 500 tanks, probably Soviet T-34s.

Very extensive training was being conducted in the military academy at Peking, as well as the artillery schools at Peking and Paoting, and armoured schools at Fengtai, Süchow, Nanking and Erumtsi.

Increased emphasis during the year was placed on modernizing the army and revising its tactics and training in order to provide increased firepower. Special artillery and armoured force commands were organized. Unconfirmed reports indicated the establishment of tank repair factories.

Reports indicated that the Chinese Communists planned to supplement the 18th division in Tibet with additional troops in order to dominate the Himalayan area.

The headquarters of the 4th field army, previously at Hanow, had been shifted to Canton. This shift took the army headquarters closer to the southeast coastal defenses.

According to an article written by Gen. Hsio Hua of the political department of the military council, "the Soviet army of today will be the model of the People's Liberation Army of tomorrow." The premier announced that Communist China had organized an armed militia of 12,000,000 men to act as reserve forces for the regular field armies.

France.—The French omnibus military appropriations bill totalled \$3,700,000,000, a record-high defense budget accounting for 33% of French government spending for 1952. The budget was an increase of 71% above that for 1951. It would make available to the North Atlantic Treaty Organization forces by 1953, eight combat-ready divisions with four additional divisions

ready for immediate mobilization. France expected \$625,000,000 worth of offshore contracts from the U.S. for its armament industry. The actual amount received was \$185,000,000, creating serious budgetary difficulties. There were reports that France would request additional British and U.S. troops to be sent to Europe in 1953 to make up for deficiencies that the French armament program could not meet.

European Defense Community.—One of the major problems facing France during the year was the ratification of the treaty on the European Defense Community. There was considerable objection in France to the treaty on the basis that it did not contain sufficient guarantees against the dangers of a rearmed Germany. (See also EUROPEAN UNION.)

The War in Indochina.—At the beginning of the year the Vietnam army consisted of approximately 60,000 regular troops with a similar number of auxiliary troops. This army relied largely on French officers, with approximately 3,750 serving in the Vietnam army formations. The major operational units were 35 battalions supplied with light arms from U.S. military equipment. There was no general staff and the Vietnam officers, totalling approximately 1,000, had only 4 colonels and 76 majors. The National Military academy produced 200 lieutenants every nine months. During the year the first regimental combat team was formed under Gen. Nguyen van Hinh, the first commanding general of the Vietnam army. The French shifted the command of the Vietnamese army to General Nguyen, and assigned the independent Vietnamese force to occupy captured areas and mop up guerrilla resistance. The Vietnamese forces concentrated on the development of armour, artillery, engineering and other specialized units.

The total number of troops in the anti-Communist armies in Indochina was approximately 300,000. Of these more than 55,000 were French. Another 130,000 were French Union troops (Moroccans, Algerians, Senegalese and Foreign Legion). Another 100,000 were Vietnamese.

The Viet-Minh forces numbered approximately 400,000 al-

though a large number of these were irregulars. There was an attrition of Viet-Minh strength during the early months of the year as a result of heavy fighting in the Tonkin war theatre. In this battle zone Viet-Minh regulars were well armed with basic infantry weapons but lacked heavy weapons, armoured vehicles and transport and had no air support. By the start of the rainy season in June, the French and allied forces had to a large degree driven the Viet-Minh forces from the Red river delta. From Nov. 1, 1951, to May 30, 1952, the French counted 16,756 Viet-Minh dead and had taken 9,801 prisoners. French estimates put total Viet-Minh casualties at more than 50,000.

In October the Viet-Minh launched new attacks directed at recapturing lost territory in the Red river delta. The initial attacks succeeded in capturing several outposts from the French in the area of Hanoi. The French estimated that the Viet-Minh had been able to rebuild two or three divisions during the rainy season.

There was increasing evidence during the year of additional Communist Chinese military advisers and technicians supporting the Viet-Minh forces in Indochina. These Chinese forces were estimated to number 10,000.

Great Britain.—The annual defense budget approximated \$3,250,000,000. The conscription term was continued at a two-year period as the regular and reserve forces exceeded 1,250,000. Tank production was accelerated during 1952 with emphasis placed on the manufacture of Centurion tanks which were given a "super priority" rating for production. Guided missiles and anti-mine equipment were also given "super priority" ratings and together with Centurion tanks composed approximately one-sixth of British armament production.

Britain received from the U.S. under the Mutual Security Aid program anti-tank rocket launchers, rocket ammunition, tank transporter tractors and medium and self-propelled guns.

Disposition.—During 1952 approximately 12,000 troops served in Korea, where together with the Australian, Canadian and New Zealand troops they were brigaded into the Commonwealth division. In addition, 22,000 troops served in Malaya and 11,000 in Hong Kong.

Plans to raise two battalions of colonial troops in the West Indies for service anywhere in the Caribbean were announced. These would replace the single Jamaican battalion which was limited to local service.

The strength of the British army reached an effective fighting organization of ten divisions, plus ten reserve divisions.

An agreement was under negotiation with the Japanese to obtain permission to maintain commonwealth troops in Japan after the occupation ended.

Organization.—During the year Gen. Sir John Harding succeeded Field Marshal Sir William Slim as chief of the imperial general staff. General Harding, who commanded the 7th armoured division at El Alamein, was formerly commander of the British army of the Rhine. In that post General Harding was succeeded by Lieut. Gen. Sir Richard Gale, a wartime commander of airborne troops.

Malaya.—Gen. Sir Gerald Templer was sent to Malaya during 1952 to accelerate the campaign against the Communists. The Malayan federation police force was put through an intensified period of training. Plans were drawn up for arming more than 100,000 of the 320,000 home guard. A new conscription law was passed to permit the enlargement of the regular and auxiliary military formations. The regular forces in Malaya consisted of 30,000 troops plus 120,000 police regulars, specialists and auxiliaries. It was estimated that there were approximately 8,500 Communists, most of which were Chinese.

Other Powers.—**Australia.**—In order to make up for the failure of the recruiting campaign, more personnel was recruited in

Great Britain. About 3,000 British former servicemen were recruited for service in the Australian army, and 100 former British army officers were sought to alleviate a 20% shortage of officers.

The first paratroopers trained in Australia were graduated during the year from the School of Land-Air Warfare at Williamstown, N.S.W.

The army took over the training of pilots for reconnaissance, communications and air medical evacuation missions. Light aircraft units were manned with pilots chosen from the army and familiar with the tactical requirements of the ground forces.

Belgium.—A defense budget of \$200,000,000 was passed. The term of conscription was reduced from 24 to 21 mo. by a special act of the cabinet. The reduction in the term of conscription reduced by 15% the effectiveness of the three active divisions.

About 20,000 native troops were being trained in the Belgian Congo for defensive purposes. The troops were led by 356 Belgian officers and 406 noncommissioned officers who had volunteered for five-year terms.

The Luxembourg foreign minister announced plans to integrate the Luxembourg army into the Belgian armed forces.

Denmark.—A defense strength of approximately 225,000 was the goal for 1952, including an army of 100,000, a local defense force of 20,000 and a home defense force of 50,000.

The establishment of a permanent fully trained division was commenced. In order to man the division, conscription was extended from 12 to 18 mo.

Germany, West.—Agreement was reached among the North Atlantic nations on the rearmament of western Germany. Admitting Germany as a full member of the European Defense Community, the western powers provided that a German force would be integrated into the European army. Strength of the force was tentatively set at between 300,000 and 400,000 men, organized into 12 divisions. Restrictions were placed on any German production of atomic weapons, chemical or biological warfare instruments, deep-sea naval vessels, guided missiles or military aircraft. However, the Bonn government would be allowed to manufacture tanks and artillery of all sizes as well as lighter arms. West of the Rhine it would be permitted to manufacture explosives and propellants as well as guided missiles. It was further agreed that Germany should continue to pay the occupation costs of the British, French and U.S. troops for one year following the conclusion of the peace treaty. This amounted to approximately \$2,700,000,000.

The western German government planned to call 60,000 volunteers from the former army as the cadre for the new force as soon as the treaty was ratified. These volunteers would be trained for four to six months during which time the German *bundestag* would be asked to prepare a conscription law for drafting men 19 to 21. The army would consist of eight infantry and four armoured divisions backed by a tactical air force of 1,746 jet fighters. This army would be integrated into the European army which would total in all 43 divisions. (Other contributions to this army would include France 12 divisions, Benelux 5 divisions and Italy 12 divisions. These divisions were slightly smaller than U.S. divisions, consisting of 13,000 men per infantry and 12,600 per armoured or mechanized division. This combat strength would be raised by 2,000 men per division in the event of war.)

In June 30 west German officers commenced working with an interim subcommittee of the European Defense Community. Attention was devoted to personnel and administration, organization and training, communications and logistics.

Germany, East.—During 1952 there was a sharp increase in the funds available to the east German government for construction of military training facilities and barracks. Reorganiza-

ITALIAN ARMY MANOEUVRES, using medium Sherman tanks, in northern Italy in 1952

tion of the *Bereitschaften* (readiness force) into cadre formations capable of rapid expansion into combat divisions was completed. Reports indicated that at least one armoured division was being formed. There were also indications that a number of plants in eastern Germany had been retooled to produce Soviet heavy weapons, indicating the possibility that eastern Germany could arm its own force. Best indications were that the east German force had the potentiality of being organized into 25 divisions, although probably not consisting of more than 100,000 men during 1952.

Greece.—Armed forces totalled approximately 176,000, with a conscription period of three years. However, there were discussions of cutting the conscription to two years because of reduction in U.S. aid. This would reduce the size of the Greek army to approximately 145,000. The Greek army was organized into ten divisions, with shortages in tanks and anti-aircraft artillery.

Preliminary discussions were held on co-operation with Yugoslavia. Discussions between Greek and Yugoslav officers were directed toward reaching an entente in the event of a Soviet or satellite attack.

Italy.—Twelve divisions were to be fully mobilized by the end of 1952 with three additional divisions to be organized in 1953, provided that military equipment was received from the U.S. Italy provided four divisions to the integrated European Army (Mantova, Legnano, Fulgore and Cremona), plus one armoured brigade (Ariete) and two Alpine brigades (Julia and Tridentina). In addition the Friuli and Granatieri infantry divisions and the Triestina, Avellino, Aosta and Pinerolo divisions were to be fully organized and trained and held in reserve. A second armoured division, the Centauro, and a third Alpine brigade, the Taurinense, were to be organized. Italy had received more than 800 tanks plus artillery, electronic equipment and anti-tank and anti-aircraft equipment.

During 1952, \$822,000,000 or 24.1% of the budget was earmarked for defense, an increase in the defense appropriation of approximately one-fifth.

During March 1952, the first joint exercises of the southern European forces were held near the Italian-Yugoslav frontier around Udine. These exercises were directed by Italian Gen. Maurizio Lazarro de Casiglioni, commander of the Allied land forces in southern Europe. The command involved included the 2nd Italian army corps, composed of three infantry divisions, two armoured brigades and one Alpine brigade.

Korea (Republic of).—During the year the army's strength was increased to ten divisions plus special units. More and more South Korean units were moved into key positions in the front line until more South Korean troops were holding front-line positions than all foreign troops combined. Shortage of good officers still plagued the South Koreans, although an increasingly large number of officers received training in the U.S., particularly in infantry, armour and engineering.

The Netherlands.—Approximately \$470,000,000 was scheduled for the Netherlands defense expenditure in 1952.

Army plans listed a goal by the end of 1954 of five front-line divisions organized into one corps of three divisions, plus two independent divisions. In addition, communications troops would be organized to defend lines of communication and vulnerable points in the Netherlands.

A request was made to SHAPE to provide U.S., British and French officers to advise in the training of troops. In addition, these liaison officers were to act as staff officers in the headquarters of the corps and two divisions that the Dutch provided for SHAPE. Dutch officers numbering 200 to 300 were sent to the U.S. for intensive training. A total of 60,000 to 70,000 Dutch troops were called to active duty for periods varying from one to three months to serve in the SHAPE manoeuvres.

Norway.—The defense budget for 1952 was a record \$137,200; the largest proportion of the budget was allocated to the army which was to be expanded to a total of 11 brigades by 1955. The standing peacetime defense establishment consisted of two divisions of reduced strength. This was supplemented by the home guard. The principal difficulty facing Norway was the development of a corps of officers and noncommissioned ranks sufficient to lead the army of expanded size.

Poland.—Reports indicated that an efficient and well-equipped Polish army of 500,000 had been developed by Marshal Konstantin Rokossovsky. The army consisted of 22 divisions, including 4 armoured and 4 motorized equipped with Soviet heavy tanks. In addition to the army, there was a fully armed security corps numbering 60,000 and a frontier defense corps of 40,000.

Sweden.—Principal developments included re-equipping the army with modern weapons and increasing the firepower of the artillery. Major developments also included acceleration of the program to place major defense industries, aircraft installations, army barracks and hospitals underground.

Switzerland.—Although the permanent regular ground force numbered only approximately 500 men, all commissioned or non-commissioned officers, an army of 600,000 could be placed in the field within 48 hr. This consisted of 4 corps, composed of 9 infantry divisions, 3 motorized brigades and 24 squadrons of cavalry, plus fortress troops. Approximately 25% of the national budget was allocated to defense. All small arms were produced in Switzerland, with motor transport and tanks purchased from the U.S. or Great Britain. During the year a proposal to increase rearmament by \$345,000,000 was defeated by popular vote.

Turkey.—Turkey's advent to the North Atlantic Treaty organization together with Greece was one of the important developments of the year. Headquarters of the Turkish-Greek forces in NATO were opened at Izmir.

U.S. military advisers were attached to each corps, division and separate brigade of the Turkish army. These teams consisted of advisers on infantry, artillery, administration, engineer, signal and ordnance. Strength of the Turkish army was approximately 400,000 men maintained by universal military training, with compulsory service for two years at the age of 20.

Yugoslavia.—The defense appropriation amounted to 22% of the national income or approximately \$666,000,000.

A military agreement was reached between Yugoslavia and the U.S. during 1952 providing for the latter to supply tanks and heavy artillery to the Yugoslav army. This agreement followed an inspection tour of Yugoslav installations by a U.S. military mission. In addition, U.S. supplies of transportation and signal equipment and light weapons continued and a study was made of financing orders for military equipment in Yugoslavia to contribute to the expansion of the armament industry. Aid was received from Great Britain and France as well as from the U.S. (See also ATOMIC ENERGY; AVIATION, MILITARY; NAVIES OF THE WORLD.) (L. B. K.)

Art Exhibitions. An exhibition not only of great interest but superb in quality was "Two Thousand Years of Tapestry Weaving," from Egyptian and Graeco-Roman times to the present, put on at the Wadsworth Atheneum in Hartford, Conn. Adèle Weibel, curator emeritus of textiles of the Detroit Institute of Arts, organized the exhibition. Among the 182 items was one of the famous Vie Seignuriale tapestries lent by the Musée de Cluny in Paris and a Goya Caprice tapestry lent from Madrid.

The Art Institute of Chicago and the Metropolitan museum, New York city, organized jointly an impressive exhibition of paintings, water colours and drawings by Paul Cézanne (1839-1906). Important pictures were borrowed from Europe, including the famous "Blue Vase" from the Louvre in Paris, and the finest from American collections, notable among which were the "Card Players" and the portrait of Mme. Cézanne, both belonging to Stephen Clark.

A retrospective exhibition of the work of the American artist John Sloan was held at the Whitney Museum of American Art, New York city. This turned out to be a memorial show, as the artist died in 1951 during the course of arrangements. His best-known painting, "McSorley's Bar," was featured.

In Boston the Institute of Contemporary Art held a retrospective exhibition of the noted Expressionist painter Wassily Kandinsky (1866-1944). Many pictures were borrowed from the artist's widow in Paris. He was a leader in the modern abstract movement after 1910. The institute also held an exhibition honouring Walter Gropius, pioneer modern architect who founded the Weimar-Dessau Bauhaus, modern design centre in Germany.

Philadelphia's University museum, devoted to anthropology, invited seven nonanthropologist experts to select an exhibition from among their 500,000 objects in storage. A varied and interesting group of primitive African, South Sea Island, pre-Columbian Mexican and other objects were chosen by Franklin Watkins, painter; Jacques Lipchitz, sculptor; Norman Bel Geddes, designer; Charles Addams, cartoonist; Louis Stern, collector; René d'Harnoncourt of the Museum of Modern Art; and Lincoln Kirstein, head of the New York City ballet.

An extravagant contemporary exhibition, the Terry National Art exhibit, was put on at the Dinner Key auditorium in Miami, Fla., at a cost of \$85,000. The highest awards in history, \$13,000, were given out. Artists from 47 states were repre-

sented. Top prizes were \$5,000 to Philip Evergood for "Happy Entrance," \$3,000 to Ellis Wilson for "Fisherwoman," \$1,500 to Antonio P. Martino for "Winter" and \$1,200 to Francis Chapin for "Family Affair."

In Los Angeles, Calif., the County museum staged 4,000 years of Chinese ceramics from the third millennium B.C. to Emperor Ch'ien Lung (died 1799). This included the sturdy pieces dating from the dawn of history on through the perfection of Tang, Sung and Ming types to the more elaborate pieces of the 18th century.

Italy invited four artists from the United States to be featured at the Biennale in Venice, It. These were the painters Edward Hopper, Yasuo Kuniyoshi and Stuart Davis, and Alexander Calder, the originator of mobile sculpture. Calder was greatly admired and won the President's prize for a foreign sculptor.

In 1938 Mrs. Simon Guggenheim gave the Museum of Modern Art a sum of money with no restrictions except for the fact that it was to be used only for works of art of supreme importance. An exhibition of these purchases consisting of 13 paintings and 4 pieces of sculpture made a formidable array. Included were Henri Rousseau's "Sleeping Gypsy," Pablo Picasso's "Girl before a Mirror," Fernand Léger's "Three Women," Picasso's "Three Musicians" and Amedeo Modigliani's "Stone Caryatid."

James Johnson Sweeney organized for the Musée de l'Art Moderne in Paris an exhibition called "Masterpieces of the Twentieth Century," assembled from U.S. collections, which were later shown at the Tate gallery in London. Most of the show was made up of important contemporary French pictures. One of the best, Auguste Renoir's large "Nude," lent by the Art Institute of Chicago, Ill., was slashed out of its frame at night by a vandal who was apprehended.

The Albright gallery in Buffalo, N.Y., did an exhibition of Expressionism. Included were Vincent Van Gogh, Paul Gauguin, Edvard Munch and James Ensor, the fathers of Expressionism, as well as the later German group of Franz Marc, Wassily Kandinsky and Emil Nolde; French artists such as Chaim Soutine; and contemporary Americans such as Jack Levine and Hyman Bloom.

The magazine *Art News* again sponsored a National Amateur Painters competition. People from all over the U.S. sent in 1,287 pictures to be juried by H. Harvard Aronson, chairman of the department of art at the University of Minnesota, Minneapolis; Albert Dorne, illustrator; Amédée Ozenfant, painter and teacher; Emily Genauer, art critic of the *New York Herald Tribune*; Richard Pratt, associate editor of the *Ladies Home Journal*; Kurt Seligmann, painter; and Alfred M. Frankfurter, editor of the *Art News*. The gold medal for oil went to Sophy P. Regensburg, housewife, for "Chinese Tureen"; gold medal in water colour to Arnold T. Goldwater, dentist, for "Verdi Square."

In Philadelphia the Pennsylvania Academy of the Fine Arts held its 147th annual, oldest in the country. The exhibition was half-invited and half-juried. Louis Guglielmi won the coveted Temple medal for "New York 21" and Joseph de Martini the Sesnan medal for "Aqueduct." The Beck portrait medal went to Gladys Rockmore Davis for "Study of an Old Woman."

The second oldest annual was the National Academy of Design's 127th, made up of 300 items; two-thirds were by members (jury free). The sum of \$8,500 was distributed in prizes of which Carl Gaertner and Marion Greenwood each took \$1,200 for oils.

Cincinnati held its third biennial of contemporary colour lithography and showed 406 prints from 18 countries.

The Society for Contemporary American Art held its 12th annual exhibition at the Art Institute of Chicago. From the exhibi-

dition the institute was permitted to select \$1,500 worth of pictures or sculpture. This time the selections were a bronze by David Smith entitled "Beach Scene" and Hans Hofmann's oil, "Blue Rhythm."

New York's Museum of Modern Art showed "Fifteen American Painters and Sculptors" in a much discussed group, mostly *vant-garde* but mostly well known. Included were Mark Rothko, Jackson Pollock, Bradley Walker Tomlin, William Baziotes, Joseph Glasco and Herbert Katzman, as well as the sculptors Herbert Ferber and Richard Lippold and the lately recognized older painter Edwin Dickinson.

The National Gallery of Art in Washington, D.C., showed the collection of 19th- and 20th-century French paintings belonging to the famous dress designer Edward Molyneux of Paris.

As the third in its cycle of American exhibitions, the Metropolitan museum assembled a large exhibition of contemporary water colours and drawings. Oils were shown in 1950 and sculpture in 1951.

(F. A. Sw.)

Great Britain and Europe.—The most striking exhibition of the year was undoubtedly the magnificent display of mediaeval art treasures from Italy held at the Petit Palais, Paris. Its scope ranged from the middle of the 3rd century to about 1350. Italian art at this period has often been considered as little more than a mixture of Roman and Byzantine styles, or, in the later period, as a pale counterpart, even an offspring of the more glorious French tradition. Many of the paintings shown in the exhibition were in the international Gothic spirit, though Giotto and Duccio, to say the least, made their own revolutionary contribution. The most powerful effect, however, was formed by the impressive sculpture of Nicola and Giovanni Pisano and Cimmino di Camaino, which convincingly demonstrated the continuity of the classical spirit in Italian art even before it had been officially recognized in the Renaissance.

At Bordeaux and subsequently at Genoa and Barcelona the attempt was made to suggest the community of spirit shared by painters working in Italy, Spain and France during the 15th and 16th centuries. Certain formulas were shared by many of the artists represented, though the indifferent examples of Bartholomé Bermejo's work, the exclusion of the Master of Aix, and the restriction of Antonello da Messina to only one picture lessened the contribution of the major men, and tended to suggest a level of common mediocrity.

These examinations of the cross currents of European art provided a fitting introduction to the magnificent Leonardo exhibitions held in London, at the Louvre, Paris, at Amboise and at Florence to commemorate the 500th anniversary of the great Florentine's birth. The notable exhibition held at Burlington house, London, presented the finest group of the master's drawings (many of which came from the royal library at Windsor) ever to have been held. Every facet of his genius was represented, including a whole series of sketches for paintings such as the Uffizi "Epiphany," the "Leda," "The Last Supper," the "Battle of Anghiari" and the "Madonna with St. Anne," as well as for the Sforza and Trivulzio equestrian monuments. The landscape drawings included the Deluge series. None of the master's masterpieces were shown, only copies and related pictures.

One of the most suggestive shows of the year was devoted to Mannerism and the School of Fontainebleau at Naples. An uneasy compromise was reached between an attempt to illustrate the specific theme and to survey Mannerism as an Italian movement with international ramifications. Few first-rate pictures were included. Much of importance for the European affiliations of Mannerism were provided, which was stressed with great skill in the large-scale exhibition of German art from Dürer's death to the Thirty Years' War.

ILLUSTRATING the techniques by which replicas were made of the early Christian mosaic murals of Ravenna, It., exhibited in England in 1952. Skilled copyists even worked from plaster casts to reproduce uneven surfaces and the reflection of light from slightly different angles

The spread of Italian influence at a later date was the theme of the exhibition devoted to "Caravaggio and the Netherlands," held at Utrecht, Neth., and Antwerp, Belg. The examination of the early Vermeer and Hendrick ter Brugge failed to prove any substantial connection with Caravaggio. His impact on the Netherlands would have become clearer if the choice of items had been sharper. The more regular channel of Dutch art was examined in the fine exhibition, "Three Centuries of Portrait Painting," staged at the Rijksmuseum, Amsterdam, Neth.

The major exhibition of French 19th-century art to appear in England was devoted to Delacroix (at Wildenstein's, London). A number of paintings illustrated stressed his acquaintance with English art, as well as his dependence on the Venetians and Rubens.

Besançon, Fr., appropriately celebrated Gustave Courbet with a group of 60 pictures, among which were some important figure paintings. The custom of regional museums honouring the distinguished sons of their localities was followed at Le Havre, where Louis Boudin was justly celebrated. On a larger scale was the selection from Claude Monet's *oeuvre* which visited Zurich, Paris and The Hague. (See also ART SALES; ETCHING; MUSEUMS; PAINTING; SCULPTURE.)

Art Sales. The Parke-Bernet galleries of New York conducted 91 sales during their 1951-52 season with a total of \$5,727,759. This was a gain of \$180,000 over the previous season. Of the total, paintings, drawings and prints accounted for \$905,700, books and autographs brought the even larger amount of \$1,018,299, while furniture, objects of art, jewellery and personal effects aggregated \$3,803,760.

Attendance was larger than ever at auctions with many new buyers and an increase in mail-order bidding. There were also numerous purchases in Europe and South America.

The Plaza galleries announced an all-time high of \$1,936,441 for the season. There were no single collections of outstanding importance at either auction house and no one painting going for a sensational price. It was a season built on the aggregation of a large number of smaller sales.

At the Parke-Bernet galleries the H. Sylvia A. H. G. Wilks collection of diamond jewellery brought \$389,835, the notable Lincoln collection of Oliver R. Barrett sold for \$273,632 and furniture and silver from the William Randolph Hearst collection brought \$172,455. A collection of arms and armour from Edward Hubbard Litchfield fetched \$97,800, property of Mrs. Henry Ford brought \$172,117 and that of Bernon S. Prentice \$171,277.

Top price for a painting was \$17,500 for Jean-Baptiste Corot's (1796-1875) "L'Odalisque Sicilienne" and next was \$18,000 for Thomas Hicks's portrait of Lincoln (the first oil portrait done of him). Other prices were \$15,500 for Francesco Guardi's (1712-1793) "Landscape with Ruins"; \$13,500 for Vincent Van Gogh's "Peasant Walking Along the Fields"; \$12,000 for the Steigerwalt-Parker-Hart portrait of George Washington by Gilbert Stuart; \$12,000 for Sir Henry Raeburn's (1756-1823) "Boy with Cherries"; \$6,000 for Antonio Pollaiuolo's famous engraving, "Battle of the Nudes" (Italian, 15th century).

Far more spectacular prices were paid at the Cognac sale at the Galerie Charpentier in Paris. Paul Cézanne's "Apples and Biscuits," 1880-82, brought \$110,031; Pierre Auguste Renoir's "Young Girl with Flowers in Her Hat," 1880, went for \$75,021; Cézanne's "Trees and Houses," \$66,686; Renoir's "The Two Sisters," \$63,351; and Van Gogh's "The Thistles," \$55,015. This was an all-time high for modern paintings at auction.

In London the two leading auction houses had a busy season. Christie's conducted the sale of John Constable's (1776-1837) "Salisbury Cathedral" (one of several versions) for Mrs. Allen-Morehouse and knocked it down at the considerable price of £21,525. Col. Oliver Probert sold a pen and ink and sepia wash drawing, "View on the Rhine" by Pieter Bruegel the Elder (1525-69) for £6,510. The Earl of Shaftesbury received £1,627 for a George II commode and £945 for a Chippendale armchair. A Queen Anne bureau, property of Ford Skull, went for £945. On May 7 Christie sold 156 lots of silver for £10,149, top price being £1,800 for a silver gilded teapot by Isaac Ribouleau, 1724. A George III supper set, 1766, brought £720; a bullet-shaped teapot, 1721, £350; a basin on spreading feet by Francis Garthorne, 1691, went for £230; and 17 George III dinner plates, 1785, £320.

Sotheby conducted a group of equally diverse and interesting sales. Count Alfred Potocki's "L'Homme à l'Épée" by Jean-Honoré Fragonard (1732-1806) brought £7,500 and a Meyndert Hobbema (1638-1709), "Village Amongst Trees" (anonymous sale), went for £2,800. A pair of allegorical scenes by François Boucher (1703-1770) sold for £3,000. A 47-piece Barr, Flight

and Barr Worcester porcelain crested dessert service brought £1,500; a Chelsea red anchor tureen in asparagus form brought £610. Numerous Chinese objects came up in sales, important among which were a Ming dynasty green jade water buffalo, £1,350, and a jade horse, £980. Lord Cunliffe's Chinese ceramic and bronze collection totalled £6,994, the highest single item being £1,200 paid for an Imperial dark green horse of the Emperor Ch'ien Lung period, 1789. A Meissen porcelain group of swans mounted on Louis XVI ormolu base brought £1,650. (F. A. Sw.)

Asgeirsson, Asgeir (1894-), president of Iceland. was born at Koranes, Ice., May 13. After graduating in theology at the University of Iceland in 1915, he was appointed teacher at the Teachers' college in Reykjavik (1918-26). He was politically active in the Social Democratic party, was elected to the *althing* in 1923 and was afterward constantly re-elected; in 1930-31 he was president of the *althing*. He was director of education from 1925 to 1931, minister of finance from 1931 to 1934 and prime minister from 1932 to 1934; in 1934-38 he was again director of education. During 1938-52 he served as director of the Fisheries Bank of Iceland. On June 29, 1952, Asgeirsson was elected president of Iceland.

Astronomy. The eighth general assembly of the International Astronomical union (the second since World War II, was held in Rome, It., Sept. 4-13, 1952. It was attended by more than 400 delegates representing 35 countries. Resolutions were adopted concerning the making of observations and publication of the results in many branches of astronomy, particularly those in which planned international co-operation had become indispensable. Astronomers reviewed much of the work of recent years and, as a result, were enabled more effectively to arrange their programs of future work.

Sun.—A total eclipse of the sun, visible along a track from the South Atlantic to Siberia, crossing Africa and Iran on the way, occurred on Feb. 25, 1952. Parties of observers from a number of countries established themselves at various places on the track, the majority in the vicinity of Khartoum (Sudan). The corona was seen to be generally of the form characteristic of minimum solar activity, but other well-developed coronal streamers showed some unusual features. Only preliminary reports upon most of the observations became available during the year. Some of the measurements of the more orthodox kinds, such as those made by the Utrecht astronomers of the variation with height in the chromosphere of the intensities of spectral lines of various elements, were so successful that they were expected to become the standard results for the problems concerned.

Interstellar Matter.—In 1949 W. A. Hiltner had discovered that the light from some stars is partially polarized. It had become generally accepted that this effect is produced in the passage of the light through interstellar "dust," elongated particles of which are for some reason aligned parallel to a

particular direction. Considerable theoretical investigations had been made as to the possibility of such alignment being the result of the existence of interstellar magnetic fields and of suitable magnetic properties of the particles. In 1952, T. Gold published a much simpler suggestion depending on dynamical effects. He showed that when a cloud of elongated dust particles collides with a gas cloud, a partial alignment of the particles is produced, in the direction of the relative motion. The conditions assumed were those believed to exist in interstellar matter and the result appeared to be adequate to account for all features of the observed polarization effects.

Most astronomers had accepted the identification (1942) by W. Baade and R. Minkowski of the Crab nebula as the visible remains from a supernova outburst in the year 1054. However, it had been difficult to explain why the nebula was still shining, there being apparently no associated star capable of illuminating it. W. H. Ramsey made the fruitful suggestion that the presence of sulphur and nitrogen, whose lines are a prominent and unusual feature in the spectrum, is the result of the radioactive decay of certain isotopes of chlorine and carbon. This decay could release energy at a rate sufficient to account for the observed luminosity. Moreover, these isotopes would be a likely product of the processes occurring in a supernova explosion according to a theory previously given by F. Hoyle.

Galaxy.—Two new methods of studying the structure of the Galaxy confirmed each other in making outstanding progress in the subject. It was known that the brightest (O- and B- type) stars render luminous some patches of interstellar hydrogen in their neighbourhoods. Also it had been noted that such patches of luminous hydrogen in the Andromeda nebula, to which the Galaxy was considered to be similar, are concentrated in the spiral arms. By very careful measurements, W. W. Morgan succeeded in determining the distances of some of the O- and B- stars and the associated hydrogen emission regions in the Galaxy. He found that these enabled him to trace out portions of the spiral structure; his results were greatly in advance of anything previously known of this structure. But it had been verified that, as theoretically predicted, interstellar hydrogen emits radiation of 21 cm. wavelength detectable by radio observations. (This emission does not depend upon excitation by any stars immersed in the hydrogen gas.) In 1952 a general survey of the characteristics of such radiation coming from various directions in the Galaxy was made by C. A. Muller, H. C. van de Hulst and J. H. Oort of Leiden, and the first results were reported by Oort in Rome. They found that the Doppler frequency-shift, varying with distance from the sun and produced by the known rotation of the Galaxy, enabled them to study the space distribution of the emitting gas. The main regions of maximum density in the gas were found in fact to define three spiral arms in our Galaxy. Moreover, these were in excellent agreement with Morgan's results for the parts of the arms revealed by his quite independent method, thus confirming the interpretation placed upon the radio observations. These two investigations furnished much the most direct evidence hitherto obtained that the Galaxy is actually a "spiral nebula" as well as the most extensive information to date about its particular configuration. Also our own Galaxy thus became the first for which the spiral configuration could be quite reliably related to the sense of rotation: the spiral arms were found to be "trailing."

Radio Astronomy.—Renewed efforts were made to identify "radio stars" with otherwise detectable astronomical objects. Two remarkable provisional identifications were made by W. Baade, one with a hitherto undetected nebulosity within the Galaxy which had the appearance of being the remains of a supernova outburst (this being in agreement with the character

TOTAL ECLIPSE of the sun by the moon on Feb. 25, 1952, photographed near Khartoum in the Anglo-Egyptian Sudan

of one or two cases for which identification had already been made), and one with a pair of external galaxies which appeared to be in course of a "flat-on" collision. Though the physical mechanism of the production of radio noise in general had still eluded discovery, T. Gold pointed out that these identifications offered fresh evidence that the mechanism is in general associated with the existence of bodies of gas meeting each other with high relative speeds. (See also NATIONAL GEOGRAPHIC SOCIETY.)

Atomic Energy. The number of nations known to possess atomic weapons was increased to three when Great Britain exploded its first atomic bomb at 8 A.M. on Oct. 3, 1952 (Australian time), in the Monte Bello Islands, 50 mi. N.W. of the coast of Australia. According to the best available unofficial count, it was the 36th nuclear explosion in the history of the world. The United States had previously staged 32, and the U.S.S.R. 3.

British possession of the bomb was expected to have a marked effect upon the international atomic armament race, the tempo of which continued to mount in 1952.

The United States embarked upon a vast expansion of its atomic energy facilities in 1952. A series of eight tactical bombs were detonated in Nevada in the spring of the year. At the time of the British explosion, a U.S. task force was on Eniwetok atoll, preparing for additional tests to be held before the end of the year.

Soviet activities were hidden behind the "iron curtain," but there were reports that the U.S.S.R. was pushing its atomic program with feverish intensity.

Other events of importance in the realm of atomic energy during 1952 included the death of U.S. Senator Brien McMahon, chairman of the joint congressional committee on atomic energy; the failure of the new United Nations Disarmament commission to make any progress toward the international control of atomic

energy; the formation of the European Council for Nuclear Research; the laying of the keel of the first atomic-powered submarine; the completion of the cosmotron at the Brookhaven National laboratory, Upton, N.Y., the first atom-smasher to achieve energies measured in billions of electron volts; and the discovery of new sources of uranium ores in Canada and southern Australia.

The British Bomb.—Prime Minister Winston Churchill revealed that Britain's first atomic bomb had been detonated inside the 1,450-ton frigate "Plym," a World War II escort ship, riding at anchor in the Monte Bello Islands. The ship was vaporized except for some red-hot fragments which were sprayed over one of the islands, starting fires in the vegetation.

"Thousands of tons of water and of mud and rock from the sea bottom were thrown many thousands of feet into the air and a tidal wave was caused," Churchill told the house of commons. He explained that the test had been designed to disclose the effects of an atomic bomb on a harbour.

Newspapermen watched the explosion from a hilltop on the Australian coast, about 65 mi. from the centre of the test area. The bomb exploded with the usual bright flash, followed by the appearance of the familiar ball of fire. However, the cloud that formed after the explosion differed greatly from the mushroom formation usually associated with the atomic bomb. It was a ragged billowing cloud, shaped like a distorted Z, 1 mi. wide and 2 mi. high.

The hilltop observers experienced a sharp atmospheric shock wave about four minutes after the flash. The noise was a sharp crack followed by a prolonged roll like thunder.

The project was under the command of Rear Adm. Arthur D. Torlesse. The civilian scientific director was William George Penney, chief superintendent of the armament research unit of the ministry of supply. Penney was knighted on Oct. 23.

The royal air force announced on Oct. 23 that the nation had embarked upon the production of other atomic bombs and the necessary aircraft to deliver them. It was stated that all future bombers would be able to carry A bombs.

The British Atomic Establishment.—It was estimated that Great Britain had spent £200,000,000 (\$560,000,000) on the development of its atomic energy establishment. Speaking in the house of commons on Feb. 26, 1952, Prime Minister Churchill said, "I was not aware until I took office that not only had the Socialist government made the atomic bomb as a matter of research, but that they had created at the expense of many scores of millions of pounds the important plant necessary for its regular production."

The British Atomic Energy act adopted by the house of commons on Nov. 6, 1946, is comparable in many ways to the U.S. Atomic Energy act adopted in the same year by congress. However, instead of creating a commission, it lodges control of atomic energy activities in the ministry of supply.

Under the direction of the ministry of supply, the project is divided into two branches. The research branch is the British Atomic Energy Research establishment at Harwell, Berk. The production branch is the Department of Atomic Energy at Risely, Lancs. Associated with the Harwell establishment is the Radiochemical centre at Amersham. The department at Risely is charged with the operation of the uranium piles or nuclear reactors at Sellafield, Cumb. In 1952 Britain was believed to have at least two reactors for the production of plutonium. There was a uranium ingot plant at Springfield, Lancs. In addition, there were "top secret" installations at Capenhurst, Ches., and Aldermaston, Berks.

The Harwell establishment includes two nuclear reactors, a "hot" laboratory, that is, a laboratory specially designed for working safely with radioactive materials, and various atom-

smashing machines including the largest synchro-cyclotron operating in Europe, an electron synchrotron, and a linear accelerator. One of the reactors produces radioactive isotopes for the use of hospitals, universities and industrial laboratories.

Late in 1952 the Harwell scientists were working on the design of three new reactors—a slow-neutron enriched-uranium reactor, designed as a prototype power unit for ship propulsion; a slow-neutron natural-uranium reactor to develop power for the production of electricity; a fast-neutron reactor of the "breeder" type, designed to develop useful power and at the same time to produce more plutonium than the uranium ²³⁵ it consumes. The breeder reactor was to have a small core, perhaps only two feet in diameter. This would be mounted in a pressure chamber where a gas under pressure, probably helium, would conduct the heat to a water boiler for the generation of steam.

Sir John Cockcroft, who shared the 1951 Nobel prize in physics with E. T. S. Walton for pioneer experiments in atom-smashing, was director of the Harwell establishment.

At the head of the British atomic program was Lord Cherwell, formerly professor of experimental philosophy at Oxford university, whom Churchill appointed to his cabinet as his chief adviser on atomic energy.

U.S.-British Co-operation.—It was expected that the successful explosion of the first British atomic bomb would lead to closer co-operation between the United States and Great Britain in the realm of atomic weapons.

Both Britain and Canada sent scientific missions to the United States during World War II to work on the development of the first atomic bomb. However, only U.S. scientists worked on certain aspects of the final stage.

The U.S. Atomic Energy act of 1946 banned the exchange of information relating to the bomb, and Great Britain was unable to obtain information which it wanted in the postwar years. Negotiations begun in July 1949 were upset in 1950 when the treachery of Klaus Fuchs became known. Fuchs had come to the U.S. as part of the British scientific group.

While in Washington in Jan. 1952, Prime Minister Churchill reopened the subject with Pres. Harry S. Truman and subsequently it was discussed by Lord Cherwell, Churchill's adviser on atomic energy, with members of the U.S. Atomic Energy commission. Both General of the Army Omar N. Bradley, chairman of the Joint Chiefs of Staff, and Gen. J. Lawton Collins, army chief of staff, had expressed the belief that it was in the interests of the United States to inform its allies of the capabilities and use of atomic weapons. United States scientists believed that it was possible that Britain might be ahead of the United States in some aspects of atomic energy and that both nations would benefit by the complete exchange of information.

U.S. Detonations in 1952.—The United States exploded eight atomic bombs in a series of tests between April 1 and June 5, 1952, at Frenchman's Flat and Yucca Flat, the two test sites maintained by the U.S. Atomic Energy commission in the air force bombing and gunnery range, a 5,000-sq.mi. tract about 75 mi. from Las Vegas, Nev.

It was generally understood that the commission used the Nevada sites for testing tactical weapons while more powerful strategic ones were tried at Eniwetok in the mid-Pacific.

The first bomb in the 1952 Nevada tests was dropped from an aeroplane over Frenchman's Flat on April 1. It was apparent to observers that this was a new variety of atomic explosion. The usual ball of fire, formed at the instant of explosion, was accompanied by a secondary curtain of fire that seemed to consist of a line of parallel, vertical, fiery jets. Observers counted about 20 of these jets, extending half a mile, perhaps, from the fireball. It seemed reasonable to suppose that this was a new weapon designed for some specialized purpose. The com-

Above, left: **FIRST ATOMIC HEATING** plant in the world, during early construction stages at the atomic research establishment in Harwell, Eng. The plant was in its first year of operation in 1952, heating a building of 80 offices

Above, right: **HYDROGEN PLANT** erected for the U.S. Atomic Energy commission along the Savannah river in South Carolina. Photographed from a passing train by a N.Y. journalist, the picture was cleared by the AEC in 1952

Left: **WRECKAGE** of a 2½-ton truck after an atomic bomb was detonated at Yucca Flat, Nev., in May 1952. The area was strewn with equipment to demonstrate the bomb's destructiveness to the 2,100 U.S. marines who took part in the manoeuvre

"ANOTHER BIRD HEARD FROM," a 1952 cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.)

mission offered no explanation.

New behaviour was likewise exhibited by the second bomb, dropped from an aeroplane over Yucca Flat on April 15. The flash usually accompanying the explosion was missing, but the fireball was brighter than usual. However, the ball broke into two taillike structures that joined together a minute later to form a gigantic, pinkish ring. Again, there was no comment from the commission.

The third bomb was dropped from an aeroplane over Yucca Flat on April 22, and exploded at an altitude between 3,000 and 3,500 ft. Gordon Dean, chairman of the commission stated that it was the most powerful bomb yet exploded within the boundaries of the United States and more powerful than those that devastated Hiroshima or Nagasaki, Jap.

A battalion combat team of about 2,100 troops carried out manoeuvres in connection with this explosion. U.S. troops had taken part in such a manoeuvre for the first time on Nov. 1, 1951.

At the April 22 explosion, the troops and their officers, including three generals, were huddled in deep foxholes and trenches about four miles from "ground zero," the point directly underneath the exploding bomb. As soon as the bomb exploded, the soldiers climbed out of their trenches and stood in the open as the shock wave, driving a great cloud of dust before it, swept over them.

Subsequently, when radiological teams had determined that it was safe, they moved into the bombed area. Paratroopers were also dropped into the area from aeroplanes.

The April 22 explosion marked the television debut of the atomic bomb. Television cameras picked up the explosion and the image was relayed to stations from coast to coast, enabling millions of persons to see it. However, the telecast was not too

satisfactory and the television audience saw less than was seen in the motion pictures of the 1946 Bikini bomb tests.

The fourth bomb was dropped from an aeroplane over Yucca Flat on May 1. About 2,150 marine corps troops were crouched in foxholes within three to four miles of "ground zero." This was probably closer to a bomb explosion than any persons had ever been with the exception of the victims in Hiroshima and Nagasaki.

This bomb exploded at an altitude of about 2,000 ft., considerably lower than the third bomb.

The next four atomic explosions were all of devices atop steel towers about 300 ft. high. The dates were May 7 and 25, and June 1 and 5. Troops were again in foxholes for the explosions on May 25 and June 1.

The Hydrogen Bomb.—There were persistent rumours that the tests planned by the U.S. Atomic Energy commission to be held on Eniwetok atoll in the closing months of 1952 would include the explosion of a hydrogen bomb. The commission, of course, made no statement on the subject.

Expansion of U.S. Facilities.—On July 7, 1952, the last day of its session, the 82nd congress appropriated \$2,898,800,000 for further expansion of atomic energy facilities. On Aug. 12, the U.S. Atomic Energy commission announced the first major item in the new program, a plant for the production of uranium 235 to cost \$1,200,000,000. A 6,500-ac. site in Pike county, O., was selected for it.

Progress was made during 1952 on two plants for which funds had been previously provided, the Savannah River plant near Aiken, S.C., for the production of either plutonium or hydrogen isotopes, to cost \$1,250,000,000 and a plant at Paducah, Ky., for the production of uranium 235, to cost \$500,000,000. In addition, the feeds materials production centre at Fernald, O., was partially completed.

In Oct. 1952, it was estimated that 3% of the nation's construction labour force was at work on atomic energy building projects. Atomic installations in operation were consuming about 3% of the nation's production of electric power, an amount equal to that consumed by New York city. Plans were being made for additional electric power facilities for the new plants under construction.

Completion of the expansion program, scheduled for 1958, would quadruple the nation's atomic energy facilities. However, technical improvements and higher efficiency were expected to result in a tenfold increase in the U.S. atomic bomb potential.

New Uranium Sources.—Several of the ore processing plants on the Colorado plateau were enlarged during 1952 as continued exploration extended the producing areas. The search for new uranium deposits was continued with an active program of prospecting and drilling under the joint auspices of the commission and the U.S. geological survey.

New uranium sources were found during the year in Canada and Australia. The first of several plants to recover uranium from the gold ores of the Rand in South Africa was nearing completion.

First Atomic Submarine.—The keel plate of the first atomic-powered submarine, the U.S.S. "Nautilus," was laid at Groton, Conn., on June 14, 1952. The submarine was being built by the Electric Boat company.

The atomic power plant for this submarine was being built by the Westinghouse Electric corporation. A land-based prototype of the reactor to be used in it, developed jointly by Westinghouse and the Argonne National laboratory, Chicago, Ill., was being installed for test purposes in a section of submarine hull at the Reactor Testing station in Arco, Ida.

President Truman disclosed that the "Nautilus" would be able to stay under water indefinitely without the aid of a breathing

ube and that its underwater speed would be 20 knots. While emphasizing the importance of the "Nautilus" as an instrument of war, he hailed it as an even greater forerunner of the peaceful applications of atomic energy.

Construction of a land-based prototype of another type of reactor suitable for use in submarines, the so-called submarine intermediate reactor, was begun by the General Electric Co. at West Milton, N.Y., about 18 mi. north of Schenectady. General Electric was also working on the design of a reactor for the propulsion of aircraft at its plant in Lockland, O.

Atomic Artillery.—The U.S. army disclosed on Sept. 30, 1952, the details of an 85-ton cannon, designed to shoot an 11-in. projectile a distance of 20 mi. The weapon was termed an "all-purpose artillery piece," capable of shooting either conventional or atomic shells, although only conventional shells had been shot from it. The 40-ft. cannon is carried on a flat-bed vehicle moved by two tractors, like a freight train with a locomotive at either end. Hydraulic jacks lift the weapon from its bed and place it into position for firing.

New Reactors.—A number of new nuclear reactors were completed by the U.S. Atomic Energy commission during 1952. The most important of these was the materials testing reactor at the national Reactor Testing station in Arco, Ida. This reactor would be used to make irradiation tests on materials considered promising for new reactors.

Experiments were continuing at Arco, with the first experimental breeder reactor, designed to furnish power and at the same time produce more atomic fuel than it consumes.

The commission made public the technical details of several low-power research reactors, including one at the Oak Ridge laboratory, Oak Ridge, Tenn., known as the "swimming pool reactor" because it is immersed for shielding purposes in a pool of water 20 ft. wide, 20 ft. deep and 40 ft. long.

The Brookhaven Cosmotron.—A synchro-cyclotron known as the cosmotron went into operation at the Brookhaven National laboratory on June 10, 1952, producing a beam of protons with energies of 2,300,000,000 ev, the first time an atom-smasher had exceeded the 1,000,000,000-ev mark. However, it was thought that the discovery at Brookhaven of a new magnetic method of focusing the proton beam might make it possible to build atom-smashers with energies of 100,000,000,000 ev.

Radioactive Isotopes.—Since Aug. 1946, when the U.S. Atomic Energy commission began its program of isotope distribution, about 27,000 shipments of radioactive isotopes had been made to 922 institutions in the United States and more than 1,900 shipments of stable isotopes to 250 institutions. More than 1,400 shipments of radioactive isotopes were made to 34 foreign countries.

International Control.—The United Nations general assembly, after four and a half weeks of debate, adopted a resolution on Jan. 11, 1952, to combine the United Nations Atomic Energy commission and the Commission for Conventional Disarmaments into the United Nations Disarmament commission consisting of representatives of the 11 nations on the Security Council and Canada. The Soviet bloc bitterly opposed the resolution and the vote was 42 in favour, 5 (the Soviet bloc) against, and 7 (Argentina, Burma, Egypt, India, Indonesia, Pakistan and Yemen) abstaining.

The next day, Soviet Foreign Minister Andrei Y. Vishinsky submitted a formal proposal containing two important concessions to the views of the western powers. Whereas the U.S.S.R. had previously insisted that atomic stock piles be destroyed as a prelude to discussion of control, he now proposed that the destruction be simultaneous with the adoption of a control plan. He also said that the U.S.S.R. was prepared to agree to continuous inspection of atomic installations.

Vishinsky's proposals were received coolly by the U.S., Great Britain and France with the suggestion that they be put before the new Disarmament commission. It was felt that Vishinsky was motivated by a desire to recoup the loss that the U.S.S.R. had sustained in the eyes of many of the small nations by opposing the creation of the Disarmament commission.

The new commission held its first meeting in Paris in February. The Soviet Union opposed a suggestion of the U.S., Britain and France that the commission begin by drawing up a plan for a world census of armed forces and weapons. By August it was apparent that the commission was deadlocked.

On Aug. 12, the three western powers suggested that a series of talks be instituted by themselves, the Soviet Union and China in an attempt to break the deadlock. The U.S.S.R. turned down the invitation on Aug. 29.

European Council.—Ten nations united in 1952 to organize the European Council for Nuclear Research. They were France, West Germany, Belgium, the Netherlands, Italy, Switzerland, Denmark, Norway, Sweden and Yugoslavia. At a meeting of the council in Amsterdam in October, it was decided to establish an atomic laboratory on a 940-ac. tract just outside the city of Geneva, Switz. The cost of the laboratory was estimated at \$25,000,000.

It was planned to build a supersynchro-cyclotron for the laboratory along the lines of the cosmotron at the Brookhaven National laboratory in the United States. However, by taking advantage of the recent discovery at Brookhaven of a new way of focusing the proton beam, it was expected that the new machine would attain a beam with energies of 30,000,000,000 ev, making it the most powerful atom-smasher in the world.

The president of the council was Paul Scherrer of Switzerland; the vice-presidents were Francis Perrin of France and Werner Heisenberg of Germany. Edward Amaldi of Italy was secretary. The council program was divided into four sections under the respective leadership of four group directors, C. J. Bakker of the Netherlands, O. Dahl of Norway, L. Kowarski of France and Neils Bohr of Denmark.

French Atomic Activities.—The French Atomic Energy commission was created on Oct. 18, 1945. The high commissioner in 1952 was Francis Perrin, who replaced Frederic Joliot-Curie after the latter's dismissal. The commission has laboratories and plants at Chatillon and during the year was completing a "Center for Nuclear Studies" on the Saclay plateau at Seine-et-Oise.

The first French nuclear reactor, an experimental reactor employing heavy water as a moderator, went into action on Dec. 15, 1948. A large reactor was being built at Saclay. About 1,500 scientists, engineers and technicians were employed in the French atomic effort.

German Atomic Plans.—Werner Heisenberg, Germany's leading atomic physicist, told a scientific meeting in Berlin on Oct. 1, 1952, that the German Federal Republic would undertake the mining of uranium and the construction of a nuclear reactor for nonmilitary purposes once the treaties with the western powers were ratified. Atomic research in Germany had been banned since 1946 by action of the Allied Control council.

Brazil's Atomic Plans.—Adm. Alvaro Alberto, chairman of the Brazilian National Research council, and five of his experts were visitors at Oak Ridge, Tenn., in Feb. 1952. The admiral was Brazil's representative on the United Nations Atomic Energy commission and its chairman in 1946. He disclosed that Brazil planned the construction of an experimental nuclear reactor. Three areas of rich uranium deposits had been located in the inland mining state of Minas Gerais. In July a number of U.S. atomic scientists visited Brazil, including I. I. Rabi of Columbia university and John Marshall and Herbert Anderson of The University of Chicago, Ill.

WOOMERA VILLAGE, residential area of the closely guarded Anglo-Australian guided missile range near Adelaide in southern Australia. More than 3,000 civilians and servicemen lived in the isolated desert community in 1952, the greatest hardships being the wind and intense heat

Appeal of Spies Rejected.—By a vote of 8 to 1, the U.S. supreme court on Oct. 13, 1952, refused to review the cases of Julius and Ethel Rosenberg who had been sentenced to death for their part in the atomic espionage ring, and of Morton Sobell who had been sentenced to serve 30 years in prison. The three had been convicted as members of the ring which conveyed information from Klaus Fuchs, German-born British scientist, and others, to agents of the U.S.S.R. (See also BUDGET, NATIONAL; LAW; PHYSICS; STANDARDS, NATIONAL BUREAU OF; URANIUM.)

Australia, Commonwealth of. A self-governing member of the Commonwealth of Nations, Australia is situated in the southern hemisphere. Areas and populations of the six federated states, Australian Capital Territory and Northern Territory are:

States and Territories	Capital	Area (in sq.mi.)	Population (1947 census)	Population (Dec. 1951 est.)
New South Wales	Sydney	309,432	2,984,838	3,358,760
Victoria	Melbourne	87,884	2,054,701	2,291,354
Queensland	Brisbane	670,500	1,106,415	1,219,606
South Australia	Adelaide	380,070	646,073	729,836
Western Australia	Perth	975,920	502,480	591,602
Tasmania	Hobart	26,215	257,078	307,014
Northern Territory	—	523,620	10,868	15,527
Australian Capital Territory	Canberra	940	16,905	25,036
		2,974,581	7,579,358	8,538,735

In 1947 full-blooded aborigines were estimated at 50,000 and half-castes numbered 27,179. Territories under the administration of the commonwealth but not included in it comprise Papua-New Guinea (*q.v.*), Norfolk Island, the Territory of Ashmore and Cartier Islands and the Australian antarctic territory. Language: English. Religion (1947 census): Anglican 2,957,032; Roman Catholic 1,569,726; Methodist 871,425; Presbyterian 743,540; Baptist 113,527; Lutheran 63,243; other Christian 354,443; Jewish 32,019; other non-Christian 4,543; indefinite and no religion 45,036; no reply 824,824. Chief towns (pop., 1950 est.): Sydney 1,584,830; Melbourne 1,326,400; Brisbane 440,000; Adelaide 430,000; Perth (incl. Freemantle) 309,000; Newcastle 134,580; Hobart 87,120. Governor generals: Sir William McKell and (from Jan. 1, 1953) Field Marshal Sir William Slim; prime minister, Robert Gordon Menzies.

History.—In Feb. 1952 the commonwealth was shocked to hear of the death of King George VI. The journey to Australia of Princess Elizabeth and the Duke of Edinburgh was inter-

rupted by the princess' return to London to be proclaimed queen.

The most notable domestic event in 1952 was the check to inflation. The government action was not popular and it increased what was generally described as a "very marked swing to Labour." It was clear that in Australia inflation was far less unpopular than a probable depression. There was much evidence of public dissatisfaction with the conduct of affairs in Korea and a marked desire for an end to hostilities. It appeared that people in Australia felt that the chances of war had receded, but there was still much concern in the parliaments and the press with Communism and defense.

The height of the postwar inflationary boom was passed at the end of 1951. Australia's postwar history of expansion, rapidly rising incomes and employment (unemployment was rare and of short duration), as well as record immigration and investment, was checked. Unemployment was rising and was considerably more than 50,000 people, but probably a much smaller number of people were out of work for more than a few weeks. Immigration was substantially cut, and the nature of investment, but not its volume, had changed.

The check to the postwar boom was brought about by a fall in the price of wool to about half its record level and by a change in government policy. The fall in wool prices had its usual depressing psychological effect on business, but not nearly so marked as such a fall had always had in the past. This was because there was confidence that "cold war" demands for wool would continue. The change in government policy produced a cut in bank lending in certain fields (although bank loans continued to rise in total), and a change in the incidence of taxation against consumption and in favour of investment. The net result was an increase in private investment as a proportion of total expenditure, a fall in the proportion of personal consumption, of government expenditure on administration, health and repatriation, and a rise in the proportion of expenditure on war and defense. National income rose by less than 5%, but expenditure rose by nearly 25% during the year. This rise in expenditure (without anything like a corresponding rise in income) came about because £A1,239,000,000 was spent on imports, while only £A721,000,000 was obtained for exports. The result was a heavy drain on London funds and a sudden imposition of restrictions on imports, which had a very harmful effect upon British producers and merchants.

Although the proportion of total expenditure made for war and defense rose, and the number of men in the armed services was a record for peacetime, the rate at which these developments were taking place was reduced. This was partly because it was realized that the initial aims would have been inflationary on an already overloaded economy and partly because a policy was decided, in collaboration with the United States and Great

Britain, for Australia to import more of its arms requirements and produce more food and raw materials.

The year opened with a commonwealth finance ministers meeting in London in January, and closed with a commonwealth economic conference in which the pressing issues of financial, commercial and economic policy with which several governments were faced were discussed. Little was achieved in 1952 toward the solution of these issues, but it was certain that a downward pressure on wages and costs would be maintained in an effort to ease sterling-dollar exchange.

The commonwealth parliament settled down during the year to a government majority in both houses and more constructive action was taken than in 1951. The Commonwealth Loan council met in May and the prime minister announced that the government could support a loan program of no more than £A125,000,000, but the state premiers outvoted the commonwealth and adopted £A247,500,000 for the year. The prime minister announced the intention of the government to end uniform taxation and return the function of raising taxes to the states.

An outcome of the agreement between Australia, New Zealand and the United States, negotiated as a result of the Japanese peace treaty, which was ratified by the Australian parliament during the year, was the formation and first meeting of the Pacific (ANZUS) Council of Ministers in Honolulu, T.H., in August.

The 1952-53 commonwealth budget included adjustments and reductions of taxation, particularly on companies, increased expenditure on war and defense and social service benefits. None of the increased expenditure on social services was the result of increases in the rates.

Record employment in industry of 2,643,000 was passed in Nov. 1951 and the trend afterward was downward. Unemployment was not uniform over the commonwealth or throughout industry. However, prices continued to rise with little change in the rate. The commonwealth basic wage reached £A11 4s. a week in July 1952, and average weekly earnings in industry in March were £A13 7s.

The year closed with the hearing of an application to the Commonwealth Arbitration court by employers' organizations for a reduction of £A2 6s. a week in the basic wage, and an increase in the working week to 44 hr.

During the year a further loan of \$50,000,000 was made to Australia by the International Bank for Reconstruction and Development. There were important discoveries and developments of uranium deposits in Australia, and atomic weapons were tested. (See also ATOMIC ENERGY; INTERNATIONAL BANK FOR

RECONSTRUCTION AND DEVELOPMENT.)

(J. F. C.)

Education.—Schools (1950): state 7,969, pupils 869,906, teachers 33,271; private schools 1,835, pupils 281,056, teachers 12,425. Universities 8, students 33,000.

Finance and Banking.—Budget: (1951-52) revenue £A1,002,400,000, expenditure £A903,900,000; (1952-53 est.) revenue £A959,900,000, expenditure £A959,400,000. National debt (Dec. 1951) £A3,183,100,000. Currency circulation (July 1952) £A301,000,000. Gold and balances held abroad (March 1952) £A316,600,000. Bank deposits (July 1952) £A995,000,000. Monetary unit: Australian pound with an exchange rate of £A1.25 to the pound sterling and £A0.45 to the U.S. dollar.

Foreign Trade.—(1951) Imports £A940,800,000; exports £A916,900,000. Main sources of imports (1951): U.K. 48%; U.S. 8%; India 5%. Main destinations of exports: U.K. 33%; U.S. 15%; France 9%. Main imports (1951): machinery and vehicles 27%; piece goods 10%; petroleum and products 9%; textile manufactures 7%. Main exports: wool 65%; wheat 8%; wheat flour 4%; dairy products 3%.

Transport and Communications.—Roads (1947): 515,710 mi. Licensed motor vehicles (Dec. 1951): cars 955,537; commercial vehicles 579,492. Government railways (1950-51): 26,954 mi.; passenger journeys 476,113,000,000; goods carried 41,324,000,000 tons; train miles run 88,676,000,000. Shipping (merchant vessels of 100 gross tons and over, July 1951): 357; total tonnage 557,484. Air transport (1951): internal and overseas miles flown 51,180,000,000; passenger-miles 910,904,000,000; freight, incl. mail, net ton-miles 28,990,000,000. Telephones (1951): 1,182,035. Radio receiving set licences (March 1952): 1,985,111.

Agriculture.—Main crops (metric tons, 1951, except as indicated): wheat 4,392,000; oats 505,000; barley 522,000; maize (1950) 102,000; sugar, raw value, 759,000; potatoes 429,000. Livestock (Oct. 1950-Sept. 1951): sheep 115,556,000; cattle 15,239,000; pigs 1,134,000; horses 999,000. Wool production (clean basis, 1951) 282,000 metric tons. Milk production (1951) 1,012,700,000 gal. Food production (metric tons, 1951): butter 142,800; cheese 42,000; meat 1,003,000, incl. beef and veal 649,000.

Industry.—Manufacturing establishments (1950-51): 43,129; persons employed (incl. working proprietors) 968,232. Fuel and power (1951): coal 17,892,000 metric tons; lignite 7,956,000 metric tons; manufactured gas 10,716,000,000 cu.m.; electricity 10,476,000,000 kw.hr. Raw materials (metric tons, 1951): refined copper 12,700; refined lead 202,800; zinc 78,900; pig iron 1,344,000; steel ingots and castings 1,419,000; gold (1951) 870,000 fine ounces. Manufactured goods (metric tons, 1951): wool yarn 20,600; cement 1,236,300. New dwelling units completed (1950-51), 67,444.

Austria. A republic of central Europe, Austria is bounded north by Germany and Czechoslovakia, east by Hungary, south by Yugoslavia and Italy and west by Switzerland. Area: 32,375 sq.mi. Pop.: (1939 census) 6,652,720; (1951 census) 6,918,959. Language: German 98%, other 2% (mainly Slovene in Carinthia). Religion (1939): Roman Catholic 88.27%, Protestant 5.35%, Jewish 1.26% (.2% in 1945), other 5.12%. Principal towns (pop., 1951 census): Vienna (cap., 1,760,784); Graz (226,271); Linz (185,177); Salzburg (100,096); Innsbruck (94,599); Klagenfurt (62,792). President in 1952, Theodor Koerner; chancellor, Leopold Figl. The Austrian government had jurisdiction throughout Austria, with certain limitations regarding matters over which control was reserved to

"DANCE OF THE TORCH BEARERS," marking the official opening of the 1952 Salzburg Music festival in Austria

quadrupartite decision in the Allied Council for Austria. By Dec. 31, 1952, members of the A.C.A. were: France, Jean Payart; United Kingdom, Sir Harold Caccia; United States, Llewellyn E. Thompson, Jr.; U.S.S.R., Lieut. Gen. V. P. Sviridov.

History.—Two factors continued to dominate the Austrian political scene in 1952: the four-power occupation and the coalition government. There remained little doubt that but for the former the latter would have disintegrated. Characteristic of the strain between the two coalition partners, the People's party and the Socialist party, was the dispute over the return of the estates of Prince Ernst Ruediger von Starhemberg, the pre-World War II Heimwehr leader. These estates had been confiscated by the nazis and were now to be returned under the restitution law. The Socialists, who regarded the prince as the archenemy of the Austrian working class, condemned this decision. On Jan. 7 they called a token strike, and on the same day the Communists led demonstrations in Vienna. On Jan. 23 the Socialists introduced a bill to prevent Starhemberg from taking possession. This bill was bitterly opposed by the People's party and the extreme right-wing Union of Independents on the grounds that being directed against a legitimate court decision it undermined the rule of law. The Socialists argued that Starhemberg, by being largely responsible for the collapse of Austrian democracy, had put himself outside the rule of law. Finally a compromise was found. A bill was passed which empowered the government to suspend for an indefinite period the operation of the court decision. The estates were placed under the administration of the provincial authorities concerned. The coalition was shaken but not broken.

Throughout the year suspicion and bitterness between the two coalition parties was heightened by allegations of jobbery and corruption in the administration of nationalized industries and banks. The judiciary was accused of bias in these matters. On Sept. 16 Otto Tschadek, the Socialist minister of justice, resigned and was succeeded by the nonparty expert Josef Gerö.

The People's party, itself an uneasy alliance of industrial, agricultural and white-collar interests, remained subject to internal strains. Tension within the party found expression in the resignation on Jan. 23 of three People's party ministers: Eugen Margaretha (finance), Josef Kraus (agriculture) and Felix Hurdes (education). They were replaced by Reinhard Kamitz, Franz Thoma and Ernst Kolb (all People's party), respectively.

The first task of the reorganized government was to cope with the worsening economic situation. In this it was only partially successful. Inflation was stopped but export prices could not be reduced sufficiently to make up for the ending of boom conditions in the world markets. The slackening of demand for exports coupled with severe credit restrictions caused a considerable increase of unemployment. In some of the provinces the position became so serious that funds had to be made available for relief works. All this despite the fact that in this the last year of the European Recovery program, a further \$120,000,000 was pumped into the Austrian economy. Total ERP aid received by Austria therefore amounted to approximately \$920,000,000 or about four times as much as the League of Nations loan granted to Austria after World War I calculated at present day prices. It began to be widely recognized that the continued dependence of the Austrian economy on foreign aid was the result not only of the burden of occupation and the soviet hold on important industrial assets but also of Austria's inability to trade with its neighbours in eastern Europe.

Relations with Yugoslavia improved considerably. In June Karl Gruber, the foreign minister, visited Marshal Tito and reached general agreement on the desirability of expanding trade between the two countries and on reopening the common frontier. The latter point was settled in detail at a conference

held at Bad Gleichenberg in September.

Friendly relations between the Austrian government and the western occupying powers continued and were extended—too much indeed for the liking of the Communists who alleged that Austrian foreign policy was directed by the U.S. state department.

Soviet policy toward Austria seemed to take a more favourable turn with the permission to resume traffic on the Danube river between Vienna and the U.S. zone. But the soviet view continued to be that Austria was not democratized, that "fascist" influences had not been eliminated, and that rearmament was carried on in the western zones. In these circumstances negotiations for concluding the long-awaited state treaty were continued in an atmosphere of pessimism. In March the western powers put forward a shortened draft of the treaty (it contained only 8 clauses instead of 59). Designed to by-pass minor disagreements, it was in effect much less favourable to the U.S.S.R. than the longer version. It left out provision for the payment of \$150,000,000 by Austria in return for soviet cession of the German assets, nor did it deal with soviet claims on Austrian oil production and on the Danube Shipping company. The subsequent exchange of notes showed that, although the Russians were unwilling to slam the door on the Austrian treaty, the shortened draft did not provide a basis for its conclusion.

(V. T. E.)

Education.—Schools (1951-52): elementary and private 4,517, pupils 622,603, teachers 24,992; secondary 167, pupils 61,634, teachers 3,896; technical and commercial 31, pupils 8,652, teachers 1,266. Teachers' training colleges 35, students 4,030, professors and lecturers 548; universities 4, students 12,939, professors and lecturers 1,825.

Finance and Banking.—Budget (1952 est.): revenue 18,669,000,000 schillings, expenditure 19,700,000,000 schillings. Internal debt (Dec. 1949): 11,826,000,000 schillings. Currency circulation (July 1952) 8,720,000,000 schillings. Bank deposits (June 1952): 8,940,000,000 schillings. Monetary unit: schilling with an exchange rate (Nov. 1952) of 72.40 schillings to the pound sterling and 21.42 schillings to the U.S. dollar.

Foreign Trade.—(1951) Imports 14,027,000,000 schillings; exports 9,635,000,000 schillings. Main sources of imports (1951): U.S. 22.2%; Germany 16.8%; U.K. 9%; Italy 5%. Main destinations of exports: Germany 14.2%; Italy 11%; U.S. 8.8%. Main imports: coal, grain, machinery and vehicles. Main exports: iron, steel and manufactures, pulp, paper and manufactures, and wood.

Transport and Communications.—Roads (1947): 53,000 mi. Licensed motor vehicles (Dec. 1950): cars 51,300, commercial vehicles 47,000. Railways (March 1951): 3,761 mi.; passenger-miles (1950): 2,670,000,000; freight, ton-miles (1950): 3,311,000,000. Telephones (1951): 412,394. Radio receiving sets (1950): 1,318,000.

Agriculture.—Main crops (metric tons, 1951 except as indicated): wheat 343,000; barley (1952) 268,000; oats (1952) 347,000; rye 334,000; maize 159,000; potatoes 2,149,000; sugar (raw) 159,000. Live-stock (Dec. 1951): cattle 2,280,548; sheep 362,457; pigs (March 1951) 2,523,182; horses 283,025; goats 322,816; poultry 6,971,694.

Industry.—Insured persons employed (Aug. 1951): 2,046,000. Fuel and power (1951): coal 195,000 metric tons; lignite 4,992,000 metric tons; manufactured gas 305,000,000 cu.m.; electricity 5,652,000,000 kw.hr.; crude oil (1950) 1,525,000 metric tons. Raw materials (metric tons, 1951): iron ore 2,376,000; pig iron 1,050,000; steel ingots and castings 1,028,000; magnesite 664,000; lead (smelter) 9,500. Manufactured goods: woven cotton fabrics 14,400; cotton yarn 21,800; wool yarn 20,800; rayon staple fibre 41,800; paper 261,000.

Autobiography: see ENGLISH LITERATURE; etc.

Automobile Accidents: see ACCIDENT PREVENTION.

Automobile Industry. Many factors deterred automobile production in the United States during 1952, the longest stoppage being caused by the nationwide steel strike. By October, a total of 3,531,257 automobiles and 971,120 commercial vehicles had been manufactured, or 24% less than in the same period of 1951. The National Production authority continued its restrictions on the number of units to be produced, while the Controlled Materials plan was still stringent in its allocation of aluminum and copper.

Despite the restricted production, the United States continued to lead the world in vehicle output. In 1951 the U.S. automobile industry turned out 6,765,263 cars and trucks. This repre-

Below, right: THE 1953 PONTIAC Custom Catalina

sented 72% of the total world output for that year. During that year, the United States exported 478,000 vehicles, while importing 24,413.

Defense.—The task of stepping up defense production, while at the same time maintaining a profitable level of civilian output, was continued in 1952. This was accomplished in spite of the strikes and shortages which cut off steel and other materials from the industry's assembly lines. From the start of the Korean conflict to mid-spring of 1952, the industry added more than 40,000,000 sq.ft. of floor space to its facilities. Besides the demands on working space, there was an even more urgent need for machine tools and heavy equipment. Throughout the year the industry accelerated its tooling program in an endeavour to catch up on its huge backlog of defense contracts.

During the year, more dual-purpose plants were being constructed. In these factories both civilian and defense production were carried on under one roof. One manufacturer produced cargo planes for the air force alongside of civilian automobiles. Another automotive firm combined the production of 3.5-in. bazooka rockets and automobile parts in one factory. Production of the largest and most powerful reciprocating engine in the world was started by one firm as others were building aircraft components and assemblies as well as completed aeroplanes. The automobile industry also played a major role in the country's jet aeroplane program, not only in the construction but also in research and design. Several companies devoted as much as 60% of their work to defense, turning out, in addition to aircraft and parts, tanks and tank cannon, tactical trucks, shells

and many other military items. The ordnance department of the army returned the tank assembly line of the Detroit tank arsenal to its original operator, the Chrysler corporation. While private industry had taken over the actual tank production, the ordnance department had retained the functions of research and development, inspection and construction of gauges for government standards.

Materials.—Shortages of materials was the greatest production problem of the industry. Copper and steel headed the list of hard-to-get materials, with aluminum running a close second. Early in the year, the Defense Production administration alleviated the aluminum situation somewhat by allocating an additional 1,000,000 lb. of that metal to the industry out of government reserves. Even with the new stock of aluminum, it was still the supply of materials that set the pace for production rather than the quarterly production quotas decreed by the National Production authority. Although the second quarter quota of passenger cars was pegged at 1,050,000, the auto producers would have been able to turn out only 800,000 had they

put as much copper into each automobile as they had previously. However, by stretching out their existing supply through substitution and design changes, the car makers produced nearly 1,000,000 automobiles during the second quarter.

Toward the end of April the shortages showed promise of clearing. Chrome stainless steel had been removed from rationing under the Controlled Materials plan; the ban on natural and synthetic rubber had been lifted as were the restrictions on the use of lead; in spite of the impending strike, the Defense Production administration planned to relax steel controls by the end of the year.

During the first week of May, however, Chile broke off the year-old agreement to sell 80% of its copper to the United States at a fixed price, and decided to enter the free world market. To help counteract this move the government withdrew more copper from its stock pile and removed the ceiling price on imports.

The next blow to the industry was the steel strike, which started on June 2. June and July saw stock piles depleted, supply lines exhausted, and production slowed down to a near all-time low. Even after a settlement was reached on July 24, new restrictions deterred the return to full production. All expectations of lifting steel controls by the end of the year were forgotten when the National Production authority and the Defense Production administration came out with their formula for steel distribution. Top priority for steel shipments was given to military production, and civilian production dislocations were inevitable. Complete restoration of civilian production did not occur until fall.

In the battle for conserving critical materials, the automotive industry waged its own campaign. Engineering ingenuity was expected to save 30,000,000 lb. of aluminum in 1952, through redesign, substitution and improved methods. Through 1951 and 1952, conservation on the part of industry and production cut-backs promised to save nearly 400,000,000 lb. of aluminum and copper. In terms of production this was enough copper to build 7,000,000 cars and enough aluminum for 6,000,000 cars. These savings, however, rather than being destined for automobile production, were earmarked for defense purposes.

Engineering.—During the year, new devices, designed for the comfort and convenience of the driver, appeared on several automobile models. Among these was the automatic headlight dimmer. This device automatically lowers the driver's headlight beam when another car approaches at night. A photocell, mounted near the steering wheel, is the heart of the instrument. It picks up the light from an oncoming car, changes it to an electrical signal, and sends it to an electronic amplifier to be magnified. The voltage (signal) coming out of the amplifier operates a switch which lowers the beam. For operation of the automatic system, the conventional dimming switch must be on "high." An auxiliary switch adjacent to the dimmer may be depressed if it is desired to prevent the system from lowering the beam. In the event of failure in the electronic part, the dimmer can be operated manually.

It was announced in 1952 that air conditioners would be available as optional equipment on at least three 1953 model cars. Several types were introduced. Using nontoxic Freon in a completely sealed refrigeration unit, one model was basically the same as those in offices and railroad trains. Mounted on the rear shelf in the trunk compartment, the unit caused no appreciable appearance changes in the automobile. Another air conditioner drew in fresh air from the outside instead of recirculating that already in the car. The air was not only cooled, but also freshened and dehumidified. When cooled by one of these air conditioners, a car that had been standing in the sun at high temperatures could be made comfortable after driving only

PLASTIC MODEL of the average U.S. male, constructed by the Ford Motor company in 1952 for use in designing automobile seats, arm rests, head and leg room, etc. Based on army physical records for World War II, the average U.S. male weighed 164 $\frac{3}{4}$ lb. and was 5 ft. 9 in. tall

a few city blocks. The desired temperature was maintained by a single control on the instrument panel.

Tinted glass, which enjoyed limited use in 1951, came into its own in 1952. The bluish-green tint excludes up to one-half of the radiant heat and ultra-violet rays which usually penetrate ordinary glass, and appreciably reduces glare from the headlights of oncoming cars during night driving. Starting with a band of shaded green glass at the top, the colouring fades out imperceptively toward the bottom of the glass pane.

A four-barrel carburettor, yielding better volumetric efficiency (breathing ability) at high speeds, was introduced on several 1952 models. Power steering, found on only one 1951 automobile, was extended to five 1952 cars. Brought out in 1951, power braking was available on two models in 1952.

The race for horsepower supremacy continued in 1952 as one automobile manufacturer released a 190 h.p. engine. Of even greater importance, however, was the continued trend toward higher compression ratios. The average compression ratio in 1952 was 7.18:1, compared with 7.11:1 for 1951. Research was being conducted on engines with compression ratios as high as 12:1.

More rolling laboratories, futuristic experimental automobiles which feature new developments in automotive design, appeared in auto shows and exhibitions. While these cars of the future were not intended to be mass produced, many of their engineering features would be incorporated in coming models. One truck builder introduced automatic transmissions on his line of delivery vehicles.

Employment.—Automotive centres were severely beset by unemployment at the beginning of 1952. As the year started, there were more than 100,000 workers idle in the Detroit, Mich., area alone. Among the factors blamed for the distress were the restrictions of the National Production authority upon automo-

bile production, shortages of critical materials, and the long lead time involved in converting from civilian to military production. However, with the companies catching up on their tooling programs, and with new contracts going into the automotive centres, the employment situation showed improvement during the year. Except for the interruption which came with the steel strike, the number of unemployed diminished to the extent that by early fall a man power shortage was realized in some areas. It was interesting to note that the greater need was for the unskilled labourer rather than the semiskilled or skilled worker.

Prices.—The Capehart amendment to the Defense Production act, rather than supply and demand, continued to be the scale by which the Office of Price Stabilization weighed petitions of automotive concerns for price increases. Higher production costs forced the majority of the car makers to apply for price boosts, most of which were granted. Price advances of up to \$200 were seen through the first quarter of 1952. A few cut-backs were realized, however, when several companies reduced the amount of expensive conversion steel used in their cars. Such a reduction, under the Capehart amendment, necessitated corresponding price reduction.

Price increases of another nature were seen in August, as a modification of ceiling price regulation 83 permitted franchised new car dealers to employ a less rigid system of price controls. Specific dollars-and-cents ceilings on new cars, by make, were ended, since the ceilings were to be determined by the individual dealer markups. The new regulation reinstated discounts and preparation charges on new automobiles equal to those applying before the Korean war. With "basic" price ceilings eliminated, the dealers were allowed to use markups based on one of two periods—the pre-Korean war period (April 1, 1950, to June 24, 1950) or a Korean war period (Jan. 25, 1951, to Feb. 24, 1951). Though factory wholesale prices were to remain unchanged, a 1% increase in the cost to the consumer was expected.

Prices on new cars climbed in 1952, but taxes rose even higher. By midyear it was estimated that of \$2,000 paid for a new automobile, \$650, or about a third, went into taxes.

Styling.—The possibilities of mass producing sports cars in the United States were investigated by two manufacturers, the Packard Motor Car company and Buick Motors division, as both companies unveiled their versions. While immediate production was not scheduled for either model, the producers exhibited the sports cars to test public reaction and to determine the possible extent of the market for such an automobile.

Packard's model, the Pan-American, was powered by a 185-h.p. modified stock engine and had wire wheels and a rear-mounted spare. Chrome was minimized to give the car a smooth appearance over the finely styled fenders. Only 37½ in. high, the Pan-American featured a low centre of gravity, making it easy to handle when turning corners.

Like the Pan-American, Buick's model, called the Skylark, also had wire racing wheels. Mounted on a conventional chassis, and propelled by one of Buick's standard engines, the automobile embodied several features suggesting the continental mode of sports car styling, such as swept-down doors and cut-away fenders. Automobile Racing. Troy Ruttman of Lynnwood, Calif., annexed the most desired honours in the sport when he piloted his Agajanian Special home first in the 500-mi. race at the Indianapolis speedway on May 30, 1952. The 22-year-old winner, youngest driver in the classic, finished in the elapsed time of 3 hr. 52 min. 41.88 sec., and

pushed his car to a new record for the event by averaging 128.922 m.p.h. Victory came to Ruttman when Bill Vukovich of Fresno, Calif., the leader, crashed into the northeast wall with only eight laps to go. Ruttman, who had been second to Vukovich for many laps, received \$61,743 in prizes. The race, which was seen by more than 175,800 persons, carried awards of \$230,100, the biggest purse in its history.

Second place went to Jim Rathman of Chicago, Ill., driving a Grancor-Wynn's Special, who averaged 126.723 m.p.h. Sam Hanks of Glendale, Calif., was third; Duane Carter, Culver City, Calif., fourth and Art Cross, Morristown, N.J., fifth.

Driving the same car, Ruttman added to his achievements for the season by taking the 200-mi. Southern Speedway A.A.A. championship grind at Raleigh, N.C., July 4. The young coast star collected \$6,000 after a close duel with Jack McGrath, Los Angeles, Calif., who finished two laps behind in a Hinkle Special. Carter was third and Rathman fourth.

George Hill, Burbank, Calif., drove an Estes Mercury Special, a "hot rod" built in a California back-yard shop, to a new international class C mark over the mile course on the Bonneville salt flats of Utah. Hill averaged 229.77 m.p.h. in the car owned by Bob Estes, Inglewood, Calif. More than 20 other records in classes C, E and F were made in Utah, where Lieut. Col. A. T. Gardner, 61-year-old British ace, fell two-fifths of a second short of his own world standard of 200.6 m.p.h. for the 5-km. run. Gardner, after setting five American class E marks and three new international times, cracked up his supercharged MG racer on Aug. 16, but returned to the flats on Aug. 21 to set three marks in the national class F.

Fonty Flock, Decatur, Ga., piloted a 1952 Oldsmobile to first place in the Southern 500-mi. stock car race at Darlington, S.C., Sept. 1. Flock won the \$6,000 first prize by a two-lap margin over Johnny Patterson, Huntington, W.Va., who drove a 1952 Hudson.

Midget auto racing continued to grow in popularity and the 1952 championship of the American Automobile association was taken by Johnny Tolan, Denver, Colo., who scored a total of 3,516 points.

(T. V. H.)

Aviation, Civil. Most significant of the events in civil aviation during 1952 were the success of scheduled air-line tourist fares on the North Atlantic route and the introduction of regular turbojet air-line travel. North Atlantic tourist services were inaugurated May 1, with a New York-London fare of \$270, using the carriers' largest and most modern equipment. During the first three months of its operation approximately 150,000 persons crossed the North Atlantic, compared with 100,000 in the same period of 1951. With the seating density much higher than that operated in regular service, the 50% traffic increase was achieved by only a 10% increase in the number of flights.

At the same time the average number of passengers carried on first-class flights rose by nearly 20% over the previous year's pace.

The advent of British Overseas Airways corporation's Comet service between London and South Africa stirred competing lines the world over into action. Though shorter-ranged than piston engine aircraft, the 36-passenger British jet's 450-500 m.p.h. cruising speed and vibrationless comfort made it the world's most exciting mode of air travel. Pan American World Airways led the U.S. operators with an order for three improved Comets for 1956 delivery, after no U.S. manufacturers were able to quote delivery dates or prices on a U.S.-built jet liner.

United States air transportation continued its remarkable growth. Revenue passengers increased nearly 10% over the previous year, from about 25,300,000 to 27,800,000, while the

FIRST AIR COACH passengers to take off for Europe on the low-fare flights inaugurated by 11 transatlantic air lines in May 1952

volume of revenue passenger-miles moved up sharply from 14,242,000,000 to 17,100,000,000 or 20%.

Carriers comprising the United States air transportation industry (exclusive of Alaska) included in 1952: 14 domestic trunk lines, 20 local service, 4 certified cargo, 12 international, 3 territorial, more than 50 large irregular and a substantial number of small irregular carriers who are not required to report operating results to the federal regulatory agency—the Civil Aeronautics board.

The territory of Alaska, because of terrain and lack of integrated surface facilities, is basically dependent upon air transportation. It was served by 11 certificated air lines and approximately 100 pilot owners, or bush pilots as they are better known.

The figures in Table I compare industry activity during 1951 with estimated 1952 volumes. They do not include intra-Alaska air services and small irregular air carriers. A breakdown of this activity by carrier group is shown in Table II.

Table I.—U.S. Commercial Air Transport Industry

Item	1951 (actual)	1952 (est.)	Per cent increase
Traffic			
Revenue passengers	25,315,179	27,773,400	9.7
Revenue passenger-miles (000)	14,241,714	17,099,100	20.1
Mail ton-miles	90,918,031	102,836,400	13.1
Cargo ton-miles	391,806,831	411,233,100	5.0
Total revenue ton-miles (mail, cargo and passengers)	1,915,101,892	2,193,486,800	14.5
Revenue			
Passenger revenues	\$809,609,318	\$959,283,400	18.5
Mail revenues, U.S.	120,975,375	122,114,500	.9
Cargo revenues	110,522,160	118,593,900	7.3
Other revenues	38,339,997	37,886,100	1.2*
Total operating revenues	\$1,079,446,850	\$1,237,877,900	14.7

*Decrease.

Important actions in the development of United States air transportation during the year included the approval by the Civil Aeronautics board of two air-line mergers and active consideration of several others, reflecting a policy of encouraging the formation of fewer but stronger carrier organizations.

The local service experiment was continued by the renewal of temporary authorizations, and in the international field permanent operating rights were granted to Pan American and Trans World Airlines for the important transatlantic section of their certificates.

A large portion of the traffic increase in 1952 was the result of a substantial expansion in the volume of domestic air-coach

services with the reduction in rates in April. The maximum fare per mile for off-peak hour service was reduced to 4 cents, from a basic fare of approximately $4\frac{1}{2}$ cents per mile, established in Nov. 1950. The response to this fare reduction was evident in the 40% increase in coach passenger-miles—proportionately greater than the 20% experienced in first-class traffic—from 1,200,000,000 to 1,700,000,000 in fiscal 1952 over fiscal 1951. Domestic coach traffic in 1952 represented 15% of the total revenue passenger-miles flown by the domestic trunk-line operators. The Air Transport association's economic research department reported 1,017,082,000 air coach passenger-miles flown during the first six months of 1952, compared with 599,696,000 in the same period of 1951.

Table II.—Principal Divisions of U.S. Air Transport

Item	1951 (actual)	1952 (est.)	Per cent increase
Revenue ton-miles			
Domestic trunk lines	1,204,665,707	1,382,554,100	14.8
Domestic local service lines	31,739,077	36,114,500	13.8
International and territorial (except Alaska)	396,128,093	464,190,900	17.2
Certificated cargo lines	100,576,038	90,012,300	10.5*
Irregular carriers	181,992,977	220,615,000	21.2
Total revenue ton-miles (mail, cargo and passengers)	1,915,101,892	2,193,486,800	14.5
Operating revenues			
Domestic trunk lines	\$658,520,841	\$757,257,800	15.0
Domestic local service lines	37,643,132	42,341,100	12.5
International carriers	299,098,518	327,954,500	9.6
Certificated cargo lines	17,690,063	12,288,900	30.5*
Irregular carriers	66,494,296	98,035,600	47.4
Total operating revenues	\$1,079,446,850	\$1,237,877,900	14.7

*Decrease.

Production of Transport Aircraft.—High air-traffic levels in 1952 were accompanied by increased demands for new and additional capacity. Since the beginning of 1951 materials had been allocated for the production of 492 new transport aircraft, with a value of more than \$425,000,000, for United States air carriers. In addition, substantial allocations were made for aircraft purchased by foreign air lines. Of this total, 192 aircraft were delivered in 1951 and 1952, through September, with the balance of 300 scheduled for delivery through the first quarter of 1955. These aircraft would produce a lift which would be more than double that of the fleet in the carriers' possession at the end of 1950, thus assuming sufficient flexibility for expansion of traffic and retirement of some obsolete aircraft types.

Included in the backlog of transport planes were 12 passenger-carrying helicopters which had been approved for the inauguration of shuttle service in two major metropolitan areas in the country.

Lockheed reported that it would deliver 19 Super Constellations by July 1953 to transatlantic carriers. Of these, nine were to go to Royal Dutch Airlines (K.L.M.) and ten to Air France. These planes could be modified to seat 99 for tourist travel, compared with 65 for standard flight. Douglas announced it would deliver 20 new DC-6B's in the same period for the European passenger shuttle. These 39 additional planes alone would increase the passenger capacity of the transatlantic carriers by approximately 50% in 1953.

While three years earlier the U.S. flag carriers flew about 70% of the transatlantic traffic, by 1952 it was divided about 50-50 between U.S. and foreign carriers. Sir William P. Hildred, director-general of the International Air Transport association, pointed out that Pan American World Airways, largest of all international carriers, had 22,000 first-class and 21,000 tourist passengers between May 1 and Aug. 15. This compared with a 29,000 total for the same period in 1951. During the same time, Trans World Airlines, the other U.S. flag line operating regular transatlantic flights, increased from 21,000 in 1951 to 30,000 in 1952. The foreign flag carriers over the North Atlantic had

an increase of 66% in the ocean-crossing traffic for the summer of 1952, compared with the previous year.

Passenger fatalities on the domestic U.S. scheduled carriers, in relation to the volume of traffic carried, decreased substantially during the year. The 12-month period ending Sept. 30 was one of the best in the air lines' history, with 0.38 passenger fatalities per 100,000,000 passenger-miles. This compares with 1.3 fatalities during the calendar year 1951. Three spectacular accidents, involving one large irregular carrier and two scheduled air lines, occurred near Elizabeth, N.J., in late 1951 and early 1952 and resulted in the temporary suspension of activity at the Newark airport. Service was later restored on a restricted basis. A direct outgrowth of the Elizabeth accidents was the appointment of the President's Airport commission to study the problems of airport location.

Vice-Adm. Emory S. Land, president of the Air Transport association, calling attention to the naming of 42 scheduled U.S. air lines as winners of National Safety council awards, pointed out that during the period covered there had been an average of 12,464 daily take-offs and landings, and the percentage of fatal crashes was roughly 1/10,000 of 1%. He quoted traffic figures to prove that it was nine times safer to fly than it had been in 1931.

On June 30 the Civil Aeronautics board released its second subsidy separation report, wherein it established, for international, territorial and overseas operations of United States carriers, an administrative separation of service and subsidy mail payments. For the fiscal year 1952, the board estimated that subsidy payments amounting to \$45,343,000 had been included in the total mail payments of \$63,112,000 made to international, territorial and overseas carriers. The report notes that subsidy support for these operations would tend to increase during the next several years.

During the year a study was initiated to develop a multi-element service rate structure for use in mail rate-making procedures. The study, which would differentiate between terminal and transit costs, was being conducted by interested government agencies in co-operation with the air carrier industry.

Plans for mobilization of the air transportation industry moved ahead in 1952. The department of defense presented the initial requirements of the civil reserve air fleet and the Civil Aeronautics board released its proposed war air service pattern, a plan to provide service for essential wartime traffic with equipment remaining with the air lines after military diversion.

Current mobilization planning reflected the desire of the military agencies to maintain a strong civil transport system during a wartime emergency. In 1942, after the outbreak of World War II, the scheduled air lines were permitted to operate only 166 twin-engine aircraft. Under the 1952 plan, it was contemplated that more than 800 twin-engine and approximately 300 four-engine planes would be available for servicing priority traffic in wartime. Significantly, the civil reserve air fleet plan called for contract operation of military services by the air carriers rather than by militarization of the equipment or personnel. (See also AIRCRAFT MANUFACTURE; AVIATION, MILITARY; CIVIL AERONAUTICS ADMINISTRATION; JET PROPULSION; PETROLEUM.)

(A. O. C.)

Great Britain, Commonwealth and Europe.—The introduction of the mark I Comet jet liner on three routes of British Overseas Airways corporation was the outstanding event of 1952 in the civil aviation field. This mark of Comet had been criticized on the grounds that it had too short a range and carried too small a pay load. Fears were expressed that control authorities would not be able to give it adequate aids or fit it into traffic patterns, and that the cost of maintenance, particularly of en-

THE AG-1, first aeroplane designed exclusively for agricultural use, could carry up to 1,200 lb. of spray or dust, turn quickly at the end of a crop row and be controlled easily at low speeds and altitudes. The plane was constructed under contract of the Civil Aeronautics administration

gines, would be heavy. The first service, London-Johannesburg, began on May 2. The second, London-Colombo, opened on Aug. 11. The third, London-Singapore, started on Oct. 10 and was later to be extended to Tokyo. In general, the first six months of operation gave little support to the fears which had preceded the Comet's appearance: right up to the end of the year advance bookings on the Comets remained heavy, and the first six months' maintenance costs were no heavier than those for comparable piston-engined aircraft. The Comet was not unduly handicapped by bad weather or by the difficulty of obtaining navigational aids and traffic control systems appropriate to its high speed, nor by its high flying speed and high fuel consumption while waiting at low altitudes to land. However, its makers had realized that its limitations had to be tackled: by Feb. 16 the Comet II prototype had begun test flying.

The Comet II promised to give a stage length of about 2,000 mi. (Comet I, 1,500 mi.) with 44 passengers (Comet I, 36); in this mark the Avon engine was used instead of the Ghost. After several hundreds of hours' flying experience had been gained with the Avon, the design was announced—and deliveries promised in 1956—of the Comet III, which would have a range of 2,700 mi. carrying 58 to 78 passengers. Various United States operators at this time made inquiries about deliveries: Eastern Air Lines withdrew because delivery dates were considered to be too remote; Pan American World Airways placed an order for three Comet IIIs to be delivered in 1956 and took an option on seven more for delivery in 1957. This arrangement meant that only B.O.A.C. and Pan American could have Comet IIIs in 1956. It was estimated that the maximum output in later years would be 70 a year. But with the announcement of a new engine, the Conway, reputed to have a much more economical fuel consumption, there were hints that a Comet IV would appear in 1960. Five other international operators had placed orders for Comets of various marks: two slightly modified Comet Is were delivered to Canadian Pacific Airlines for use between Honolulu and Sydney; three Comet Is were to be delivered to Union Aeronautique Transport for the Paris-French Equatorial Africa and Paris-Saigon services. Six of the later Comets were on order for the British Commonwealth Pacific Airlines' Vancouver-Sydney service; two Comet IIs each had been ordered by the newly revived Japan Air Lines and by the Linea Aeropostal Venezolana.

Meanwhile, there was no sign in the United States either of agreement between operators and constructors or of enterprise on the part of a constructor that would produce competition for the Comet. On the other hand it was suggested that a second British constructor was designing a jet liner.

Some operators resolved their dilemma without hedging: the Belgian line, Sabena, announced flatly that it would have nothing to do with jets at this stage but would wait to see the jet aircraft expected from the United States; K.L.M. decided to re-equip with modern piston-engined aircraft; the Australian Qantas Empire Airways ordered the new Super Constellation to supplement and replace its existing Constellations; other companies turned to the DC-6 and DC-7. Even B.O.A.C. ordered some additional Stratocruisers. There were two reasons (apart from the desire to avoid the troubles of the Comet's development period) for sticking to piston-engined planes: one was the prospect of an expanding second-class tourist traffic, for which high-capacity aircraft were needed; the other was a belief that the advantage of the Comet's speed could be offset by the abnormally long range of the newest orthodox liners, a belief first expressed when the Comet began operations to South Africa. On the London-Johannesburg run the Comet had to refuel five times and about one hour was spent on the ground at each landing. It was pointed out that when K.L.M. received its Super Constellations, it would be able to compete with the Comet on the same run on a similar time schedule by making only one refuelling halt between Amsterdam and Johannesburg. A similar argument applied to the London-Australia route. There Qantas would be able to fly 4,000-mi. stage lengths, compared with the Comet II's 2,000-mi. stages, thus making range offset the difference of about 120 m.p.h. in the cruising speeds of the two planes without sacrificing pay load.

*B.O.A.C., B.E.A. and associated companies.

For tourist traffic, the value of capacious aircraft on the busy routes had already been proved. Eleven operators ran tourist services at reduced fares on North Atlantic routes during 1952 and from May to September offered among them up to 3,460 seats each week at fares roughly 30% below the standard fares. When the season opened the total number of seats available each week was only 2,452, of which Pan American Air Lines provided 738 and Trans World Airlines 420; Trans-Canada Air Lines came next with 280, having turned over the whole of its capacity on the Atlantic route to tourist traffic; at the same time B.O.A.C. offered 136 seats but at the season's peak it had 544 weekly. The cheaper fares were made possible by fitting more seats in the aircraft and by cutting down the lavish hospitality en route. Heavy traffic justified the experiment but, except at the height of the season, operators had to accept a large flow of one-way traffic. At the end of the year financial analyses of the first year's tourist business were still awaited but the trend toward the liner with many seats had been established. This development turned attention toward the new Britannia turboprop liner which made its first flight on Aug. 16 and had been ordered for B.O.A.C. Its seating could be arranged to carry 98 passengers and it was expected to have long range. The still bigger turboprop liner, the Princess flying boat, which made its first flight a week later, still appeared to be of no interest to air-line operators although it could be fitted to

Table IV.—Revenue Statistics for British Air Lines

Item	(Financial years, April 1—March 31)			
	B.O.A.C.*		B.E.A.	
	1951-52	1950-51	1951-52	1950-51
Operating revenue	£33,567,862	£24,252,115	£10,817,687	£8,998,821
Operating expense	32,164,801	27,564,071	12,060,005	9,796,079

carry 200 passengers.

The principal business feature of the year therefore was an intensification of traffic on existing routes rather than the exploitation of new routes; and a general marked increase in loads and revenue was reported. Only one new route of any importance was opened. This joined Australia and South Africa by way of the South Indian ocean. On Sept. 1 the fortnightly service between Sydney and Johannesburg began with calls at Perth (western Australia), the Cocos Islands and Mauritius. It introduced the longest oversea stage at present being operated—that of 2,763 mi. between Cocos and Mauritius. This service was linked with the regular route through Asia by means of a spur running from Cocos to Jakarta (formerly Batavia) and Singapore, and there were hopes, as eastern Asia became more settled, of tapping traffic between Asia and South Africa. The new service was operated with Constellation aircraft and the spur with DC-4s. Its opening depended on the construction of a landing strip 10,000 ft. long and 1,000 ft. wide on one of the bigger islands of the Cocos group (West Island) and on the installation there of a radio beacon and passenger accommodation and facilities. The preparation of the airport was undertaken by the Australian government and that of facilities by Qantas Empire Airways, which operated the service. During the year, the restoration to Japan and Germany of rights to resume international services was announced. Steps were taken by both countries to procure commercial aircraft and to secure help in training crews.

The restriction of supplies of aviation fuel because of strikes in mid-1952 at U.S. oil refineries led to a slight diminution of services, chiefly freight services. There were also some dislocations in services normally passing through Cairo, first when mob violence occurred in Cairo and Alexandria and later when the abdication of King Farouk made conditions temporarily unsettled. During both periods (in the second, up to October) aircraft on services to and from the far east and Australia made an alternative call at Beirut in Syria, and those on African routes called at Tripoli (Libya). There had been some loss of traffic in the interval, particularly mail traffic from British troops serving in the Suez Canal Zone.

British European Airways, heavily affected by the halving of the foreign currency allowed to British citizens for holiday purposes, was able to report a record profit of £109,300 for the month of July. This operator had had the heaviest loss—£1,423,000—in the preceding financial year and expected in the current financial year to show a loss, but it was beginning to find the benefit of its new aircraft. For the first time since the end of the war, B.O.A.C. returned a small profit—£274,999—in its 1951-52 financial year. Two companies showed signs of prosperity. Sabena's profit was £1,378,309, and that of K.L.M. was about £1,000,000. Air France made a modest profit of £52,000. Trans-Canada Air Lines showed its first profit since the war—£1,390,000. These results occurred in a year in which the total number of passengers on all air lines rose by one-third, to 39,000,000. The percentage increase in passengers was not regular over all lines. B.O.A.C. and B.E.A., for instance, reported an increase of 25% and Air France an increase of 20%. Sabena's increase was 33% and that of K.L.M. was 24%.

British helicopter services for passengers ceased during the year but a Belgian postal service working a circuit of 230 mi.

BRITISH DE HAVILLAND COMET at Khartoum, A.-E. Sud., where it was met by camel-mounted Sudanese police. In 1952 England became the first nation to begin regular jet air-liner service

from Brussels through six towns to Antwerp was operated with regularity and success. B.E.A. had on order at the end of the year a small number of two-engine twin-rotor helicopters capable of carrying 12 to 14 passengers, and had put out a specification for a 40- to 50-seat helicopter.

Air carriers' liability for third-party damage was redefined at a conference held in Rome during September by the International Civil Aviation organization. Under this plan maximum liability, except in cases of wilful damage, was related to the loaded weight of the aircraft involved and provision was made both for claims to be heard in the courts of the country in which an accident occurred and for awards to be enforced if necessary in other countries. The highest liability in respect of loss of life or injury was set at £13,150 per person. Acceptances of the new convention by member countries were being received during the later months of the year. (E. C. SD.)

Aviation, Military. **United States Air Force.**—The outbreak of the Korean war in June 1950 found the United States with a 48-wing air force. As the air force climbed from 48 to 68 to 84, and then to 95 authorized wings, the increases in strength of the other services and in their money authorizations moved up correspondingly. In Oct. 1951 the joint chiefs of staff approved the 143-wing air force program. Their decision, put into effect in July 1952 with the congressional appropriations acts for the fiscal year 1953, gave a 50% increase to the air force (126 combat wings plus 17 troop carrier wings) with no such corresponding increase for the other services. Thus, the idea of a balanced force as a roughly equal three-way division of funds among the services was modified. This change in the concept of balanced forces was influenced

by recognition of the revolution taking place in weapons and centred on atomic power.

Although the build-up toward the 143-wing air force goal called for increases in personnel, equipment and installations, the larger air force called for only 14% more military personnel than the 95-wing air force which was achieved during 1952.

The air conduct of the Korean war in 1952 was little changed from the previous year, although there were new bombing attacks against power plants near the Yalu river and rebuilt factories and supply dumps, beginning in June and continuing through the year. The U.S.A.F. carried on its strangling attacks against North Korean and Chinese Communist communications and supplies (begun in Aug. 1951) and maintained air superiority over the battle lines as well as over North Korea. This was done in the face of a steady increase in enemy ground defenses and a greatly enlarged enemy air force. U.S.A.F. Sabre jets continued to knock down MIG-15s at a better than 7 to 1 ratio, and by Sept. 30, 1952, 20 U.S.A.F. pilots had become jet aces as a result of air victories over soviet-built MIG-15 interceptors.

To increase the striking power of the United States far east air forces, two wings of the strategic air command's F-84 jet fighter aircraft were flown across the Pacific by refuelling in flight.

Additional assignments of units and aircraft were made to the far east air forces and to the NATO (North Atlantic Treaty organization) forces in Europe. With United States assistance, the number of useful modern combat aircraft at NATO's disposal, including F-84 jets, was increased considerably after July 1951. More modern operational bases became available, and by 1952 U.S. F-86 Sabres were stationed in the United Kingdom.

Three U.S.A.F. bases in French Morocco were expected to be operational by the end of the year. The air base at Thule, Greenland, begun in March 1951, was operational and opened for

inspection to United States and Danish newsmen in Sept. 1952. This northernmost air base in the world, carved out of the frozen arctic, afforded a new and shorter route between the great capitals of the world and was of the greatest importance to future aviation, both military and civil.

The air defense system of the United States was bolstered by the inauguration of 24-hour sky watch duty by civilian volunteers of the ground observer corps, beginning July 14. The reporting and tracking of low-flying aircraft by trained individuals supplemented the electronic pickup on the air defense command's radar net, but could be completely effective only when all projected posts and filter centres along both coasts and the Canadian border were fully manned. At the end of the year, thousands of additional volunteers were needed to strengthen the system.

The increase in air force units and activity called for an increase in production of aircraft. Total aircraft deliveries for the air force in July 1952 were more than five times that of June 1950, at the outbreak of the Korean war, and by the end of 1952, production was expected to be nearly seven times the production of July 1950.

Several new planes were unveiled during the year. The Boeing YB-52, an eight-engine jet swept-wing Stratofortress designed to gradually replace the intercontinental B-36, made its first flight on April 15. The swept-wing Convair YB-60, an eight-engine swept-wing jet version of the B-36, made its first flight April 18. The air force ordered production of an undisclosed number of delta-wing F-102 Convair jet interceptors, the first operational aircraft designed to fly at supersonic speeds. The F-102 was developed from the experimental Convair XF-92, the first delta-wing aircraft known to have flown successfully. Also in production in substantial quantities was the air force's only tanker aeroplane, the Boeing KC-97, a military version of the Stratocruiser.

It was announced in July that no additional B-36 heavy bombers would be ordered, although the B-36 would remain the backbone of the country's strategic air potential for some time to come. Serious damage to the B-36 inventory of the U.S.A.F. occurred when a tornado struck Carswell air force base, Tex., on Sept. 1. Of the B-36s then there, 1 was demolished and 71 others were damaged in varying degrees. Preliminary estimates indicated that the cost of repairs, including the reconstruction of damaged base facilities, would be about \$48,000,000. In addition, 35 other B-36s at the near-by Consolidated Aircraft plant suffered damage. Prompt institution of a large-scale emergency repair program reconstituted the combat effectiveness of both wings around Oct. 1.

For the sixth successive year the air force investigated reports of "flying saucers," but found no evidence that the frequency of the "sightings" revealed a planned threat to the security of the United States.

On March 25 two Republic F-84G Thunderjet fighter bombers dropped practice bombs on a target at a halfway point of a 4,775-mi. nonstop flight in which they were refuelled six times by Boeing KB-29 tankers. The flight from Langley air force base, Va., to Edwards air force base, Calif., and return, was accomplished in approximately 11 hr. 20 min.

In April the air force admitted that an F-84 jet fighter aircraft had been successfully launched from a B-36 bomber in flight.

As of July 1, 1952, the air force began using the nautical system of knots and nautical miles (instead of "miles per hour" and "statute miles") as the official unit of measurement. The change was made to facilitate navigational measurements and standardize interservice usage.

Aviation history was made on July 31, with the arrival of

two United States military helicopters at Prestwick, Scot., at the end of the first crossing of the Atlantic by rotary-wing aircraft. The flight of 3,410 mi. in five legs was completed in a flying time of only 42½ hours at an average speed of 80 m.p.h. Actually, 17 days were involved in the flight in two Sikorsky H-19 helicopters by four air force veterans of air rescue operations in Korea, which left Westover air force base, Mass., on July 15. The helicopters were later flown on to Wiesbaden, Ger., for use in air rescue work there.

For five days in August, 14 U.S.A.F. C-54s, on a round-the-clock schedule, carried 3,763 Moslems without charge 800 mi. from Beirut, in Lebanon, to Jidda, Saudi Arabia, 40 mi. from the holy city of Mecca. The United States acted on a plea from the Lebanese government when regular air lines and other transportation could not cope with the thousands of pilgrims converging at Beirut from all parts of Islam in their effort to reach Mecca in time for the festival of Id al-adha on Aug. 28. Among the pilgrims flown on this good-will mission were outstanding leaders of the Moslem world.

As of April 1, the air force special weapons command, with headquarters at Kirtland air force base, N.M., became a part of the air research and development command, with headquarters at Baltimore, Md., to operate as the air force special weapons centre.

A new air group, the crew training air force, was established in March at Randolph air force base, Tex., under the air training command, to give advanced training in combat flying. This included training 3-man crews for the Boeing B-47 Stratojet, 11-man crews for B-29 Superforts, and training in combat tactics for fighter-bomber pilots and fighter-interceptor teams.

To enhance the prestige of noncommissioned officers and to stimulate leadership, the air force, effective April 1, restricted noncommissioned officer status to the top three airmen grades of master, technical and staff sergeant. The grades of sergeant and below were redesignated airman, 1st, 2nd, and 3rd class, with private redesignated basic airman. Pay and duties of the airmen were not affected by the change.

In Korea, aircraft under the operational control of the far east air force flew a total of 514,135 sorties through Oct. 10, 1952. During the same time, 642 aircraft of all types were lost to enemy fire. Casualty statistics as of Oct. 10 indicated a total of 469 deaths and 786 missing in action during the 28 months of the Korean war.

(H. S. Vg.)

United States Navy.—Navy and marine corps squadrons, operating over Korea from carriers and land bases during 1952, added to the record they had compiled during the first year and a half of war. Month after month they contributed at least 35% of the combat sorties flown by United States forces in the Korean theatre. While truce talks continued and ground action was localized, virtually the entire effort of naval aviation squadrons was devoted to interdiction. Patrol squadrons continued their daily flights over Korean waters and to the south maintained their vigil over Formosa strait.

Control of the seas around Korea was held by the United Nations. Although naval forces were not called upon to fight off similar enemy forces, their presence assured the United Nations command a free use of the sea and the offensive employment of the carrier striking force prevented enemy use of airfields in northeast Korea to contest that freedom.

Because of the narrow target area of the Korean peninsula, the carrier's prime assets of speed and mobility could not be fully utilized. However, the carrier's advantage of consistently operating from positions far to the north of the land-battle area made possible a concentrated aerial bombardment all the way from the Communist front lines to the boundaries of Manchuria and Siberia. The fast carrier aircraft concentrated

Above: CONVAIR XP5Y-1, U.S. navy patrol flying boat and the first turboprop sea-plane built. It had a top speed of more than 350 m.p.h. and a take-off time of less than 30 sec.

Right: LOCKHEED F-94C STARFIRE, U.S. interceptor plane with all-rocket armament

Below, left: REPUBLIC F-84F THUNDERJET, U.S. swept-wing fighter-bomber, shown with the external stores it can carry in various combinations, including fuel tanks, rockets and bombs

Below, right: SUD-OUEST 6025 ESPADON, French single-seat jet fighter

Lower left: AVRO 698, British four-jet delta-wing heavy bomber, capable of near sonic speed and of carrying very heavy bomb loads on long-range flights. It was flown for the first time in 1952

Lower right: H05S-1 helicopter, the U.S. marines' designation of the Sikorsky S-52-2, a utility plane used for short-range flights in rescue and military service

in the main upon the northeast section where they could carry out a sustained schedule of air operations against railroads and highways linking Communist armies with Manchuria and Siberia. This was their main area of attack through the first half of 1952 as it had been since Jan. 1951.

The advantage of their behind-the-lines position was also utilized in the midyear shift of the U.N. air offensive and was in a large measure responsible for its strength and effectiveness. Attacks on the hydroelectric power plants along the Yalu river and the mountain streams of North Korea in June 1952 marked the shift. These targets were in northwest Korea and a majority of the attacking aircraft were navy and marine. Carrier aircraft flew entirely across the peninsula, as they had on the bridge strikes of Nov. 1950, to hit the major plant at Suiho, 40 mi. from the mouth of the Yalu and far into the home grounds of the Communist air force. Follow-up strikes on these and other targets found carrier aircraft attacking in co-ordination with land-based aircraft in all parts of North Korea except in the northeast, as at Chongjin and the near border towns of Aoji and Musan, where they carried out the attack alone.

Increased offensive power had resulted from the new capability for delivering special weapons from fleet aircraft carriers. Jet type aircraft had been further integrated into routine fleet operations and models of higher performance were in production and under test. Continued study of antisubmarine warfare toward the improvement of instruments and techniques had increased the navy's potential for the protection of shipping in time of war. Tactical doctrine for special uses of aircraft, airships and helicopters in this important function and in the offensive and defensive aspects of mine warfare had been incorporated in fleet air training.

The construction of facilities for the production of guided missiles marked the approach of their assignment to fleet task forces. Two heavy cruisers and one submarine, which in 1952 were being converted to guided-missile use, would add power to the fleet. Units were training in the operational techniques of missile launching to ensure their effective use.

In July, the keel of the "U.S.S. Forrestal" was laid at Newport News, Va. In the same month the congress authorized the construction of a second carrier of this class. These carriers were designed to meet the operating requirements of faster and heavier aircraft. (See also KOREAN WAR; NAVIES OF THE WORLD.)

(M. B. G.)

U.S.S.R.—The biggest question in any evaluation of world air power in 1952, as it had been during the previous five years, was the standing of the air forces of the Soviet Union. The biggest gamble faced by military air planners of the western nations was the determination of what kind of aircraft they must build, and how many, to balance the threat of the growing soviet air power.

The President's Air Policy commission of 1947 (the Finletter board), basing its judgment upon intelligence then available, came up with the conclusion that some time in 1952 the soviet air force would be capable of making an air attack in force against U.S. industrial centres with atomic bombs. Whether or not such a level of competence had been reached by 1952 was a matter for speculation. A great deal had been written about the organization and equipment of soviet air forces but, in spite of more than two years of contact with the soviet-equipped Chinese forces in Korea, very few facts concerning the quality or quantity of soviet aircraft existed outside of official circles. In the 1952 edition of his book *The Soviet Air Force*, the British author, Asher Lee, admitted "there are no experts on Russia—there are only varying degrees of ignorance."

Guesses as to the total air strength of the U.S.S.R. ranged

from 8,000 to 20,000 first-line combat aircraft, with the probability of equal numbers in reserve. The true number was unknown, but no one could doubt that a formidable air strength existed. It was known that high-grade aeronautical research had been going forward since the end of World War II, bolstered by captured German technicians. It was known also that large and active production facilities were in being and that they had been turning out aircraft continuously since the end of that war. A long-standing program of training young pilots had undoubtedly made available to the soviet air staff a large supply of tough-minded and well-trained airmen. There was every reason to believe that many of the MIG-15 fighters that had been encountered on the Korean front were flown by soviet pilots. These were therefore accumulating actual combat experience, and the lessons of actual air warfare were being transmitted daily to air force headquarters. Gen. Hoyt S. Vandenberg, chief of the air staff of the U.S. air force, summarized soviet air power as a "highly-organized and versatile complex of air forces, armed with first-class equipment, well informed as to the latest techniques, and supported by a massive industrial and research structure over which it exercises the highest priorities."

Apart from air-to-air contacts on the Korean front, the principal source of information with respect to new soviet types during the year was the annual demonstration on Red Air Force day at the Tushino air field in Moscow. These displays were not run off with the openhandedness of the British at their annual Farnborough display, but they afforded occasional glimpses of new types of aircraft that yielded hints as to the direction of soviet design-thinking. The rather meagre information on 1952 soviet aircraft which follows is based upon these sources as reported in the aviation technical press.

The well-known MIG-15 still appeared to form the backbone of soviet fighter squadrons, but several improved models were reported. A twin-engined single-seated version was observed in considerable numbers in east Germany. This machine appeared to have two axial-flow engines in the wing roots and was apparently somewhat heavier and more powerfully armed than the original model. It was said to mount four 23-mm. or four 30-mm. cannon. The other variation was apparently a night fighter with a single engine (and possibly an afterburner). It was a two-place type, probably pilot and radar operator. The nose had been modified to permit installation of radar gear above the engine air intake.

Another fighter development reported early in 1952 was the MIG-19. This was said to be a short-bodied swept-wing fighter with tail surfaces carried high above the fuselage. It was said to bear a very close resemblance to the German Focke-Wulf-103, designed at the end of World War II by Kurt Tank.

In the light bomber or attack field the Ilyushin IL-26 with twin jet engines mounted in wing nacelles appeared to be in widespread service use but a slightly smaller version of the same type was also reported. The probabilities were that it was fitted with newer higher thrust engines which would give it somewhat increased performance over the IL-26.

A wholly new type of light bomber which would eventually replace the IL-26 series was reported. This was identified as the EF-150. It was said to be the work of a group of German design engineers. It was described as a swept-wing monoplane with a span of more than 100 ft., powered by two axial-flow jet engines of more than 10,000-lb. thrust each, suspended in nacelles under the wings. It was said to have a top speed in excess of 600 m.p.h. and to be able to operate at high altitudes. It was handled by a crew of three.

The other important development appeared to be in the big bomber field. Until recently, the only reported long-range

bombers of importance were the TU-4, a soviet-built adaptation of the U.S. B-29 class bomber. It now seemed probable that a new machine—the TUG-75 long-range intercontinental bomber—was under active development. Whether or not any of these machines had been built and flown was not known but the general specifications had been reported. The design was apparently based on the use of six turbine-driven propeller engines, probably a development of the German BMW-028 engines. The fuselage was said to be long and slim, and the wings of high aspect ratio with a moderate degree of sweepback. Its range and other performance capabilities would probably be similar to those of the U.S.A.F. B-36 bomber.

It was also well known that the soviets were not depending entirely on long-range bombers of the TUG-75 class to deliver intercontinental air attacks. They had available to them many of the former German V-2 experts and they were unquestionably developing long-range guided missiles of greater capability than the German V-2. There were many indications that experimentation with guided missiles was going forward at a high rate in the U.S.S.R. As with all such projects in every country, an almost impenetrable veil of secrecy was drawn about them so that details were of a much more highly speculative nature than for conventional aircraft development. In the guided missile field, soviet scientists must be credited with a “know-how” equal to that found in any other country.

Power Plant Developments.—Little was known of the details of soviet aircraft engine development but, judging from the reported performance of their aircraft and the examination of the few actual pieces of equipment that had come into U.N. possession in Korea, their engine designers were keeping up with design progress elsewhere. Not only were German jet engine technicians made available to the soviets at the end of World War II, but a number of British-built jet power plants were

delivered to soviet satellites in 1947 and 1948. There was no question but that they had been able to develop better engines than the ones they received from Great Britain at that time. They undoubtedly increased the thrust capability of these engines and, at the same time, developed engines of considerably greater thrust, probably approaching the 10,000- to 11,000-lb. class. The projected use of turboprop engines for the TUG-75 bomber has been mentioned, but how soon such engines might be available in quantity was entirely unknown.

In the rocket engine field for use in guided missiles, again details were lacking, but the soviets had plenty of German experience to draw upon and there was no doubt that considerable progress was also being made in such fields.

Great Britain and the Commonwealth.—In contrast with the “close to the chest” attitude of the soviets with respect to their new aircraft, the British display their latest research and service types early in September of each year at the Farnborough show sponsored by the Society of British Aircraft Constructors. On this occasion, observers from all over the world are given opportunity to inspect machines on the ground and observe their performance in flight, and the event is always given full coverage in the aeronautical press.

The most striking thing about the 1952 display was the obvious trend toward the delta (or arrowhead) wing. Machines of this type had appeared in experimental form a year earlier, but had now been translated into service types. One notable example was the two-seat Gloster Javelin, which was the first British operational aircraft with delta wings. It was reported to be able to fly at speeds higher than the speed of sound. It was powered with two Armstrong Siddeley Sapphire engines, each with a static thrust of more than 8,000 lb. It was being put into production for probable service use late in 1953.

The largest delta-wing aircraft jet to be flown was the four-jet Avro 698 bomber. This was a very large aeroplane capable of carrying big bomb loads over long ranges. Although recently

JET R.A.F. VAMPIRE “attacking” its German base at 550 m.p.h. during 1952 air manoeuvres less than 15 mi. from the soviet zone frontier

FLEET OF PLANES used by test pilots and scientists conducting basic research in the trans-sonic and supersonic speed ranges in 1952 at the High-Speed Flight Research station, Edwards air force base, Calif.

completed and with but a few flight-test hours behind it, it put on a notable flying exhibition at Farnborough. In addition to the two service-type delta-wing aircraft, a number of research machines were on display, enough to indicate a very marked trend in that direction in British design thinking.

A new all-weather day-and-night fighter, the de Havilland DH-110, exhibited high-speed, high-maneuvrability characteristics but suffered an unfortunate accident on Sept. 6 when it disintegrated in flight and killed its crew and a number of spectators on the ground.

Two other new swept-wing single-seat fighters were shown, the Hawker Hunter and the Vickers-Supermarine Swift. Both these machines were on Great Britain's so-called superpriority production list.

In the light bomber field the production model of the English Electric Canberra B-2 was on display. This twin-jet high-speed bomber later in the year made a round trip across the Atlantic in a single day. It had been selected by the U.S.A.F. for production in the United States.

In the big bomber field, in addition to the Avro 698, the Vickers Valiant in recently modified form was displayed. This machine was one of the most beautiful and most efficient aerodynamically to have been built anywhere. It was notable for the fact that its four jet engines were almost completely buried within its wings with practically no external projections.

For the royal navy, the Fairey Gannet in its production form put in an appearance. This aeroplane was powered with double turbine-driven propellers. It was intended for antisubmarine warfare.

The 140-ton Saunders-Roe Princess flying boat, designed originally for the overseas operations of B.O.A.C. and later turned over to the royal air force for a troop transport, made flight demonstrations during the Farnborough show. It was one of the world's largest flying boats, with a total weight in excess of 300,000 lb. It was powered with ten Bristol Proteus turbine-driven propeller engines.

Power Plant Developments.—Great Britain continued its all-out development of jet and turbine propeller engines. Improvement in power output and reduction in fuel consumption had been continuous, but no outstanding new types appeared during 1952. The power range ran from small turbine units of 1,500-lb. thrust up to large jet engines delivering 10,000 lb. or more.

Outstanding engines in the pure jet class were the Armstrong Siddeley Sapphire of more than 8,000-lb. thrust; the Bristol Olympus with a static thrust of 9,700 lb. and the Rolls-Royce Avon at 6,500 lb. All these engines were listed for high production priority to meet the production requirements of the royal air force.

In the propeller turbine field, the important production engines were the Armstrong Siddeley Python and the Mamba by the same company. The former delivered 3,670 brake hp. and 1,180 lb. of thrust, and the latter 1,320 brake hp. and 400 lb. of thrust. The Bristol Proteus was rated at 3,300 brake hp. and 1,200 lb. of thrust. Rolls-Royce, in addition to its straight jet types, had a small propeller-turbine type, the Dart, which in its latest form was good for 1,400 brake hp. and 365 lb. of thrust.

In addition to these conventional engines, Great Britain was also working on rocket types of power plant, both for land aircraft and for guided missiles, but in this field detail developments were hidden behind security restrictions.

Canadian Developments.—A number of British manufacturers had established branches in Canada for the production of parts or of completed aircraft. From the military point of view, greatest interest centred around the operations of Canadair Ltd. in Montreal, Que., and Avro and de Havilland in Toronto, Ont.

During 1952, Canadair Ltd. was producing North American-designed Sabre jets for the Royal Canadian air force. These machines were fitted with United States-built jet engines, but it was planned to install the Canadian-built Orenda engine when it was in production. Avro at Toronto was producing the only Canadian-designed and built military aircraft in the country. The CF-100 was an all-weather two-seat fighter, designed for installation of two Avro Orenda engines. The prototype was flown in 1950 but production models were expected to be coming off the line and being delivered to service squadrons late in 1952. A new plant for the production of the Orenda engine was completed and put into operation in the fall of 1952.

De Havilland's of Canada was producing only trainer and light transport types. During 1952 the first of the production DHC-2 Beaver aircraft were delivered to the U.S. air force.

Other Countries.—The main focal points for air power development continued to be the United States, Great Britain and the U.S.S.R. Outside of those areas little that was new appeared in 1952.

Two events took place, however, that were significant—the first full-scale air exercises under NATO (the North Atlantic Treaty organization) in September, and the inauguration of the so-called offshore aircraft procurement program under the U.S. Mutual Security agency.

NATO air strength was first demonstrated during the year at an international military air display in Brussels, Belg., in mid-July. On that occasion, military aircraft of the 14 NATO nations assembled for an aerial review. More significant, however, were the manoeuvres held in mid-September when more than 1,500 planes of the NATO nations took part in Operation "Blue Alliance." Previous NATO air exercises had been designed to check progress in particular areas, but "Blue Alliance" was intended to test the over-all progress and to determine the state of readiness of the NATO air forces. Planned NATO air strength was of the order of 4,000 planes by the end of 1952. That number was to be increased in the next two years, but no announcements had been made regarding top levels. The backbone of the NATO air force was in British and U.S. squadrons. It was known that the U.S. air force had ten wings in Europe, including fighters and strategic bombers.

The so-called offshore procurement program under the Mutual Security agency contemplated the purchasing of combat aircraft for NATO from European manufacturers using U.S. money. Such a plan was hoped to build up NATO air strength more quickly and to bolster up some of the lagging European aircraft industries. It was thought also that more aircraft could be obtained for the same money. During fiscal 1953, the U.S. was to contribute \$225,000,000 to the program, which was to be matched by \$175,000,000 from other NATO countries.

The program contemplated manufacture of aircraft by five outstanding European manufacturers. The Dutch Fokker Aircraft company would finish an order of British Gloster Meteors and would switch over to production of Vickers Armstrongs Swift, a swept-wing single-jet interceptor fighter. Rolls-Royce Avon engines for these machines would be provided by the Belgian Fabrique Nationale D'Armes. The French company Avions Marcel Dassault would build the MD-452 Mystere, a swept-wing interceptor fighter. This machine was to be powered by jet engines, the Atar 101D to be built by Société Nationale d'Etude et de Construction de Moteurs d'Aviation, also of France. The Fiat company of Italy would build both air frame and engine for the de Havilland Venom night fighter.

The 1953 program had not yet been completed by Oct. 1952, but contract negotiations were under way and it was contemplated that three-year production schedules would be laid down. These aircraft, together with machines that were already being supplied to NATO by U.S. manufacturers and by Canada, would greatly strengthen the western air forces in Europe. Bacteriology. Fertilizer from Garbage.—Since every bacterial cell is a microscopic chemical factory, the many possible applications of that fact stagger the imagination. One such application which had recently emerged was the compounding of a mixture of bacterial cultures which could transform the waste of a city or the stubble from farm crops into rich humus of miraculous growth-stimulating powers.

Garbage from which paper, wood, glass and metal had been removed was ground into small bits, sprayed with water containing a tablespoonful of bacteria per ton of garbage and com-

posted for three weeks. During that time the bacteria multiplied tremendously and digested the mass of garbage. At times steam rose from the heaps as the intense chemical activity elevated the temperature of the mass to 150° F. After one week the heap lost its resemblance to garbage and in three weeks a humus resulted so rich that vegetables grown in it were 25% larger and contained up to three times as much vitamin A as those grown in conventional fertilizers. The nitrogen content of this bacterially made soil was four times that of other soils, and grain produced from it was of a consistently higher protein content.

More than 50 strains of bacteria, of unrevealed identities except that many were said to have been isolated from the intestinal tracts of man and domestic animals, were blended together to fit the requirements of the type of garbage and the season. Since the bacterial starter can compost almost any organic substances, blends for such waste products as crop stubble, sugar cane fibre, water hyacinths, cotton waste and nutshells were produced. Experimental plants were planned for Cuba, Mexico, Australia and New Zealand. The conversion of "night soil," human excreta used widely as fertilizer in the orient, and which spreads the dread cholera and typhoid, into safe and rich fertilizer was also demonstrated.

It was estimated that in the United States alone, if all garbage were so composted, 30,000,000 tons of fertilizer per year would result, capable of fertilizing 10,000,000 ac. of land—and there would be no garbage disposal problem. The possible ultimate impact of microbial humus on a hungry world was vastly more important, however. Current rates of increase indicated that the world population would double in 70 years. Unless food production were increased at a comparable rate, there would arise a problem of how to feed those future millions.

The possibility of increasing both yields from and acreage of arable lands by the conversion of man's waste products to life-giving fertile soil by means of bacterial action suggested itself as a significant contribution to the solution of such a problem.

Therapy of Fungal Diseases.—A promising new weapon against the intractable fungal diseases appeared during 1952. Stilbamidine (4,4'-stilbenedicarboximidine) was used in the treatment of blastomycosis and actinomycosis and produced prompt therapeutic responses. It also proved efficacious against blastomycosis when propamidine (4,4'-diamidinodiphenoxypropane dihydrochloride) was administered locally. It was suggested that diamidines be given a further trial in treatment of severe yeastlike infections.

The failure of medically proven antibiotics to inhibit or kill pathogenic yeasts and fungi had been further complicated by the fact that their use against bacteria had often removed from the environment bacteria which were the normal antagonists and controlling factors for the fungus population. After antibiotic therapy many dangerous and even fatal cases of fungus infections had resulted. To reduce the prevalence of moniliasis infections after aureomycin therapy, methylparaben and propylparaben were incorporated into the drug.

Sexual Recombination of Bacteria.—Events of 1952 firmly established as fact the occurrence of biparental inheritance among bacteria, for which the normal mode of reproduction is binary fission. *Escherichia coli*, common intestinal bacterium of man, had demonstrated its ability to form prototrophs (an individual having characteristics of each of dissimilar parents) when two cultures of varying characteristics were mixed and plated out. For example, if a parent strain of *E. coli* which cannot synthesize proline but can synthesize methionine is mixed with a strain for which the reverse is true, plating the

mixture on a basal medium having all other growth factors but lacking in both proline and methionine will result in the growth of only such bacteria that are able to synthesize both required substances. Analysis of these occurrences revealed that few organisms mate since the number of prototrophs is always small. The longer the mixture is kept, the greater the chance of mating. By computation it was shown that bacterial collisions in the mixture occur 10,000 times as frequently as do matings. The possibility of agglutination in the liquid medium followed by cellular exchange after plating on basal media was not as yet ruled out.

Sexual recombination using drug-fastness to streptomycin as a criterion for prototrophs indicated *E. coli* to be capable of producing true genetic variants analogous to mutants of high resistance.

Prototroph recombination accomplished by intraperitoneal passage in guinea pigs of parent strains of *E. coli* showed a higher frequency of recombination, but subsequent increases of population density and temperature of test-tube experiments indicated that those were the only factors involved in the higher rate.

By comparison with sexual recombination, genetic transduction of hereditary traits by a filterable agent was also reported. When *Salmonella typhimurium* was grown in the presence of a weak bacteriophage, a filterable agent capable of transferring hereditary traits was produced. Individual filtrates may transduce nutritional, fermentative, drug-resistant and antigenic characteristics, but no more than one to a single bacterium. The agent is resistant to such bacterial disinfectants as chloroform, toluene and alcohol, and to the enzymes pancreatin, trypsin, ribonuclease and desoxyribonuclease. Some intertype transfers were observed such as the *i* flagellar antigen of *S. typhimurium* to *S. typhi* to produce a new serotype. These discoveries afforded new tools for both the bacteriologist and the geneticist which it was believed might soon yield greater understanding of inheritable traits at the most primitive level of the living cell.

Antibiotic Antagonism and Synergism.—The frequency with which unpredicted results occurred when two or more antibiotics were used in combination clinically induced test tube and animal studies of the phenomena. During 1952 some semblance of order began to emerge from the hitherto random pattern. It became evident that the wide spectrum antibiotics, aureomycin, terramycin and chloramphenicol, constituted a group apart from the others of more limited scope, penicillin, streptomycin, bacitracin and neomycin.

When combinations from the latter group were used, a high percentage of synergism (bactericidal action greater than the dosage of the agents used should warrant) occurred. When combinations of antibiotics of both groups were used, the largest per cent of antagonisms developed. In this case it seemed that the ineffectual agent negated the efficacy of the active agent. Combinations of wide spectrum antibiotics were of only additive value probably because of their close chemical similarities. There were no fixed pairs which could be designated antagonistic or synergistic because the bacterial strain involved seemed to be the determining factor. Under these conditions, complete bacteriological laboratory diagnosis should not only report bacterial sensitivity to single antibiotic agents but to combinations to facilitate maximum efficiency in antibiotic therapy.

(M. V. N.)

Badminton. The United States amateur badminton championships, held in 1952 at Seattle, Wash., as one of the sports features of that city's centennial celebration, drew a field of top stars. Martin Mendez of San Diego, Calif., annexed the men's senior honours for the third time by conquer-

ing Joseph Alston of Fargo, N.D., 15-3, 7-15, 15-6. Alston had lifted Mendez's crown the year before. Ethel Marshall, Buffalo, N.Y., left-hander, continued her domination of the women's ranks and gained her sixth consecutive title when she defeated Thelma Scovil, Long Beach, Calif., 11-3, 11-7. Miss Marshall paired with Beatrice Massman, Buffalo, N.Y., for the women's doubles as they triumphed over Thelma Scovil and Janet Wright, San Francisco, Calif., 15-10, 18-17. Wynn Rogers, Arcadia, Calif., and Alston combined for the men's championship, halting Mendez and Bob Williams, Williamsville, N.Y., 15-4, 15-8. Helen Tibbetts, Alhambra, Calif., and Rogers scored in the mixed doubles, setting back Ethel Marshall and Bob Williams, 17-16, 15-10. Fred Fullin, Norwalk, Conn., and Howard Holman, Fresno, Calif., took the veterans' doubles.

Malaya retained the world championship and the Thomas cup when it defeated the United States, 7-2, in the challenge round at Singapore in June. The United States stars had won the American zone title by halting Canada, 6-3, and then advanced to the last round against the defenders with a surprise 5-4 victory over India. (T. V. H.)

Bahamas. This British colony consists of about 20 inhabited and 680 uninhabited islands off the Florida coast. Area: 4,375 sq.mi. Pop.: (1943 census) 68,846; (1951 est.) 81,000. Language: English. Religion: Christian. Capital: Nassau (pop. 1943, 29,391), on New Providence Island. Governor in 1952, Maj. Gen. R. A. R. Neville.

History.—Butlin's vacation village at West End, Grand Bahama, remained closed, but it was reported in July 1952 that an offer of £805,000 had been made for the company's assets; however, no decision was reached and negotiations continued. The colony prospered as the result of a building boom, the substantial remittance to the colony from earnings of Bahamian labourers in the United States, and the continued growth of the tourist industry, the main basis of the islands' economy.

Immediate and future airport requirements were studied, account being taken of the possible use by B.O.A.C. (British Overseas Aircraft corporation) of Comet aircraft. The U.S. air force officially took possession of the first guided-missile bases in July.

The foundation stone of a new £300,000 hospital was laid in Nassau in March. Six out of eight bills for raising increased revenue were rejected by the house of assembly on the grounds that revenue already exceeded expenditure and that there was room for economy in government departments.

Great concern was expressed during the year about the possible extinction of the American flamingo, of which only about 15,000 were believed to exist. Their principal breeding grounds are in the Bahamas where their numbers had been diminishing rapidly in recent years. In 1952 the Society for the Protection of the Flamingo in the Bahamas was established.

Education.—Schools (1951): primary 178, enrolment 17,909; secondary 6, enrolment 598.

Finance and Trade.—Budget (1951 actual): revenue £2,044,385; expenditure £1,828,642. Foreign trade (1951): imports £7,650,419; exports £729,012; re-exports £290,643. Principal exports: lumber, tomatoes, crawfish and salt. Monetary unit: pound sterling; U.S. dollars also generally accepted. (Jo. A. Hn.)

Baltimore. Baltimore is the metropolis of Maryland and had an estimated population of 956,500 in Sept. 1952. The land area of the city is 78.72 sq.mi.; the water area,

13.21 sq.mi. Mayor in 1952: Thomas D'Alesandro, Jr., Democrat.

Budget appropriations for 1952 were \$166,657,113.38; for 1951, \$141,236,789.76. The city tax rate for 1952 was \$2.74 per \$100 of assessed valuation and the rate for 1951 was \$2.62. The taxable basis for 1952 was \$2,600,466,616 and for 1951 it was \$2,441,210,616. The gross funded debt, as of June 30, 1952, was \$217,350,100; the sinking funds amounted to \$36,423,944, leaving a net debt on that date of \$180,926,156, not including accrued income. The percentage of net debt to the taxable basis (excluding self-supporting indebtedness) was 4.4% for the year 1952.

The net enrolment on Oct. 31, 1951, in the public schools of the city was 81,321 white students and 43,873 Negro students; in addition, 12,605 white and 4,936 Negro students were enrolled in adult education classes. William H. Lemmel had been superintendent of the Baltimore city schools from July 1946. The public schools of Baltimore are a separate and distinct unit and are not under the jurisdiction of the state department of education.

Ranking as the second United States port in foreign-trade tonnage, the combined exports and imports at the port of Baltimore during the year 1951 amounted to 22,310,298 tons, compared with 15,058,935 tons for the previous year, or an increase of 48%. The port's foreign commerce in 1951 was valued at \$882,300,000 against \$568,800,000 in 1950. The volume of Baltimore's total overseas trade for the first four months of 1952 was reported at 8,057,900 tons, an increase of almost 18% over the 6,837,000 tons of similar commerce handled in the corresponding period of 1951.

Manufacturing activity in the Baltimore metropolitan area during 1951 continued the upward trend which began about the middle of 1950. Employment in manufacturing increased steadily throughout 1951, averaging 191,100, an increase of 21,775 workers, or 13% over the previous year. The leading industry groups based upon the volume of employment, included primary metal industries, blast furnaces and steelworks, food and kindred products, aircraft, apparel, fabricated metal products, machinery, electrical equipment, shipbuilding and repair, chemicals, automobiles, tin cans and tinware, beverages, printing and publishing. Total nonagricultural employment in the Baltimore metropolitan area, exclusive of self-employed, domestic servants and unpaid family workers, in 1951 averaged 520,300, an increase of 34,200 workers, or 7% over the 1950 average.

(C. N. E.)

Bananas: see FRUIT.

Banking. The money and capital markets of the United States experienced during 1952 the heaviest overall demands since the last year of World War II. The supply of savings funnelled through investment institutions to meet these demands was high, and the amount of bank credit expansion was less than in 1950 or 1951.

Shifting tactics during the year by the federal reserve brought about a large degree of uncertainty as to its operations in the money market. Member banks greatly increased their use of discounts and advances to obtain reserve funds, with their total indebtedness to the federal reserve banks rising to \$1,667,000,000 on Nov. 5. The yields on 91-day treasury bills reached a 20-year high of 1.903% on Aug. 12. The range of yields on Aaa corporate bonds was between a high of 3.03% and a low of 2.91%.

The total of all corporate securities issued in 1952 promised to exceed that of 1951 and set a new yearly high since 1929. From January through Aug. 1952, total new corporate securities offered for cash in the United States aggregated \$6,540,000,000 compared with the previous postwar record, \$7,741,000,000 for

HONOUR SYSTEM for making change, installed in 1952 at the Central National Bank of Yonkers, N.Y. Patrons deposited coins or bills, taking change from containers, and the bank reported all transactions perfectly correct after the first day's trial

the full year 1951. Bonds offered from January through Aug. 1952 totalled \$5,112,000,000, which was at a postwar record rate. Moreover, this was in addition to the issuance through August of \$1,427,000,000 of common and preferred stock, a much higher rate than in any recent year.

State and local government borrowings were at record levels in 1952, surpassing the previous high level in 1950. Commercial banks absorbed about one-half of the new state and municipal issues, with fire, marine and casualty insurance companies, individuals and personal trust funds accounting for the bulk of the remainder. A rise in yields on municipal obligations widened their market. New state and local government bond issues totaling almost \$1,300,000,000, virtually all of them to finance public improvement, were approved by the voters early in November.

The year saw another large increase in home-mortgage debt, although not as large as in the two preceding years. Savings and loan associations showed the largest increase in their mortgage portfolios, followed by the net additions by life insurance companies, mutual savings banks and commercial banks. Outstanding mortgage debt secured by 1- to 4-family houses stood at about \$57,000,000,000 on June 30, with Veterans administration-guaranteed and Federal Housing administration-insured debt accounting for somewhat more than two-fifths of the total.

Consumer credit expanded rapidly during the year. At the end of September, total consumer credit outstanding stood at a record level of \$21,656,000,000, a rise of \$2,300,000,000 during the preceding year and an increase of \$4,000,000,000 since June 1950.

The privately held money supply reached a new record high during the year. Thus, total deposits adjusted and currency outside banks stood at \$187,400,000,000 on Sept. 24, an increase

of \$9,500,000,000 over the figure of a year before. This increase was primarily the result of expansion of bank credit which amounted in total at all banks to \$10,200,000,000 during the same period, with the loan increase being predominant.

The volume of bank deposits at commercial banks in 342 reporting centres reached another record high level in 1952. The annual rate of turnover of demand deposits showed little increase from 1951 to 1952, although there was a rise in New York city.

New peaks were reached during the year in total loans and investments of all commercial banks, at \$137,090,000,000 by Sept. 24; in total loans, \$61,200,000,000; and in holdings of state and local governments and other securities, \$14,280,000,000. Commercial bank holdings of government securities showed little net change in 1952, and on Sept. 24 amounted to \$61,610,000,000.

On June 30, 1952, national banks, which numbered almost 5,000, held \$92,720,000,000 of total deposits. State banks, which numbered about 9,200, had total deposits of \$69,648,000,000.

Money in circulation showed a substantial increase during 1951, continuing the trend started in the preceding year. Late in 1952 money in circulation stood at an all-time high, in excess of \$30,000,000,000, about \$1,200,000,000 more than a year earlier. The usual seasonal variations in money in circulation were important short-run money market factors.

During the first quarter of 1952, the gold stock rose by almost \$700,000,000, continuing the increase which began in Aug. 1951. Starting in the second quarter of 1952, however, there was very little change in the gold stock, as merchandise exports fell sharply. At the end of October, the gold stock stood at \$23,340,000,000.

The year saw a further increase in the gross federal debt to almost \$265,000,000,000 on Oct. 31, about \$5,500,000,000 more than on Dec. 31, 1951, and about \$13,500,000,000 more than on April 30, 1949, the date of the lowest postwar debt. Gross federal debt was \$1,676.91 per capita on Oct. 31, 1952, and the computed annual interest rate on interest-bearing debt was 2.349% on that date.

During the second quarter the treasury obtained \$1,600,000,000 of new funds by increasing a number of its weekly bill offerings by \$200,000,000 each. In October the treasury offered 161-day tax anticipation bills, with \$2,501,000,000 issued at an average rate of 1.720%. In November another \$2,000,000,000 issue of 210-day tax anticipation bills was offered at 1.846%.

In May the treasury offered a 2½% nonmarketable bond, redeemable into 5-year, 1½% marketable notes, but obtained only a little more than \$300,000,000 from this issue. In June the treasury raised \$4,450,000,000 through offering a heavily oversubscribed 6-year 2½% bond, the first marketable bonds offered for cash subscription since 1945. A certificate issue of \$10,861,000,000, 11½ months at 1⅞%, was refunded into a 13-month note at 2⅞% on Oct. 1. During 1952, \$13,700,000,000 of marketable bonds, formerly restricted to nonbank ownership, became eligible for purchase by commercial banks.

Effective May 1, the savings bonds program was revamped, with new and more attractive savings bonds being offered. The new series E bond continued to be sold at 75% of maturity value, but the maturity was shortened slightly from 10 years to make the yield to maturity, 9 years and 8 months, 3% instead of the previous 2.9%. More important, the yield on the new E bonds, if redeemed in early years, was greatly increased compared with the former bond. Series F and G savings bonds were withdrawn and replaced with new series J and K, with the yield on both of these issues set at 2.76% instead of the 2½% on the old issues, and with a much higher yield if redeemed in early years than formerly. A new bond, series H, similar to the series E bond but with current income paid by check, was introduced.

The limits on the amount any individual could purchase annually were also raised. These actions had the result of narrowing the excess of redemptions over new sales, but the treasury was still not raising new money through the savings bonds program. Toward the end of the year there was much discussion of possible legislation by the next congress to raise the present 3% limit on the interest rate on savings bonds. (J. K. L.)

Mutual Savings Banks.—During the year ended July 1, 1952, the mutual savings banks of the United States had the third largest yearly net gain in assets and deposits recorded to date. The net gains of \$1,567,804,795 or 6.85% in assets and \$1,372,486,550 or 6.73% in deposits for the year were exceeded in the year ended July 1, 1945, with net gains of \$2,094,379,836 or 15.11% in assets and \$1,950,327,636 or 15.69% in deposits, and in the year ended July 1, 1946, with net gains of \$2,075,343,084 or 13.01% in assets and \$1,846,557,661 or 12.84% in deposits. On July 1, 1952, the combined assets of the mutual savings banks of the United States were \$24,459,830,255 and deposits were \$21,772,059,984. The combined surplus of the banks on July 1, 1952, was \$2,495,719,530 or 11.46% of deposits. There was an increase of 305,116 or 1.57% in the number of accounts during the year ended July 1, 1952, in contrast to a decrease of 123,258 or 0.63% in the previous year. On July 1, 1952, there were 19,713,231 accounts with an average balance of \$1,104.44.

Ten years earlier, on July 1, 1942, the average balance was \$660.58 and there were 15,674,831 accounts with total deposits of \$10,354,532,573. Over the ten-year period deposits in mutual savings banks increased 110.26% while the total number of accounts increased only 25.76%.

Dividends credited to mutual savings accounts averaged 2.38% for the year ended July 1, 1952, an increase from 2.05% during the previous year.

On Sept. 30, 1952, there were in operation 529 mutual savings banks with 245 branches. The number of branches put in operation in the first nine months of 1952 was 15.

As a result of the removal of the federal income tax-exempt status of mutual savings banks by the Revenue act of 1951, the banks increased their holdings of bonds other than U.S. governments, particularly tax-exempt municipal issues. The banks in New York state also secured legislation which permitted them to invest up to the lesser of 50% of surplus or 5% of assets in preferred, guaranteed or common stocks of corporations with the limitation of the lesser of 30% of surplus or 3% of assets applicable to common stocks. Investments in preferred and guaranteed stocks are subject to an earnings test while common stocks must have a ten-year dividend record and be listed on a national securities exchange. Bank stocks are specifically excluded. Included is the stock of any investment company all of whose shares are owned by savings banks.

New York was the 11th state to legalize the purchase of some type of equity securities by mutual savings banks, and the only one of the 11 states to prohibit the purchase of bank stocks.

The combined assets of all mutual savings banks on July 1, 1952, were invested as follows: U.S. government securities 39.35%, other securities 12.33%, real estate mortgage loans 42.54%, other assets 5.78%. The ratios on July 1, 1951, were: U.S. government securities 44.65%, other securities 10.92%, real estate mortgage loans 38.94%, other assets 5.49%. Insured mortgage loans, Federal Housing administration and Veterans administration combined, increased from 37% of the mortgage portfolio as of Dec. 31, 1950, to 44% as of Dec. 31, 1951.

British Trustee Savings Banks.—The combined funds of trustee savings banks in Great Britain increased £28,569,053 during the fiscal year ended Nov. 20, 1951, compared with an increase of £55,401,865 in the year ended Nov. 20, 1950. The comparative financial positions of the banks as between Nov. 20, 1950, and Nov. 20, 1951, were as follows:

	1951 £	1950 £
Cash balances due to depositors:		
Ordinary department	816,556,246	793,736,478
Special investment department	115,649,790	115,179,318
Government stock and bonds held for depositors (nominal value)	93,987,350	87,757,196
Combined surplus funds	18,402,806*	19,354,147
Total funds	1,044,596,192	1,016,027,139

*Exclusive of reserves for depreciation of investments held by the Special Investment Departments amounting to £1,329,416.

The total number of accounts of the three classes, ordinary, special investment and stock, was 7,605,173, an increase of 430,421 during the year ended Nov. 20, 1951, compared with an increase of 387,026 during the year ended Nov. 20, 1950. On Nov. 20, 1951, there were in Great Britain 85 trustee savings banks with 1,210 offices in operation. (HE. BR.)

Other Countries.—The new economic forces generated by the development of the world commodity boom immediately after the opening of the war in Korea and by its subsequent collapse about a year later dominated the banking scene in Great Britain, the commonwealth, Europe and the middle east throughout 1952. During the early months of the year the rise in the price level came to an end in most countries under the influence of the weaker turn in international commodity markets in the second half of 1951. The resulting check to the previous steady expansion in the demand for money for financing trade and commerce exercised a restraining effect on the growth of bank deposits. In the majority of countries the impact on banking structures of the change in the trend of prices was underlined by the credit restriction policies which many governments imposed in 1951 or in the early months of 1952 to counter inflationary processes set in motion by the earlier rise in the price level. In general the tendency in operating credit restriction was to place more emphasis on monetary controls such as the manipulation of the bank rate and adjustment of the money supply through central bank operations, and less emphasis on the so-called physical controls like the banning, or partial banning, of particular types of bank lending. Thus besides exerting a downward pressure on bank deposits, governmental measures often brought about wide and frequent changes in rates of interest for all classes of banking business. In some cases they also caused banks considerable worry over such questions as the adequacy of their liquid resources in relation to sight liabilities.

Toward the end of 1952 banking conditions became more stable over a large part of the area. By this time inflationary processes had been brought under control in many countries and in some countries had been so far reversed that it was considered advisable to reduce the bank rate and ease other monetary controls to avoid incurring the danger of precipitating a deflationary spiral.

During the early part of 1952 the banking system in Great Britain was required to adjust itself to the situation created by the government's decision late in 1951 to make more use of monetary controls in contending with inflationary pressures. Encouraged by a second rise in the bank rate from 2½% to 4% in March (in Nov. 1951 the rate had been raised from 2% to 2½%), the commercial banks increased rates of interest for all classes of business. The rate of interest on time deposits was stepped up to 2%. Charges for short-term loans to the money market were raised to a minimum of 2% and an entirely new scale established for ordinary loans to other business concerns

and private borrowers. The increased charges, coupled with the reduced demand for bank money for stock financing after the price fall and the banks' energetic response to the official request for a strict ban on loans for nonessential purposes, brought down the advances of the London clearing banks (which together account for about 95% of the country's commercial banking business) from an all-time high level of £1,953,000,000 in April to £1,748,000,000 in October. Compared with Oct. 1951, the latter figure showed a net fall of £149,000,000.

Eleven London Clearing Banks

(£ million)

	Oct. 1952	Oct. 1951	Oct. 1950	Oct. 1949
Deposits	6,167	6,204	6,204	6,050
Net Deposits	5,941	5,981	6,006	5,868
Cash	498	514	509	499
Call money	500	579	557	556
Bill holdings	1,112	1,340	1,414	1,162
Treasury deposit receipts	nil	177	496	744
Investments	2,142	1,555	1,505	1,517
Advances	1,747	1,897	1,598	1,466
Acceptances, etc.	373	481	346	261

The tendency for international trade to contract, the fall in the price level and a tightening of British exchange control restrictions on overseas credit combined to produce a severe contraction in the clearing banks' commercial bill holdings from £187,000,000 in February to £64,000,000 in September. Over the same period the acceptances item dropped from £532,000,000 to £386,000,000 for similar reasons. (C. H. G. T.)

Baptist Church. Evangelism was stressed by Baptists of the world during 1952. The emphasis was born of the persuasion that the mission of the Church is not merely worship of God and instruction in Christian principles but pre-eminently it is the specific endeavour to have people pledge their practical loyalties to Christ.

At the New South Wales Theological college in Sydney, Austr., 16 new students entered during 1952 making a total enrolment of 39.

Rev. A. J. Barnard was installed as principal of the Baptist Theological college in Johannesburg, Union of South Africa, Feb. 14, 1952. The year marked the diamond jubilee of the South African Missionary society.

The Baptist Union of India, Burma and Ceylon, organized in 1936, met at Cuttack, India, Dec. 29, 1951, to Jan. 1, 1952, and enlarged its scope to include Pakistan. In India and Pakistan, Baptists numbered 3,250,000, or one-half of all Protestant Christians in those countries. An awareness of their strength was revealed in their attitude toward foreign missionary organizations in their midst. Missionary "administrative machinery," they announced, "has become a stumbling block to the development of Baptist churches in our land. We are not Canadian Baptists, British Baptists, Australian, New Zealand or American or Swedish Baptists,—we are first of all Baptists of India and Pakistan. . . ." Without abandoning Baptist principles they pledged support to the ecumenical movement in their countries, believing their contribution to that cause would be the greater as they affirmed their own distinctions.

The Baptist General Conference of America (Swedish Baptists) observed its centenary June 26–29, 1952, in St. Paul, Minn. The first Swedish Baptist church in the U.S. was organized at Rock Island, Ill., Aug. 13, 1852. There were reported 65 foreign missionaries; 360 churches with 47,000 members; the *Standard*, the official publication, with 15,000 subscribers.

The Southern Baptist convention (U.S.) met in Miami, Fla., May 11–18; messenger registration totalled 11,003 and attendance 16,000. Twenty-two states were represented with a

church membership of 7,373,498, a gain of 98.8% in 25 years while the U.S. population increased 28.6%. Eight hundred and fifty missionaries were located in 30 countries, 35 being commissioned during the year.

The American Baptist convention (northern) assembled in Chicago, Ill., May 19-23 with a total registration of 11,556, delegates numbering 3,112. A major consideration was the merging of the Baptists of this convention with the Disciples of Christ, but this was decided against for the present. Forty-seven missionaries were appointed to home and foreign fields.

The Brazilian Baptist convention appointed 10 missionaries to the home field in 1952, bringing the total to 130.

The National Baptist convention, U.S. (Negro), reported an increased membership from 3,196,000 to 7,091,000 (121%) in 25 years. (See also CHURCH MEMBERSHIP.) (R. E. E. H.)

Barbados. This British colony is the most easterly of the Caribbean islands. Area: 166 sq.mi. Pop.: (1946 census) 192,841; (1951 est.) 213,000. Language: English. Religion: Christian (c. 70% Anglican). Capital and chief port, Bridgetown (pop. 1949, 13,700). Governor in 1952, Sir Alfred Savage.

History.—At the general election of Dec. 1951 the Labour party won 16 out of the 24 seats in the house of assembly.

A further levy on profits in the sugar industry to augment the contribution to a fund for the welfare of workers was legally established. Improvements in the terms of service of many senior civil servants in the colony also came into effect; and a commission was appointed to consider the conditions affecting the service of those in the lower grades, and to make recommendations. Other legislation set up a revenue equalization fund to guard against any possible future deterioration in the budgetary position; and two further acts gave additional assistance to the fishing industry and made third-party insurance compulsory for motorists. A bill which, if adopted, would make fundamental changes in the system of local government in Barbados came up for consideration. A comprehensive fiscal survey made by Professor C. G. Beasley, economic adviser to the comptroller for development and welfare, was studied in relation to the colony's proposed five-year development plan and was discussed at length in the press and elsewhere. The expansion and modernization of facilities at Seawell airport represented an important step in the development of the tourist industry. This airport conformed fully to the standards of the International Civil Aviation organization.

Education.—Pupils, elementary (Aug. 1952), 30,973; secondary (Aug. 1951), 2,838. Expenditure (1952-53): B.W.I. \$2,048,765.

Finance and Trade.—Monetary unit: British Caribbean or British West Indian dollar, set at 4.8 to the pound, and valued at 58.33 cents U.S. Budget (1952-53 est.): revenue B.W.I. \$12,390,194; expenditure B.W.I. \$12,049,294. Foreign trade (1951): imports B.W.I. \$51,918,327; exports (including re-exports) B.W.I. \$35,464,166. Principal exports: sugar, fancy molasses, rum. Sugar crop (1952), 167,876 tons. (P. H-Mv.)

Barkley, Alben William (1877-), vice-president of the United States, was born on a farm in Graves county, Ky., on Nov. 24, and attended Marvin college, Clinton, Ky., Emory college, Oxford, Ga., and the University of Virginia law school in Charlottesville, Va. He was elected prosecuting attorney of McCracken county, Ky., in 1905 and was judge of McCracken county court, 1909-13. He was elected to the U.S. house of representatives in 1912 and after 14 years there was elected to the U.S. senate. He was keynote speaker at the 1936 Democratic national convention, permanent chairman of the 1940 convention and delivered the speech nominating Franklin D. Roosevelt for a fourth term at the 1944 convention.

Throughout much of World War II he was senate majority

leader, and as such shepherded numerous wartime and emergency acts through that body. In 1946 when the Republicans gained control, he became senate minority leader. He was keynote speaker again at the 1948 party convention in Philadelphia, and there was nominated for the vice-presidency, being elected with Pres. Harry S. Truman and taking office in 1949.

Following President Truman's announcement of March 29, 1952, that he would not run again for the presidency, Barkley was mentioned prominently as a possible Democratic candidate. He formally announced his candidacy on July 6 but withdrew on July 21, opening day of the Democratic national convention in Chicago, Ill., after a group of labour leaders had objected to his age (74).

His address before the convention on July 23 received a great ovation, and despite his withdrawal he was placed in nomination for the presidency, receiving 48½ votes on the first ballot, 78½ on the second, and 67½ on the third, when Adlai Stevenson was nominated.

Barley. The United States barley crop of 1952, estimated at 222,476,000 bu., was of high quality but small quantity compared with the 254,668,000 bu. of 1951 and the 1941-50 average of 306,127,000 bu. The average per acre yield of 27 bu. approximated that of 1951 and exceeded the ten-year average of 24.9 bu. Hence the smaller harvest was the result of a 12% decline in harvested acreage, 8,226,000 ac., compared with 9,391,000 ac. in 1951 and a 12,315,000-ac. average for 1941-50. Farmers had expressed intentions early in the year of planting 9,752,000 ac., 90% as much as in 1951 but only 76% of the government goal for 1952, apparently preferring for price reasons to sow oats, flax or spring wheat instead. California was the leading producer with 53,892,000 bu. (42,360,000 bu. in 1951) and a record high yield of 36 bu. per acre. Minnesota was second with 25,162,000 bu., and North Dakota, usually the leading state, was third with 22,633,000 bu.

Prices received by farmers near harvest time averaged about \$1.40 per bushel.

Barley Production of the Principal Producing Countries

Country	(In thousands of bushels)			
	1952*	1951	1950	Average 1935-39
U.S.S.R.	294,636	257,051	325,000	425,000
Canada	222,476	254,668	171,393	88,882
United States	133,000	110,000	303,533	238,622
Turkey	105,000	81,500	94,020	96,129
Spain	100,800	80,700	78,000	97,059
United Kingdom	100,000	105,650	79,850	36,596
India	99,500	100,000	100,470	90,253
Japan	91,500	79,000	78,000	73,113
Denmark	81,500	78,000	74,180	52,881
Western Germany	78,700	76,560	67,600	79,000
France	53,000	68,500	72,200	53,004
French Morocco			50,000	53,275

*Preliminary estimate.

World barley production for 1952-53 was forecast at 2,710,000,000 bu. compared with 2,585,000,000 in the previous year and a prewar average of 2,365,000,000 bu. Substantial increases occurred in most areas, except the U.S.S.R., with Canada showing a striking increase. Acreage increased to 119,910,000 ac., compared with 115,560,000 ac. in 1951 and 116,370,000 ac. prewar. (J. K. R.)

Baseball. During the 1952 major league baseball season, Charles Dillon (Casey) Stengel piloted the New York Yankees to their fourth straight American league pennant and fourth straight world championship. He was the second manager in history to win four consecutive pennants and world titles. Only Joe McCarthy before him had turned the trick. Stengel had won both crowns in the first four years he was the manager of the New York club, despite the fact that as a major league manager before joining the Yankees, he had in nine years

been unable to place a team in the first division.

Player, Manager Changes.—Two new managers graced the American league scene when the 1952 season got under way. Rogers Hornsby was in charge of the St. Louis Browns, taking over for James (Zach) Taylor who had held the post when the Browns were purchased by Bill Veeck. Hornsby had led Beaumont to a title in the Texas league and followed that by guiding Seattle to a title in 1951. The other new manager was Lou Boudreau, who began the 1952 campaign as Boston Red Sox manager, having taken over for Steve O'Neill. His past-performance chart showed that as manager for the Cleveland Indians for nine years, Boudreau had won one pennant and world championship (1948) and had finished in the first division six times.

The season was less than two months old when Hornsby had a parting of the ways with the Browns. Named to take over for Hornsby was Marty Marion. "Mr. Shortstop," as Marion was known, had managed the St. Louis Cardinals the year before. When the Cardinals decided not to renew his contract after 1951, the Browns had signed him as player-coach.

Hornsby was not the only American league manager who did not retain his post until the season reached its conclusion. Detroit manager Robert (Red) Rolfe, who had starred at third base with the New York Yankees from 1934 through 1942, stepped down in favour of Detroit pitcher Freddie Hutchinson. Hutchinson first joined the Tigers in 1939.

The National league, too, saw changes in managers. Eddie Stanky started the 1952 season as the manager of the St. Louis Cardinals, after relieving Marty Marion following the conclusion of the 1951 season, although Marion had led the St. Louis team to a third place finish in 1951. Stanky was the only National league manager to start the season as a rookie pilot.

However, before the season came to a finale, other changes had been made. Tommy Holmes, who had taken over as field pilot for the Boston Braves after the 1951 season was under way, was relieved of his command. In his place, Boston owners installed Charlie Grimm, the baseball player who had gained fame two decades before while playing first base for the Chicago Cubs. "Jolly Cholly" had led the Milwaukee Brewers to a championship in the American association in 1951. Holmes was later hired by the Brooklyn Dodgers as a pinch-hitting specialist. At the season's end he returned to the Boston organization as manager of their Milwaukee Brewers club.

Eddie Sawyer, the man who had managed the Philadelphia Phillies "Whiz Kids" of 1950, was informed during the year that the front office was not pleased with his efforts. Sawyer's successor was Steve O'Neill, who the season before had seen service as manager of the Boston Red Sox.

James (Luke) Sewell was another National league manager who started the 1952 season at the helm of a club (Cincinnati), but did not remain in that post to see the season come to an end. In his stead came Rogers Hornsby, the former St. Louis Browns pilot. Billy Meyer remained in command of the Pittsburgh Pirates until the season was over, but shortly before its demise Meyer announced that he had resigned. It had been a dismal year for Meyer, who had been named "manager of the year" in 1948 for bringing home the Pittsburgh club in fourth place. His 1952 team suffered 112 losses while winning only 42 games.

The season had progressed less than a month when the New York Yankees moved into the trading market in an attempt to defend their world championship. Jackie Jensen, a young outfielder who had gained national fame as an All-American football player at the University of California, and Frank (Spec) Shea, a right-handed pitcher who had been unable to present a winning pitching record since 1947 in either the minors or the majors, were sent by the Yankees to the Washington Senators. In return,

JOE DiMAGGIO, centre fielder for the New York Yankees for 13 years, at Yankee headquarters after announcing his retirement as a player in Dec. 1951. He made his TV debut in April 1952 in Joe DiMaggio's Dugout, a weekly series of televised films about baseball

the Yankees received the contract of Irv Noren, a left-handed hitting outfielder who had hit .279 the year before with the Senators. The Senators traded away another of their outfielders in a deal with the Chicago White Sox. This time it was Sam Mele, a right-handed hitter. For Mele, Washington received the fleet-footed outfielder, Jim Busby, and second baseman Mel Hoderlein. In June the Detroit Tigers and Boston Red Sox got together and made a nine-player deal. Detroit gave up third baseman George Kell, who had led the American league in hitting in 1949, shortstop Johnny Lipon, outfielder Walter (Hoot) Evers and pitcher Paul (Dizzy) Trout. For the four Detroit players, Boston handed over five men on their roster, including first baseman Walter Dropo, infielder Johnny Pesky, third baseman Fred Hatfield, outfielder Don Lenhardt and left-handed pitcher Bill Wight. The Chicago White Sox obtained Jim Rivera, an outfielder, who had been White Sox property before being traded to the St. Louis Browns in 1951, and catcher Darrell Johnson from the Browns. In return for the pair, the Browns received outfielder Ray Coleman and the rights to catcher J. W. Porter. Shortly after the season reached the halfway point, the New York Yankees obtained left-handed pitcher Johnny Schmitz from the Brooklyn Dodgers in a waiver deal. Another waiver transaction took place between the Detroit Tigers and St. Louis Browns,

this one involving eight men. The two principal participants were right-handed pitcher Ned Garver, who won 20 games for the Browns in 1951, and Detroit outfielder Vic Wertz. The Cleveland Indians gave up infielder Johnny Berardino and cash for shortstop George Strickland and right-handed hurler Ted Wilks of the Pittsburgh Pirates. Ray Scarborough, right-handed pitcher, was shipped from the Boston Red Sox to the New York Yankees for cash. The Yankees obtained another pitcher when they sent Johnny Schmitz and cash to the Cincinnati Reds for right-hander Ewell Blackwell. The Cincinnati Reds obtained outfielder Wally Westlake and infielder Eddie Kazak from the St. Louis Cardinals in exchange for first baseman-outfielder Dick Sisler and shortstop Virgil Stallcup. Westlake was not with Cincinnati long before he was dealt to the Cleveland Indians in a cash deal. Right-handed hurler Emory (Bubba) Church was obtained from the Philadelphia Phillies by the Reds for John Wyrostek, a first baseman and outfielder, and southpaw Kent Peterson. The Reds also picked up two outfielders in cash transactions. Willard Marshall was purchased from the Boston Braves and Cal Abrams was obtained from the Brooklyn Dodgers. The New York Giants handed over \$50,000 and hurler Sheldon Jones to the Boston Braves for outfielder-third baseman Bob Elliott.

Individual Performances.—Stan Musial of the St. Louis Cardinals won the 1952 National league batting title with a .336 (unofficial) mark. It was the sixth time that "Stan the Man" had captured the title and put him within reach of the National league record of eight batting titles set by Honus Wagner. Hank Sauer of the Chicago Cubs and Ralph Kiner of the Pittsburgh Pirates tied for the home-run crown with 37 (unofficial) homers each. For Kiner it marked the seventh consecutive year that he had led or tied for the National league home-run title. Sauer also won the runs-batted-in crown with 121 (unofficial). In the American league Ferris Fain of the Philadelphia Athletics took his second straight hitting title with a .327 (unofficial) average. Larry Doby of the Cleveland Indians was top home-run producer in the league with 32 (unofficial). His teammate, Al Rosen, won the runs-batted-in contest with 105 (unofficial).

Relief pitcher Hoyt Wilhelm of the New York Giants captured the earned-run average title in the National league. He had 2.43 (unofficial). The pitcher with the best earned-run average in the American league was Allie Reynolds of the New York Yankees, who had a mark of 2.06 (unofficial). There were six 20-game winners. Robin Roberts of the Philadelphia Phillies was the only National league pitcher to enter the charmed circle with 28 victories. The American leaguers were: Bobby Shantz of Philadelphia (24), Early Wynn of Cleveland (23), Mike Garcia of Cleveland (22), Bob Lemon of Cleveland (22) and Allie Reynolds (20).

Three no-hitters were hurled during the 1952 season. Virgil Trucks of the Detroit Tigers threw two no-hitters, the first coming on May 15 against the Washington Senators and the second on Aug. 25 against the New York Yankees. The third no-hitter was hurled by Carl Erskine of the Brooklyn Dodgers. On June 19 he held the Chicago Cubs hitless in a game interrupted by rain.

The armed services interrupted the careers of some of the game's stars. Ted Williams, a captain in the marine air corps reserve, was called back to duty shortly after the season got under way. Facing a tour of duty which could carry through the 1953 baseball season, the Boston Red Sox outfielder announced it was doubtful that he would resume playing upon his discharge because of his age. If the military did ring down the curtain on the career of Williams prematurely, the records he had amassed while in major league ball still ranked him as one of the great sluggers in the game's history. Williams was not the only American league star lost to the services. The New York Yankees

lost second baseman Jerry Coleman and pitcher Tom Morgan. Bob Kennedy of the Cleveland Indians was also called into service.

In the National league the 1951 pennant winner, the New York Giants, had the services of Willie Mays, 1951 "rookie of the year," for only a short time during 1952 before he was drafted. The Brooklyn Dodgers were also hard hit by the military draft when they lost their fireballing right-hander, Don Newcombe.

All Star Game.—Shibe park, Philadelphia, was the site of the 19th annual All Star game, which the National league took by a 3-2 score. A total of 32,785 fans turned out to witness the spectacle. Hank Sauer of the Chicago Cubs provided the victory margin for the National league team with a two-run homer. Jackie Robinson of the Brooklyn Dodgers also homered for the National league. Bob Rush of the Chicago Cubs was given credit for the victory, while the losing pitcher was Bob Lemon of the Cleveland Indians. Bobby Shantz of the Philadelphia Athletics turned in a great performance in the one inning he pitched by striking out the three men he faced, Carroll (Whitey) Lockman of the New York Giants, Jackie Robinson of the Dodgers and Stan Musial of the St. Louis Cardinals. The game was delayed because of rain and after five innings of play were completed the proceedings were held up. After a 56-min. delay the umpires were forced to call the game. It was the seventh victory in the series for the National leaguers, who had lost 12 of the annual meetings.

Major League Races.—The Cleveland Indians in the American league and the New York Giants in the National league were the preseason favourites of many observers to take the pennants in their respective leagues. The Indians' pitching staff came through with three 20-games-plus winners and the hitting was good enough, but the infield play of the club was not of high enough calibre to capture the pennant flag. The New York Yankees were without the services of the retired Joe DiMaggio and it was the general belief that they could not repeat in 1952. However, on Aug. 23 the Yankees defeated the Indians to take the lead until the race was over. The Chicago White Sox were a threat for some time and the Washington Senators and Philadelphia Athletics had a knack of winning so-called big games from the leaders. In the National league, the New York Giants appeared to be stronger than the 1951 edition of their team. Their pitching looked better than in the preceding year. The Brooklyn Dodgers, however, were not to be denied. Things did not look good for the Flatbush team when they lost Don Newcombe, their 20-game winner of 1951, to the armed forces. The Giants on the other hand were hit with two crippling blows. Monte Irvin suffered a compound fracture of his right ankle during the exhibition season, and Willie Mays, the spark plug of 1951, was called to the army. The Dodgers moved into undisputed possession of first place on June 1 and never gave up the lead throughout the remainder of the season. In both leagues it was a two-club race with the Yankees outlasting the Indians and the Dodgers proving too much for the Giants. The St. Louis Cardinals made a late season move for the title in the senior circuit, but their surge was too late to prove effective.

Final Major League Standings, 1952

World Series.—The 1952 world series was a give-and-take

MICKEY MANTLE of the New York Yankees watching the ball sail over the head of third baseman Bobby Morgan of the Brooklyn Dodgers. The ball was relayed by the shortstop after Mantle tripled to centre field in the fourth game of the 1952 world series. The Yankees won the game 2-0, and took the series, four games to three

battle right down to the last out in the seventh and final game, with the New York Yankees coming home with their fourth straight series victory. It was the 19th series in which the Yankees had participated and it was the 15th time they had triumphed in the classic. Rookie Joe Black went to the mound in the first game for the Dodgers, the second relief pitcher in the history of the series to start in the opening game. His foe was Allie Reynolds of the Yanks. Black held the New York team to six hits as the Dodgers walked away with the opener by a 4-2 score. In the second game, Casey Stengel nominated Vic Raschi to tie the series. Raschi came through, giving up one run on only three hits as the Yankees won 7-1. Carl Erskine started for the Dodgers and suffered the loss. Game number three saw the scene shift from Ebbet's field to Yankee stadium. Once again the Dodgers took the lead when they scored a 5-3 win. Elwin (Preacher) Roe started for the Dodgers and went all the way, giving up six hits to gain the decision. Ed Lopat had been Casey Stengel's starting choice but the loser did not finish the game. The nip-and-tuck battle followed the pattern in the fourth game as the Yankees again tied up the series. It was Allie Reynolds against Joe Black on the mound as it had been in the first game. This time, however, Reynolds turned the Dodgers back as he racked up the only shutout of the series and the Yankees won, 2-0. Johnny Mize clouted his second home run in as many days in the game.

Perhaps the greatest game of the series was the fifth contest. The Dodgers won this one, 6-5, in 11 innings to take the lead

for the third time. Carl Erskine started for the Dodgers and went all the way. Although he was rapped for five runs in the fifth inning, he retired 19 in a row after that, to gain credit for the game. Ewell (The Whip) Blackwell started for the Yankees but was taken out for a pinch-hitter in the big Yankee fifth inning. The spree put the Yankees ahead 5-4 at the time. Edwin (Duke) Snider had homered in the top of the fifth with a man on to push the Brooklyn lead to 4-0 when the Yanks came to bat. The biggest blow of the Yank uprising was Johnny Mize's three-run homer. It was Mize's 2,000th hit in the majors, including world series and All Star games. Duke Snider came through with a run-producing single in the seventh to tie the game at 5-5. The two teams battled through the eighth, ninth and tenth innings unable to score. In the 11th, Snider (who was the hero of the Brooklyn cause throughout the series) sent a double to right-centre to give Brooklyn the deciding one-run edge. The losing pitcher was Johnny Sain. Back at Ebbets field, the New York team tied the series for the third time by edging Brooklyn, 3-2. Vic Raschi was the winner although he had to have assistance from Allie Reynolds in the eighth inning. In the seventh and final game, Ed Lopat was the starting pitcher for the Yankees while Joe Black was Brooklyn's choice. The Yankees won, 4-2, and Black was charged with the loss. Allie Reynolds, who came into the game in the fourth inning for Lopat, was the winner. Vic Raschi was called in to help Reynolds and finally Bob Kuzava hurled no-hit, no-run ball for two and two-thirds innings to save the game for Reynolds and give the Yankees their fourth straight world crown.

A total of 340,906 fans attended the seven games, and receipts totalled \$1,622,753.01. Of the total, the players' share was \$500,003.28. Each Yank full share amounted to \$5,982.65, while the

losing Dodgers' full shares were each worth \$4,200.64.

Hall of Fame.—Two new members were elected to baseball's Hall of Fame at Cooperstown, N.Y. Paul (Big Poison) Waner, who had starred for the Pittsburgh Pirates, and Harry Heilmann, an all-time great of the Detroit Tigers.

Attendance.—Attendance at major league parks fell off approximately 1,500,000 during 1952 compared with the mark set in 1951. The New York Yankees suffered the biggest drop. The St. Louis Browns showed the largest increase.

The Minor Leagues.—The pennant and play-off winners in the 43 minor leagues operating in 1952 are given in the table following. Rochester of the International league defeated Kansas City of the American association four games to three in the little world series. The Dixie series was won by Memphis of the Southern association over Shreveport, Texas league, four games to two.

Final Minor 1952 Winners

Class	League	Pennant Winner	Play-off Winner
Open	Pacific Coast	Hollywood (Calif.)	(no play-offs)
AAA	American association	Milwaukee (Wis.)	Kansas City (Mo.)
	International	Montreal (Que.)	Rochester (N.Y.)

(J. BE.)

SOVIET (dark shirt) and U.S. players jumping for the ball during the Olympic basketball match on July 28, 1952, at Helsinki, Fin. The U.S. team defeated the Soviets, 86-58

had captured the Big Seven conference crown, gained the laurels by routing St. John's of Brooklyn, N.Y., 80-63, before 11,700 fans. Clyde Lovellette contributed 33 points to the winners' total, which was a record high for a N.C.A.A. final. The University of Illinois, Urbana, which qualified for the tournament by annexing the Western conference championship, turned back the University of Santa Clara, Calif., 67-64, in the consolation game for third place.

St. John's scored one of the season's major upsets on its way to the final round, winning the right to represent the east in the play-offs by toppling the University of Kentucky, Lexington, which had run up 23 consecutive victories, by a score of 64-57 before 11,200 spectators at Raleigh, N.C.

The Kansas Jayhawks qualified for the trip to Seattle by halting St. Louis university, 74-55, in their regional final at Kansas City, Mo. Illinois set back a good Duquesne university team, 74-68, at Chicago, Ill., to advance, while Santa Clara qualified by surviving the Pacific coast sectional eliminations with the University of California at Los Angeles, the University of Wyoming and Oklahoma City university.

Kansas continued its sparkling play in the Olympic trials. The Jayhawks beat Southwest Missouri State college, Springfield, Mo., champions of the National Association of Intercollegiate Basketball, 92-65, while the Phillips 66 Oilers of Bartlesville, Okla., eliminated another Amateur Athletic union rival, the Fibber McGee and Molly quintet of Hollywood, Calif., 50-48, in the quarter-finals played at Kansas City. Meanwhile, the Caterpillar Diesels of Peoria, Ill., the A.A.U. rulers, defeated the United States Air Force All-Stars of Tinker field, Oklahoma City, Okla., 71-67, and La Salle college of Philadelphia, Pa., ousted St. John's, 71-62, in the preliminary trials in New York city. Kansas and the Caterpillars then fought their way to the

Basketball. The National Collegiate Athletic association basketball championships proved one of the highlights of the 1951-52 season, and when the long tourney at Seattle, Wash., had ended, the University of Kansas, Lawrence, was perched on top as the titleholder. Kansas, which previously

final with victories at New York's Madison Square Garden. A crowd of 11,179 saw the Jayhawks conquer La Salle, 70-65, as Lovellette scored 40 points. Kansas rallied from a 38-25 deficit to gain its victory. The Peoria quintet then subdued the Phillips 66 Oilers, 64-50. The Olympic final proved one of the season's top games, with Peoria turning back Kansas, 62-60, on a field goal in the last 50 seconds by Howie Williams, former Purdue ace. The Oilers routed La Salle, 92-58, in the consolation final.

Seven members of the Kansas team, led by Lovellette, five of the Caterpillars and two of the Oilers were among those selected for the United States Olympic squad.

Earlier in the campaign La Salle had taken honours in the national invitation tournament at Madison Square Garden, winning the big prize with a 75-64 triumph over the University of Dayton in the last round as 18,485 looked on. St. Bonaventure university furnished a surprise by upsetting Duquesne, 48-31, in the consolation final.

The Caterpillar Diesels captured the national Amateur Athletic union championship by upsetting the Phillips 66 Oilers, 66-53, in the final of the tournament at Denver, Colo. Howie Williams paced the victors with 20 points. The Hanes Hosiery team of Winston-Salem, N.C., retained the women's A.A.U. title by defeating the A.I.C. sextet of Davenport, Ia., 49-23, at Wichita, Kan.

Other major champions included Princeton, Eastern Intercollegiate league; U.C.L.A., Pacific coast; Kentucky, Southeastern; North Carolina State, Southern; Illinois, Western; St. Louis, Missouri valley; Texas Christian, Southwest; Kansas, Big Seven; Wyoming, Skyline Six; Montana State and Colorado State (tied), Rocky Mountain; New Mexico A. & M. and West Texas State (tied), Border; Marquette, National Catholic Invitation; Southwest Missouri State, National Association Intercollegiate (N.A.I.B.); Virginia Union, Central A.A. tournament; West Virginia State, Central A.A. regular season; Western Ontario, Canadian intercollegiate.

Kentucky, Southeastern champion for the 13th time, was selected as the top college five of the country in both the Associated Press and United Press polls, prior to the season's late tournaments. The Wildcats' worst setback came on Aug. 11, 1952, when they were suspended from Southeastern conference basketball for one year, the league ruling two Kentucky players ineligible because of professionalism.

The Minneapolis Lakers won professional honours by conquering the New York Knickerbockers in the finals of the National Basketball association play-offs, four games to three. The Lakers took the seventh and deciding contest on their home court, 82-65. The Wilkes-Barre (Pa.) Barons triumphed in the American league. (See also OLYMPIC GAMES.) (T. V. H.)

Basutoland: see BRITISH SOUTH AFRICAN TERRITORIES.

Batista, Fulgencio (1901—), Cuban army officer and political leader, was born on Jan. 16 at Banes, Oriente province, Cuba, the son of a truck gardener. He had little formal schooling and as a youth worked as a mechanic and tailor's apprentice. He joined the Cuban army in 1921 but remained an obscure enlisted man until he began to take part in the various uprisings of 1931-33 against the dictatorship of Gerardo Machado. With Machado's final downfall in 1933, Batista, still an army sergeant, rose to a position of national power almost overnight. The new revolutionary government appointed him army chief of staff, and in this position Batista became the virtual dictator of Cuba for the next seven years. In Dec. 1939 he announced that he would be a candidate in the presidential election the following year. His opponent,

Ramón Grau San Martín, was easily defeated and Batista was inaugurated on Oct. 10, 1940. During World War II he co-operated fully with the United States and other western powers, declaring war on Japan Dec. 9, 1941, and on Germany and Italy three days later. In June 1944 his hand-picked candidate to succeed him, Carlos Saladrigas y Zayas, was defeated by Grau, and Batista went into political retirement.

In a surprise coup staged March 10, 1952, Batista regained absolute power in Cuba by overthrowing the government of Pres. Carlos Prío Socarrás, whom he accused of corruption and dictatorial tendencies. Batista proclaimed himself chief of state and prime minister, suspended the 1940 constitution and cancelled the presidential elections which had been scheduled for June 1.

Batista was made provisional president April 4 and proceeded thereafter to strengthen his political grip on the country.

Ba U (1887—), Burmese statesman and lawyer, was born on May 26 and was educated at the American Baptist Mission school, Bassein, Burma, at the Government Collegiate school, Rangoon, at Rangoon college and at Trinity hall, Cambridge. He was called to the English bar in 1913, and in the same year was enrolled as an advocate of the chief court of Lower Burma. In 1922 he became the first full-time public prosecutor of Rangoon. After a period as a district and sessions judge at Pyapon (1923-30), he was appointed to the bench of the high court, Rangoon, and continued to hold office in that court until 1948; he was noted for his efforts to safeguard the interests of his fellow countrymen during the Japanese occupation.

Ba U took a prominent part in the drafting of the constitution of the independent union of Burma, and when the republic was proclaimed on Jan. 4, 1948, he became its first chief justice.

At a joint session of the Burmese parliament on March 12, 1952, Ba U was elected to succeed the first president of the union, Sao Shwe Thaik, in that office.

Belgian Colonial Empire. The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territory of Ruanda-Urundi administered with the Congo. Total area: about 925,907 sq.mi. Total pop. (1951 est.): 15,237,000. Areas, populations, capital towns, status and governors of the separate territories are given in the table.

History.—On Jan. 1, 1952, Léo Pétillon succeeded Eugène Jungers as governor general. To emphasize that economic activity of the Belgian Congo and of the trust territory Ruanda-Urundi was intended for their benefit, the Belgian government created independent banks for the issue of bank notes. The ten-year plan for the development of natural resources was ratified by the Belgian parliament on May 27, and the minister of the colonies was authorized to affect an extra amount of

Country	Area (In sq. mi.)	Population (1951 est.)	Capital	Status	Governor
Belgian Congo	904,991	11,332,000 (incl. 66,078 Europeans)	Léopoldville	Colony	Léo Pétillon, governor general
Ruanda-Urundi	20,916	3,905,000 (incl. 4,461 Europeans)	Usumbura*	{ Sultanates, trust terri- tory }	Claeys-Bouvaert, governor

*Principal town of Ruanda, Kigali; principal town of Urundi, Kitega.

20,000,000 fr. in 1952 for its fulfilment. Hydroelectric undertakings were pursued in the Katanga province and the linking of the Katanga and northern Rhodesian power stations was prepared. Work was also going ahead at the military base at Kamina in the Lualaba district for the defense of the uranium fields and the training of Belgian air force, airborne units and commandos. The defense of the mouth of the Congo river in the Atlantic ocean was organized at Banana, where a jetty for disembarkation and barracks were built. The monthly average of Belgian exports to its overseas territories during the first half year of 1952 amounted to 578,500,000 fr. compared with 450,000,000 fr. during the corresponding period in 1951; the monthly average for Belgian imports from its overseas territories was 822,100,000 fr. in 1952 and 836,000,000 fr. in 1951. (M. H. St.)

Finance.—Budget: Congo (1951 est.) revenue 5,125,500,000 fr., expenditure 4,963,500,000 fr.; (1952 est.) revenue 6,473,200,000 fr., expenditure 6,259,100,000 fr. Ruanda-Urundi (1951 est.): revenue 321,300,000 fr., expenditure 363,900,000 fr. Monetary unit: Congolese franc, nominally an independent currency, actually at par with the Belgian franc, and with an exchange rate (Aug. 1952) of 50.38 fr. to the U.S. dollar.

Foreign Trade.—Congo and Ruanda-Urundi: (1950) imports, 10,962,400,000 fr., exports 13,378,400,000 fr.; (1951) imports 15,419,600,000 fr., exports 19,876,900,000 fr.

Transport and Communications.—Congo and Ruanda-Urundi: Roads (1950) 71,420 mi. Railways (1950) 2,896 mi. Waterways (1949) 7,480 mi. Licensed motor vehicles (Congo only, Dec. 1951): cars 13,540; commercial vehicles 16,960.

Agriculture.—Principal products, Congo and Ruanda-Urundi (1950, metric tons): palm oil (exports) 132,039; palm kernels (exports) 85,772; maize 336,634; timber (exports) 105,233; (1951, metric tons) gum copal (exports) 14,227; cotton 45,700; coffee 35,393.

Mineral Production.—Congo and Ruanda-Urundi (1951, metric tons if not otherwise stated): copper, metal 191,959; tin, metal 16,947; cobalt 5,715; gold (fine ounces) 350,000; silver 118; (1950, metric tons if not otherwise stated) manganese ore 16,990; tungsten 93; cadmium (kg.) 29; zinc concentrates 129,869; coal 159,967; diamonds (carats) 10,147,571.

Belgian Congo: *see* BELGIAN COLONIAL EMPIRE.

Belgium. A kingdom of western Europe, Belgium is bounded southwest by France, north by the Netherlands and east by Germany and Luxembourg. Area: 11,783 sq.mi. Pop.: (1947 census) 8,512,195; (1951 est.) 8,678,000. Language (1930): Flemish (Dutch) 42.92%, French 37.56%, German 0.85%, Flemish and French 12.92%, German and French 0.83%. Religion: mainly Roman Catholic. Chief towns (pop., 1948 est.; first figure including suburbs, second figure commune only): Brussels (cap., 1,296,687; 185,112); Antwerp (chief port, 794,280; 266,636); Liège (573,176; 156,664); Charleroi (445,229; 26,262); Ghent (442,792; 166,797); Namur (215,069; 31,637); Bruges (200,850; 52,984). Ruler, King Baudouin I; prime ministers in 1952: Joseph Pholien and (from Jan. 15) Jean van Houtte.

History.—King Baudouin, who on July 17, 1951, became the fifth king of the Belgians after his father's abdication, made the first *joyeuse entrée* of his reign on May 24, 1952, by visiting Antwerp. Afterward he made his *entrée* at Liège, Ghent and Namur and it was decided that the tradition of visiting the principal town of each province should be continued the next year. The *joyeuse entrée* meant recognition of the freedom of the citizen by the highest dignitary and enabled the expression of the people's loyalty. Everywhere there was an enthusiastic reception although the division of public opinion, which was acute when King Leopold returned, was still smouldering. It flared up in Feb. 1952 when confusion took place between the palace services and the prime minister's office on the announcement that the king, who since his accession to the throne had paid no official visits abroad, had delegated his brother Prince Albert to attend the funeral of King George VI. In the house of representatives the opposition declared that the young king was not receiving adequate advice and the government was defeated on a vote on a motion of regrets.

Political.—In Jan. 1952 Joseph Pholien, the prime minister,

was compelled by his own party, the Christian Social party, to resign and Jean van Houtte became his successor. The Christian Social party, which retained a majority of 4 in the house and of 7 in the senate, felt that some ministers who had been dismissed because of their lukewarm attitude in defending King Leopold during the 1950 royal crisis might return to office to consolidate the party's unity. Changes in the economic policy were also urged. Only one former minister was reinstated, Jean Duvieusart, who became minister of economic affairs. In August, Albert Coppe, minister of reconstruction, resigned to become vice-president of the High Authority of the European Coal and Steel Community and was not replaced. In September, Pholien, who had been kept in the cabinet as minister of justice, was forced to resign because of violent protests against the reprieve of a Belgian collaborator who had been sentenced to death for cruelty in a concentration camp.

The government faced another storm in July, when disorders occurred in several Walloon battalions and the Socialist trade unions organized strikes to protest the two-year period of military service. The other member countries of the European Defense Community, in August at the Paris conference, declined to agree on a uniform term of service. The government, therefore, decided to release the Belgian conscripts after 21 months but the act providing for a two-year period was not altered and Paul van Zeeland, the minister of foreign affairs, stated that the government remained convinced of the necessity of a general 24 months' service for the organization of an adequate Atlantic defense.

Provisions of the North Atlantic treaty, the Schuman plan, the European Defense Community and the proceedings at the Consultative assembly of the Council of Europe at Strasbourg raised the problem of a revision of the definition of national sovereignty in the constitution. The government appointed a commission of members of parliament and experts in international affairs to study the question. Two Walloon Socialists introduced in the house a bill for a reorganization of Belgium on a federal basis. The committee of the house of representatives, during the preliminary examination, rejected the proposal but felt that it nevertheless ought to be discussed in public meeting; but the opinion gained ground that revision of the constitution was needed for securing the political, language and economic interests of Walloons and Flemings in a united Belgium.

International.—The charter of the United Nations, the Brussels treaty and the North Atlantic treaty further governed Belgium's foreign policy. The determination to promote international co-operation was reaffirmed when parliament ratified the treaty on the Schuman plan. On European co-operation the government and most of the political leaders were anxious to secure British partnership. The so-called small Europe (France, Germany, Italy, the Netherlands, Luxembourg and Belgium) was cautiously approached. As was pointed out by Paul Struye, the chairman of the senate, Belgium in its relations with the great powers always felt that understanding with Great Britain was an essential element of equilibrium. Completion of the economic union between the Netherlands, Belgium and Luxembourg was delayed by the prolonged ministerial crisis in the Netherlands following general elections there. Meanwhile, serious objections were raised in Belgian industrial circles to abnormal competition on the Belgian market resulting from the Netherlands policy of subsidies and differences in wages. Talks took place between industrialists of the countries and a conference of ministers met on Oct. 7.

Economic and Financial.—The index of industrial production (1936-38=100) stood at 143.4 in Jan. 1952, compared with 138.2 in Jan. 1951 and 122 in Jan. 1950. Activity decreased in

several industries, and in February cotton-weaving mills began to work part time. Van Houtte stated that there were 50,000 permanently unemployed because of the general economic situation, and 25,000 because of structural factors. He announced measures to promote new industries in the affected areas and to prospect the American markets. Difficulties resulting from the Belgian creditor position with the European Payments union were removed in June at the meeting of the Council of Ministers in Paris, when Belgium agreed to buy arms from Great Britain and France and was promised substantial U.S. "offshore" purchases. (See also EUROPEAN UNION; NORTH ATLANTIC TREATY ORGANIZATION.) (M. H. St.)

Education.—Schools (Dec. 31, 1950): elementary, infant 4,072, pupils 297,089; primary 8,732, pupils 769,968; primary, adult 282, pupils 4,054; secondary, state, lower grade 278, pupils 50,318; secondary, state, higher grade 120, pupils 57,095; Catholic 449, pupils 67,093. Teachers' training colleges: infant 39, students 2,205; elementary 81, students 9,442; secondary 39, students 1,906. Universities (1949-50) 4, students 16,425.

Finance and Banking.—Budget: (1951) revenue 73,400,000,000 fr., expenditure 68,300,000,000 fr.; (1952 est.) balanced at 70,500,000,000 fr. National debt (Aug. 1951) 246,970,000,000 fr. Currency circulation (June 1952) 100,600,000,000 fr. Gold and foreign exchange (Aug. 1952) U.S. \$1,104,000,000. Bank deposits (June 1952) 70,100,000,000 fr. Monetary unit: Belgian franc, with an exchange rate (Aug. 1952) of 139.39 fr. to the pound and 50.38 fr. to the U.S. dollar.

Foreign Trade.—(Belgo-Luxembourg Economic union, 1951): imports 127,200,000,000 fr., exports 132,564,000,000 fr. Main sources of imports (1951): U.S. 16%; the Netherlands 11%; France 10%; U.K. 8%. Main destinations of exports: the Netherlands 18%; U.K. 10%; France 9%; U.S. 6%. Main imports: machinery and vehicles 12%; raw wool and cotton 11%; grains 6%; coal, petroleum and products 8%. Main exports: iron, steel and manufactures 21%; thread and fabric 13%; nonferrous metals and manufactures 10%; machinery and vehicles 9%.

Transport and Communications.—Roads (1950): 6,754 mi. Licensed motor vehicles (Dec. 1951): cars 294,797, commercial vehicles 151,480. Railways (1951): 3,130 mi.; passenger-miles 7,300,000,000; goods, ton-miles 8,000,000,000. Shipping: (July 1951) merchant vessels of 100 gross tons and over 203; total tonnage 493,432. Navigable waterways 969 mi. Air transport (1951): passenger-miles 192,000,000; cargo ton-miles 12,085,178. Telephones (1951): 687,012. Radio receiving sets (1950): 1,548,205.

Agriculture and Fisheries.—Main crops (metric tons, 1951): wheat 512,000; barley 270,000; oats 438,000; rye 204,000; potatoes 2,016,000; sugar, raw value 267,000; linseed 20,000; rapeseed 5,000. Livestock (1951): cattle 15,000,000; sheep 124,000; pigs 1,263,000; horses 242,000; goats 55,000; poultry 15,000,000. Dairy production (1950): butter 73,000 metric tons; milk 3,452,000,000 litres. Meat production (1951) 302,000 metric tons. Fisheries (1951): total catch 56,000 metric tons.

Industry.—Industrial establishments (Jan. 1948): 248,128; persons employed 1,000,010. Fuel and power (1951): coal 29,664,000 metric tons; manufactured gas 1,728,000,000 cu.m.; electricity 9,492,000,000 kw.hr. Raw materials (metric tons, 1951): pig iron 4,848,000; steel ingots and castings 5,004,000; copper, smelter 142,000; lead 70,000; zinc 200,000; tin 8,600; aluminum 1,400. Manufactured goods (metric tons, 1951): cement 4,392,000; woven cotton fabrics 79,000; cotton yarn 106,000; wool yarn 33,000; rayon filament yarn 12,400; paper and cardboard 325,900.

Benson, Ezra Taft (1899—), U.S. marketing specialist and government official, was born on Aug. 4 in Whitney, Ida. He attended Utah State Agricultural college, Logan, Utah (1818-21) and received a bachelor of science degree from Brigham Young university, Provo, Utah, in 1926. In 1927 he was granted a master of science degree from Iowa State college, and he spent the next two years farming in southern Idaho. He was employed as an agricultural agent by the University of Idaho Extension service until 1930 when he was placed in charge of economics and marketing work for the state of Idaho. He held this position until 1937 when he took a year's graduate study at the University of California, Berkeley. He was executive secretary of the National Council on Farmer Cooperatives (1939-44), and was president of the Washington Stake, Church of Jesus Christ Latter Day Saints in Washington, D.C. (1940-44). He was appointed vice-chairman of the board of trustees of the American Institute of Cooperation in 1943. He was against federal food subsidies and believed that they were a cause rather than a preventive of inflation. The farmers regarded

him as a conservative because of his attitude toward federal assistance to agriculture. He was one of twelve members of the council of the Mormon Church. He was selected on Nov. 24, 1952, in New York city to serve as agriculture secretary in the cabinet of President-elect Dwight D. Eisenhower.

Benton, William (1900—), U.S. senator and publisher, Minn. He was graduated from Yale university in 1921. In 1929, in partnership with Chester Bowles, he founded the advertising agency of Benton and Bowles.

Benton retired from the agency in 1936, and in 1937 became vice-president of The University of Chicago, on a part-time basis. At his instance the university acquired Encyclopædia Britannica, Inc., in 1943. He financed the company, became chairman of its board and shared its ownership with the university. He launched the company into the classroom motion-picture field and served as chairman of Encyclopædia Britannica Films Inc. During this period, in collaboration with Paul Hoffman, he helped to found the Committee for Economic Development, and he was active in inter-American affairs.

Benton was appointed U.S. assistant secretary of state by Pres. Harry S. Truman on Aug. 31, 1945, and served until Sept. 30, 1947. He developed the country's first peacetime program of international information and educational exchange and took responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization.

In Dec. 1949 Benton was appointed U.S. senator from Connecticut to succeed Raymond E. Baldwin, resigned; in the Connecticut election of Nov. 7, 1950, he was returned to the senate for two more years. His first two years in the senate were marked by his campaign in behalf of a "Marshall Plan of Ideas," by his vigorous espousal of the Hoover commission recommendations on government reorganization and by his activities on behalf of small business. In 1951 he secured the adoption of the "Benton amendment" to the Mutual Security act, which instructs the administrator of that program to oppose cartels and Communist-dominated unions abroad; made proposals to strengthen anticorruption laws; and introduced a resolution calling for expulsion of Sen. Joseph McCarthy of Wisconsin.

He was the Democratic candidate for re-election to the senate in 1952, but was defeated at the polls.

Bequests, Philanthropic: see DONATIONS AND BEQUESTS.

Berlin. Capital of the German reich from 1871 to 1945, Berlin was still by 1952 the largest city of Germany. Area: 344 sq.mi. Pop.: (1939 census) 4,321,500; (1950 est.) 3,336,475. From June 6, 1945, Berlin was administered by an inter-Allied government authority consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the soviet commandant proclaimed the dissolution of the authority, Berlin was in fact divided into two opposing administrations. By Dec. 31, 1951, the three western sectors (area, 185.4 sq.mi.; pop., 1950 census, 2,146,952) were under the authority of the three following Allied commandants: Great Britain, Maj. Gen. C. F. G. Coleman; United States, Brig. Gen. Lemuel Mathewson; France, Gen. Pierre Carolet. In the soviet sector (area, 155.8 sq.mi., pop., 1950 est., 1,189,523) the civil administrator was Serghey S. Dienghin. There were also two rival German city governments and two lord majors. Ernst Reuter was *Oberbürgermeister* of the three western sectors, appointed by an elected city assembly; Friedrich Ebert was *Oberbürgermeister* of the soviet sector appointed by a meeting summoned by the Sozialistische (Communist) Einheitspartei.

History.—A peaceful end to the separation of west and east

TEEN-AGERS OF BERLIN helping to clear rubble from the streets, a compulsory duty in the soviet sector of the city

Berlin seemed as far off in 1952 as the reunification of Germany, and probably it was, since both developments depended upon Allied-soviet agreement. The soviet authorities still refrained from overt steps leading to official incorporation of the whole city within their domination; but obstruction and economic pressure were used to the utmost to weaken democratic west Berlin.

Interference with traffic on the international *Autobahn* from west Berlin to western Germany continued intermittently, and was aimed at undermining west Berlin's economic existence. The U.S. and British military patrols were prevented from using this *Autobahn*, leaving the three Allied commandants unable to do much more than protest. One of the few stands taken by the western Allies against soviet actions was when British troops (June 3-10) prevented free access to the soviet radio station in the British sector.

Isolation of west Berlin, both from the eastern soviet sector and from the German Democratic Republic was carried still further. Many west Berliners lost small holdings or allotments across the zonal border of the Democratic Republic; those among them who worked in the Communist-controlled areas were dismissed from their jobs unless they agreed to transfer their domiciles to these areas; and from June 3 both west Berliners and western Germans needed special permits to enter either the soviet sector or the Democratic Republic.

There were many kidnappings of Germans in west Berlin by agents under soviet control, but world attention was attracted to the case of Walter Linse, a member of the League of Free Jurists (July 8). As this occurred in the U.S. sector, both John J. McCloy, the high commissioner, and his successor Walter J. Donnelly protested to Gen. Vasili Chuikov, chairman of the Soviet Control commission, but without success.

West Berlin's importance as a bulwark of democracy behind the "iron curtain" was indicated by official visits from both the British foreign secretary and the U.S. secretary of state. Anthony Eden (May 29), while there, opened the English garden, and Dean Acheson laid the foundation stone of the U.S. Memorial library. Both stressed the guarantees of the western powers to defend west Berlin.

Politically, west Berlin continued to be governed by the coalition which resulted from the 1951 elections. But since the S.P.D. (Social Democratic party), though the largest single

party, failed to win an over-all majority, disagreements among the parties became more marked. The political crisis which threatened in the spring was overcome mainly because solidarity in the face of Communist pressure was essential in such a situation. Reuter was re-elected lord mayor, after a special vote of confidence (April 3).

Economically, west Berlin still faced tremendous difficulties, which largely arose from its situation. Lack of a normal hinterland and the hesitation of private capital from the German Federal Republic or abroad to invest there were serious hindrances to normal development. West Berlin, its leaders stressed, wanted orders not subventions, investments not doles. Unemployment numbered 280,000 (July), but there were still thousands more unregistered. Among the latter were many refugees from the Democratic Republic who fled because of the new suppressive measures being introduced there. Refugees who had crossed over (by Aug. 31) numbered about 53,000. They first went to various temporary camps in west Berlin where they were "screened," and the majority were then sent to western Germany. Between February and August, 10,638 youths under 24 years of age escaped to west Berlin to avoid compulsory service in the *Volkspolizei*, of the labour service of the Democratic Republic.

From time to time there were minor clashes on the sector borders between the west Berlin police and members of the Communist youth organization (F.D.J.), but no gigantic rallies in east Berlin similar to those of previous years which threatened to lead to full-scale attempts at upsetting democracy in the western sectors.

In east Berlin, where there had been no communal elections since Oct. 1946, the general political picture remained unchanged. Since practically no distinction was drawn there between executive and legislature, the *Magistrat* in that sector was assumed to be able to read and interpret the needs of the population and therefore issued decrees and orders which bore the stamp of laws.

Relations between the east Berlin *Magistrat* and the government of the Democratic Republic were very close. But as yet the eastern sector and the republic were not officially united. Just as the western occupying powers still had not recognized west Berlin as the 12th *Land* in the German Federal Republic, so the soviet occupation authorities had not given east Berlin the status of a province in the German Democratic Republic.

In both west and east Berlin, a great deal of restoration work

was going on. In the western sectors, the Kurfürstendamm was largely rebuilt, and parks and open spaces laid out. In the eastern section, the wide Stalin Allee (formerly Frankfurter Allee) was now the shop window of Communist achievements for the Germans. Large blocks of flats, in process of erection, were scheduled for occupation by the end of the year.

(J. E. Wt.)

Bermuda. Bermuda is a British colony of about 300 small islands 580 mi. E. of Cape Hatteras, N.C. Area: 21 sq.mi. Pop. (1950 census): 37,403. Chief towns: Hamilton (cap., c. 3,500); St. George's (c. 1,300). Governor in 1952, Lieut. Gen. Sir Alexander Hood.

History.—A Bermudan delegation visited London in May 1952 to discuss the disposal of the royal naval dockyard, closed in March 1951 in Bermuda. No decision was announced. Among suggestions made was the opening of the dockyard area to light industries to counterbalance the existing dependence of the colony upon the tourist trade. Steps taken by the government with a similar object in view were the purchase of a motor fishing boat to carry out a five-year program of commercial fishery research and the hiring of two Danish motor fishing vessels to investigate the possibility of organizing deep-sea fisheries.

An indication of the prosperity of the colony was to be seen in its dollar earnings. A debt at the end of World War II to the sterling dollar pool of \$4,358,000 had increased to \$20,412,000 by the end of 1949; but by mid-1952 this debt had been converted into a surplus of more than \$1,000,000.

Education.—Schools (1951): infant 1 (maintained); primary 19 (1 aided, 18 maintained); secondary 4 (3 independent, 1 aided); vocational 1 (for girls; aided); tridepartmental (preprimary, primary, secondary) 5 (1 independent, 4 aided); bidepartmental (primary, secondary) 1 (aided). Pupils enrolled: primary 6,700; secondary 716; vocational 216.

Finance and Trade.—Monetary unit: Bermuda pound, at par with sterling. Budget (1951): revenue £2,368,262; expenditure £2,076,797. Foreign trade (1951): imports £10,628,280; exports £49,000; re-exports £1,312,707. Principal exports: lilies and lily bulbs. Tourists (1951): 92,066; estimated receipts from tourist industry £8,204,000. (Jo. A. HN.)

Betting and Gambling. Statistics would indicate that there was more gambling in the U.S. in 1952 than in previous years. Informed opinion, however, held that actually there was far less gambling.

Other things being equal, there is always much more money bet in an election year, such as 1952. There were the usual large bets on the U.S. presidential election, and, it may be assumed, on congressional, state and local elections. The betting on the presidential election, however, was far less than it was in 1948, when big gamblers lost heavily by betting as much as 20 to 1 on Thomas E. Dewey. In 1952 they did not trust the advance surveys, and while the early odds on Eisenhower were 8 to 5 (which accorded with the several surveys), these odds dropped steadily, to 7 to 5 two weeks before the election; 6 to 5 a week before; and even money the day before.

The Associated Press's annual survey of horse race betting through pari-mutuel machines (legal) showed \$1,939,162,662 bet during 1952, 19% more than in 1951. Attendance at race tracks was 27,261,601, which was 12% more than in 1951. However, it had always been estimated that anywhere from \$5 to \$8 is bet through bookmakers away from the tracks for every dollar bet at the tracks. Far fewer bookmakers were operating, the smaller ones having proved unwilling to expose themselves by registering and paying a \$50 U.S. tax (which went into effect Nov. 1, 1951), but fearful of operating without paying it. This fact was the basis for the estimate of decreased gambling.

Nevada, the only state that licenses nearly every form of

gambling, showed approximately a 10% increase over 1951. Las Vegas, Nev., continued to develop as a combined pleasure resort and gambling centre, the rapidity and scale of its development being comparable to those of Monte Carlo in the 1870s; the most expensive attractions in the theatrical world were brought in to attract moneyed visitors. But Miami, Fla., which had previously (in its season) been the most popular resort for gamblers, saw far less gambling of all sorts, chiefly because of police pressure on bookmakers and gambling rooms; the decrease in gambling there was estimated to be 50% or more.

Basketball, which among athletic games had most appealed to gamblers prior to 1951, continued in their disfavour. Several cases had been exposed in 1951 where college players accepted bribes to play badly; additional cases were exposed in 1952. Betting on football, baseball and boxing was reduced only to the extent that bookmakers were unavailable. (A. H. MD.)

Great Britain.—In consonance with the steady reduction in personal expenditure on luxuries and nonessentials experienced in recent years, 1952 saw a further falling off in the total volume of betting and gambling. There was an increase in the number of unit bets made, but this was more than counteracted by the smaller value of the individual bet. One marked exception to this trend, was, however, betting on football pools, which, despite the heavy impost of 30% levied by way of pool betting duty, showed an increase of both the number of betters and the volume of the pools.

As regards betting on horse racing, on which no impost was levied, the takings of the totalizator showed a fractional increase, but there was a falling off in the volume of betting with bookmakers, with the result that betting on horse racing generally showed a decline over the year. Greyhound racing continued to feel the impact of the pool betting duty of 10% imposed on totalizator takings, and of the licence excise duty of, on the average, about 5%, levied on bookmakers' takings, the joint effect of which resulted in the cessation of totalizator operation on a number of tracks and in a substantial diversion of stake money to the bookmakers. In total, the volume of on-course betting on greyhound racing was roughly maintained at the 1951 figure, with a slight increase in off-course betting.

Whereas the figures of betting with the totalizator (both horse and greyhound), with bookmakers on greyhound tracks, and on football pools, could be given with some exactitude, the volume of business effected with bookmakers on horse racing remained a matter of some surmise. Thus the Royal Commission on Betting, Lotteries and Gaming 1949-51, estimated the turnover at from £195,000,000 to £220,000,000, whereas the churches' committee on gambling placed it as high as £373,000,000. If the mean of these estimates is taken, and an addition of £25,000,000 made for the illicit business carried on by street bookmakers, a total of £315,000,000 is arrived at. This figure being accepted, the total turnover for all classes of betting and gambling in 1952 was about £540,000,000; viz., horse racing £341,000,000; greyhound racing £132,000,000; football pools £62,000,000, and other forms of gambling £5,000,000, which, if the fall in the purchasing power of the pound was considered, represented a considerable drop from the 1951 figure. The personal expenditure on betting and gambling represented less than 1% of the total cost of all items of personal expenditure.

The revenue derived directly by the exchequer from betting dues was about £28,000,000. Indirectly, there was the revenue accruing from postal services, income tax paid by promoters and by the 77,000 full-time and part-time employees of the betting industry, and from entertainment tax, in all aggregating about £14,000,000. Thus, directly and indirectly, the state received a total of more than £42,000,000 in revenue from betting and gambling in 1952.

France.—In France during the same period £44,250,000 were bet with the totalizator, of which £19,750,000 were bet on-course and £24,500,000 at cash betting offices; in total, an increase of 29% on 1951. (J. R. CH.)

Bevan, Aneurin (1897–), British politician, was born at Tredegar, Monm., Eng. After studying at the Central Labour college, London, he threw himself into local politics, first as a member of the Tredegar urban district council and, in 1928 as a county councillor.

He was elected to the house of commons for Ebbw Vale, Monm., in 1929. Throughout World War II he was a bitter and unrestrained critic of Winston Churchill's coalition government. Elected to the Labour party executive in 1944, he headed the poll in the elections to the executive every year from 1946.

As minister of health in Clement Attlee's government of 1945, Bevan was responsible for setting up the national health service as well as having charge of the housing program. He became minister of labour and national service in Jan. 1951, but in April resigned from the government because he disagreed with the scale of rearmament budgeting and with the apportionment of the burden of expenditure among the different social classes.

On Jan. 31, 1952, in a debate in the house of commons, Bevan attacked the government's economic policy as being unrealistic and criticized treasury control. When the new National Health Service bill containing proposed economies of £20,000,000 was formally introduced on Feb. 1, he issued a statement denouncing the bill and claiming "if this is carried into law it means that the free health service is dead." On Feb. 26 he expressed the fear that, to the U.S., the war in Korea was "not a United Nations operation to discipline an act of aggression but an intervention by the United Nations in a long-distance attack on Communism" and that such an attitude, if endorsed by Great Britain, would mean the end of independent British foreign policy. At a meeting in Jarrow on March 16 Bevan alleged that the U.S. was arming Chiang Kai-shek to enable him to resume the civil war in China, and at Dalry, Ayrshire, on June 14, he said that a truce could be secured in Korea immediately if the U.N. informed Communist China that they recognized the Chinese revolution as an accomplished fact.

Bhutan. An Indian-protected state on the borders of Tibet. Area: c. 18,000 sq.mi. Pop. (1951 est.): 300,000, chiefly Bhotias. Language: dialect of Tibetan. Religion: mainly Buddhist. Capital: Punakha. Ruler: Maharaja Jigme Dorji Wangchuk.

History.—A new ruler was installed on Oct. 27, 1952, in this world's least visited and most inaccessible state. The new maharaja succeeded his father Jigme Wangchuk who died on March 30. The accession ceremony took place with much pageantry at Paro, in the western part of the country in the presence of B. Kapur, the Indian political agent at Gangtok, Sikkim. To reach Paro from Gangtok involves a nine-day trek on foot and by pony. In the treaty of Aug. 8, 1949, signed at Darjeeling, Bhutan agreed to follow Indian advice in foreign affairs; India agreed to increase the annual subsidy from Rs. 200,000 to Rs. 500,000 and returned to Bhutan 32.81 sq.mi. of territory known as Dewangiri.

Bicycling: see CYCLING.

Billiards. Willie Hoppe of Drexel Hill, Pa., and Willie Mosconi of Havertown, Pa., retained their world billiard laurels in 1952.

At San Francisco, Calif., after winning five in a row, Hoppe

WILLIE HOPPE demonstrating a three-cushion massé shot at San Francisco, Calif., where he was defending his three-cushion billiards title in 1952. He defeated Kinrey Matsuyama of Japan on March 22, retaining the world championship for the 12th time

was beaten in succession by Ray Kilgore of San Francisco, 50-47, and Joe Procita of Los Angeles, 50-41, and Kinrey Matsuyama of Japan took the lead. Hoppe, after defeating Arthur Rubin of Brooklyn, N.Y., then met Matsuyama in the deciding match. Hoppe beat the Japanese, 50-37, to become champion of the three-cushion world for the 12th time.

Mosconi clinched his 10th pocket championship in 11 years by registering 8 consecutive triumphs. His only setback came at the hands of Irving Crane of Binghamton, N.Y., the runner-up in the final match of the tourney at Boston, Mass.

En route to the title Mosconi established a pair of world records, one a high run of 121 in one inning and the other a low game of two innings. Both marks came in his 150-2 triumph over George Chenier, champion of Canada.

In the three-cushion event, Masako Katsura of Japan, first woman to compete in a world billiard tourney, won four victories in nine contests and seventh place in the field of ten.

Bill Sims of Georgia won the intercollegiate pocket championship and Paul Ridout of Wisconsin the three-cushion title. Dan Fader of Cornell captured straight-rail honours. The events were held at Ohio State university, Columbus.

Telephonic tournaments determined the team champions, with Michigan State first at three cushions, Michigan Normal at straight rail and Wyoming in the pocket division. Minnesota finished ahead in the coed pocket test and Sondra Bilsky of Purdue topped the individual scorers.

Gerald Piccirelli of Worcester, Mass., took the Boys' Clubs of America senior national championship and Robert Legg of Princeton, Ind., successfully defended his junior national crown. The finals were held in New York city. (P. BR.)

Biochemistry. Important chemical investigations were reported in 1952 in two areas of popular interest—viruses and cancer. The work with cancer tissue represented a continuing effort along lines developed over many

years. The chemical studies of virus reproduction, however, were newer. Both of these problems are different aspects of a fundamental problem in biology; *i.e.*, how the cellular processes are controlled to produce a specific molecular structure. The mechanisms which determine whether a normal cell or a cancer cell or even a virus will be produced by a given cell were still unknown. The close interrelationship of the problems of cell reproduction, cancer and viruses was indicated by the fact that viruses had been implicated as the causative agents of some cancer.

Viruses.—Most of the revealing discoveries on viruses had come from work done with a specific group of viruses which attack bacterial cells. These viruses, or bacteriophages, had been isolated in a relatively pure state and found to consist of roughly equal portions of nucleic acid (the desoxyribose type) and protein. There are three notable facts about the composition and structure of these viruses: (1) Electron microscopy revealed that some of these virus particles have a tadpole or spermlike shape. The occurrence of a specific form is remarkable when it is realized that these particles have a diameter of approximately 10^{-4} mm. (2) It was found that the tail and the external coating of the head of these particles are composed of protein, while the nucleic acid is apparently localized within the head. (3) A detailed investigation was made of the composition of the nucleic acid of certain of the *Escherichia coli* bacteriophages. Although the nucleic acid possesses most of the properties of ordinary desoxyribonucleic acids, it was found to lack a nitrogenous base, cytosine, which is found as a component of every other known desoxyribonucleic acid including that of the host bacteria. It was discovered that the virus contained, instead, a nitrogenous base which was identified as 5-(hydroxymethyl)-cytosine. This compound was found in uninfected *E. coli* and it was suggested that the formation of this compound is a vital step in rearranging the synthetic pathways of the host cell for the production of virus.

Although no metabolic activity of any sort had been found in highly purified and concentrated bacteriophage preparations, these particles when added to a suspension of susceptible bacteria in a suitable medium cause the destruction of the host cell and the liberation of several hundred new virus particles. The mechanism by which these particles reproduce had not been determined, but several important biochemical facts were established: (1) It was shown that little or no specific materials are contributed by the host cell to the new virus. The nutritional requirements for virus synthesis are essentially those for normal cellular growth. (2) Apparently the virus particle is disrupted as it penetrates into the bacterium. The technical simplicity of the bacteriophage system made it possible to prepare isotopically labelled virus. This labelled virus was used to trace the events occurring during the reproductive process. Measurements of the distribution of the isotope in the progeny virus showed that the infecting virus particle does not survive the reproductive process intact. It was also shown that the portion of the virus particle which does get into the cell is no longer capable of infecting new bacteria. (3) It is significant that the material originally contained in the parental virus is not specifically contributed to the viral offspring. The parental material which is found in the progeny appears to be largely, if not entirely, the result of the non-specific incorporation of fragments of the parent virus into the new virus. The above conclusion rested on several different experimental approaches. It was found, for instance, that neither ultra-violet light nor X-ray irradiation of the labelled parent virus affected the contribution of parent material to the progeny, even though these types of irradiations

destroy the genetic portion of the bacteriophage. This must mean that the material passed from parent to offspring does not play an essential role in the reproductive process. These three findings were of major importance and had to be considered in any further experiments on the mechanism of virus reproduction. It was expected that information obtained in the bacterial virus system would be applicable to the animal viruses and might lead to a rational approach to the treatment of human virus diseases.

Cancer.—Considerable progress was made along three different but fundamental biochemical approaches to the cancer problem. More than 20 years earlier, it had been discovered that certain polycyclic hydrocarbons, such as benzpyrene or methylcholanthrene, could cause cancers in animal tissues. Modern techniques had now been used to investigate the manner in which such compounds cause cancer. Current work suggested that these carcinogenic compounds undergo additional reactions with cell constituents. One of the early reactions of the hydrocarbon molecule when in contact with the tissue is hydroxylation. Quantitative evidence was also obtained on the length of time that these carcinogenic compounds remain in certain tissues which eventually develop cancers. It was hoped that this type of information would eventually give a clue to the crucial reactions which are occurring. In this connection it should be noted that some characterization of the proteins of rat liver which react with the carcinogenic azo dyes had been achieved.

Interesting results were obtained on the effect of hormones on cancer development. It was reported that long continued administration of pituitary growth hormone to rats resulted in the production of a wide variety of neoplasms, particularly in the endocrine organs. Similar treatment of hypophysectomized female rats did not produce cancer. Apparently the presence of the pituitary gland and its secretions are necessary in the production of the neoplasms resulting from the administration of growth hormone. These findings established for the first time a relationship between regulation of growth and neoplastic changes. Although the primary metabolic deviation of neoplastic tissue from normality remained obscure, efforts had been concentrated on finding an agent which would block the growth of a tumour by competing with a metabolite in an essential cell process. It was found that certain mouse tumours are inhibited by the compound 8-azoguanine but the mechanism of this inhibition remained obscure. Some new promising leads resulted from the finding that certain compounds having two or more reactive groups are capable of reacting within the cell with a constituent essential for the process of cell division. Such compounds as trimethylamine have tumour-inhibitory activity against Walker 256 carcinoma in rats. Unfortunately, as therapeutic agents these compounds share with others the property of directing their action against dividing cells in general rather than against tumour cells in particular.

The relationship between viruses and cancers received considerable attention. It had been known for some time from the work of John J. Bittner that mammary carcinoma in mice is caused by a filterable agent which is transmitted from one generation to another through the milk of nursing females. Recently small spherical particles having a diameter varying from 20 to 200 m μ were visualized with the aid of an electron microscope, in samples of milk obtained from nursing mice known to carry the mammary carcinoma agent. Similar spherical particles were also found in tumour extracts or in cells cultured from mouse mammary carcinomas. Injection of purified preparations of such particles had caused mammary carcinomas in susceptible mice.

An important recent discovery was the presence of particles in human milk. Although the true nature of these particles remained obscure, the presence of these particles was roughly

correlated with a history of cancer in the donor's family. Further work was needed to clarify the significance of this finding.

Carbohydrates.—A novel mode of hormone action on enzymes was revealed by the studies on glycogenolytic agents, *i.e.*, hormones which cause the breakdown of glycogen to glucose. It was found that the rate limiting step in the enzymatic conversion of glycogen to glucose was that caused by the action of the enzyme phosphorylase. This enzyme catalyzes the formation of glucose-1-phosphate from glycogen. Epinephrine (adrenalin) and similar compounds were found to possess the power of increasing the activity of this enzyme. In vitro measurements demonstrated that this agent preserved phosphorylase activity, and could restore this activity when it had fallen to low levels in the tissue. An increase in the concentration of active phosphorylase in liver by glycogenolytic agents was also demonstrated in vivo. These experiments indicated that the amount of active phosphorylase in liver is balanced by inactivation and resynthesis of the active form. This balance is under hormonal control since minute amounts of epinephrine can cause a large increase in active phosphorylase in liver slices. (See also PHYSIOLOGY.)

Birth Control. Population increases, the result of marked and widespread lowering of death rates since 1932, were reported by the United Nations in a population summary during 1952. The year also marked increasing acceptance on an international level of the need to plan human birth in relation to available supplies of food and other vital resources.

International.—Abraham Stone, vice-president of the Planned Parenthood Federation of America, returned during the year from India where he had established a pilot project in the rhythm method of birth control under auspices of the Indian government and the World Health organization. The clinical studies that Stone initiated in New Delhi and the states of Mysore, Madras and West Bengal continued under the supervision of two family-planning specialists, recommended by the federation at the request of W.H.O.

The first World Conference on Planned Parenthood to be held in the far east took place in Bombay, India, Nov. 24-Dec. 1, 1952, initiated by the International Committee on Planned Parenthood whose headquarters were in London. Physicians, demographers and scientists from Asia, Europe and the U.S. met to study social, economic and cultural factors in relation to population problems; to exchange information and views on planned parenthood programs in different countries; to stimulate social and biological research in human reproduction and to encourage the formation of national planned parenthood organizations. The conference, which was held under the auspices of the Indian Family Planning association, had Lady Rama Rau, association president, as its chairman. Mrs. Margaret Sanger, founder of the birth-control movement, who spearheaded the establishment of the International committee in 1948, was director of the American division of the conference.

The first international birth control publication, *News of Population and Birth Control*, was issued in January. Published

monthly in New York, N.Y., at the request of the International committee, its 9,000 readers included government officials and key lay and professional leaders in 65 countries.

Research.—The urgent need for simpler and less expensive methods of fertility control led to the federation's establishment of the position of research director, and the appointment of Paul Henshaw, an experimental biologist, to the post, in order to expedite, co-ordinate, conduct and promote research in the field of fertility and sterility. Henshaw carried out a survey on the potentialities on the physiologic control of fertility, which revealed that the principle of such control could be regarded as established, based on the large amount of published literature in this field. The study also showed that two types of further research were needed: (1) practical studies to establish minimal doses, the most effective methods of treatment and the standardization of treatment materials at low cost; and (2) basic studies to develop still more suitable methods.

U.S. Services.—The Planned Parenthood Federation of America was, in 1952, the national agency and clearing house for 11 state leagues and 91 local committees. Birth control clinics numbered 519. These services were in 274 public health departments, 48 hospitals and 175 extramural clinics, and there were 22 referral services. Of the 196,604 yearly total of patients visiting birth control clinics in 1951, the majority, or 189,658, were served in extramural clinics sponsored by federation affiliates. The seven states which included birth control in their public health programs were Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina and Virginia. The known infertility clinics in the country providing diagnosis and treatment of childless couples were 66, of which 13 were under the auspices of the Planned Parenthood federation. (M. SR.)

Birth Statistics. It was estimated that there were 2,161,000 births in the United States during the first seven months of 1952, so that the birth rate, on an annual basis, was 23.9 per 1,000 population. The rate for the same period of 1951 was 24.1 per 1,000. There were, altogether, 3,758,000 births registered during the whole of 1951, but an allowance for unregistered births brought the figure to 3,833,000; the corresponding birth rates per 1,000 population were 24.5 and 25.0 respectively. A decade earlier, in 1941, the estimated total live births, with an allowance for those unregistered, was 2,701,000, and the birth rate 20.3 per 1,000 population.

In connection with the census of population taken in the United States on April 1, 1950, a test of the efficiency of birth registration was made by comparing the number of infants under three months old who were enumerated with the birth records on file for the period Jan. 1 to March 31, 1950. It was found that 97.8% of the births were recorded during this period, compared with 92.5% observed in a like test conducted in conjunction with the 1940 census. For the white births, 98.5% were recorded in 1950, a rise of 4.5% since 1940; for nonwhite births, 93.4% were recorded, 11.4% more than in 1940. Only Connecticut showed that 100% of its births were recorded in the 1950 test. There were 23 states with 99% or more of their births recorded; this category included such populous states as California, Illinois, New York and Pennsylvania. Lowest on the list was Arkansas, where only 88.1% of the births were recorded.

Provisional reports from Canada, including Newfoundland, covering the first six months of 1952, showed a 2% increase over the same period of 1951. During the whole of 1951, Canada had about 382,000 births and a rate of 27.2 per 1,000 population. In contrast with this Canadian experience, the record for urban communities in England and Wales during the first eight months

of 1952 showed a 4% drop in births from the same period of 1951. During the whole of 1951, England and Wales recorded 679,497 births, the rate being 15.5 per 1,000 population. Among the other English-speaking countries, the birth rates per 1,000 in 1951 were: Scotland, 17.8; Northern Ireland, 20.8; Europeans in the Union of South Africa, 25.5; Australia, 22.9; and New Zealand (Europeans), 24.4. In construing these and other international comparisons of crude birth rates, such as those cited, account must be taken of differences between countries in their proportions of total population at the reproductive ages, the ratio of males to females at these ages, the level of the marriage rate, the ages at marriage and the duration of existing marriages.

Birth records were lacking or incomplete for large populated areas of the world, principally Asia and Africa, so that only a very rough estimate could be made of the total birth rate. For the period 1946-48, the birth rate for the world was estimated to lie between 35 and 37 per 1,000 population (United Nations, *Population Bulletin*, no. 1, Dec. 1951, p. 3). The rate was estimated to lie between 40 and 45 per 1,000 for all of Africa and all of Asia outside of Japan and the U.S.S.R. Japan had a birth rate of 31 per 1,000, while the U.S.S.R., both in Europe and in Asia, was said to have a rate of 28 per 1,000. The rate for southern Europe was placed at 23 per 1,000, while that for northwest-central Europe was lowest of all, 19 per 1,000. In America the rate north of the Rio Grande was 25 per 1,000, but south of the Rio Grande it was as high as 40 per 1,000. For Oceania the birth rate was 28 per 1,000 in 1946-48. Compared with a decade earlier, 1936-38, the recent birth rates were higher in America north of the Rio Grande, Oceania, Japan and northwest-central Europe. In the U.S.S.R. the birth rate had fallen. In all other areas, for most of which birth data were very fragmentary, the birth rate seemed not to have changed.

Among the European countries with birth rates of less than 20 per 1,000 population in 1951 were Austria, 14.6; Belgium, 16.1; Denmark, 17.8; France, 19.4; Federal Republic of Germany, 15.7; Italy, 18.1; Norway, 18.5; and Sweden, 15.6. On the other hand, birth rates of 20 or more per 1,000 population were recorded for Finland, 22.9; the Netherlands, 22.3; Portugal, 24.1; and Spain, 20.1. Especially high birth rates for 1951 were found in Costa Rica, 47.6; Guatemala, 52.1; and Venezuela, 45.6. Mexico had a rate of 44.6 per 1,000 in 1951.

In a survey of fertility trends and differentials in the United States, C. V. Kiser reviewed the work of P. K. Whelpton (*Journal of the American Statistical Association*, March 1952). Whelpton's findings showed that the upswing in the marriage rate and in the rate of first births had contributed materially to the recently rising crude birth rate. However, the same influences made it appear unlikely that the postwar level of the crude birth rate could long be maintained. The findings indicated, also, that there might possibly be a small and perhaps temporary change from the long term decrease in the average size of family, as measured by the average number of births per woman of completed fertility. Kiser surveyed changes since 1940 in the ratio of the number of children under 5 years of age to the number of married women of childbearing age. These ratios, which measure fertility trends, had generally increased since 1940, with the rises tending to be relatively greatest among those population groups that initially had the lower ratios. For example, the ratios rose more rapidly in urban places than in rural-farm places, in the northeast than in the south, and among the white population than the nonwhite population. As a result, there was a reduction in the fertility ratios among various categories within the nation.

A survey of the seasonal pattern of births for the United

States as a whole showed, in the absence of unusual circumstances, a peak in their frequency in August or September and then a rather gradual decline to a low in the following April or May; there was generally a minor peak in February or March (*Statistical Bulletin* of the Metropolitan Life Insurance company, July 1952). During the last decade, this pattern was interrupted by the impact of war. Thus, the 1942 peak fell in September and October, and the 1943 peak in January and February; the first peak might be associated with the entry of the United States into World War II in Dec. 1941. The November peak in 1946 was a result of the return of the armed forces to civilian life shortly after the close of the war. The general seasonal pattern in births was evident again from 1948 to 1950. However, the outbreak of war in Korea in June 1950 led to a peak in births in April and May 1951, these being conceived shortly after the hostilities began. Within the United States in 1948-49, a period not influenced by war, it was found that the seasonal variation in births was smallest in the northeast and the west and greatest in the south. Blind, Education of the. The year 1952 marked the centenary of the death of Louis Braille, the blind Frenchman who devised the Braille system of reading and writing for the blind. During the year numerous commemorations in his honour were held in many countries.

The second important international event was the convening of the International Conference of Educators of Blind Youth, at the Institute for the Blind, Bussum, Neth., July 25-August 2, with representatives present from 34 countries. The program of the conference consisted of a consideration of the general educational problems of blind youth, and resulted in a summary presentation of minimum standards for their education in the following fields: (1) educational and social needs of the pre-school blind child; (2) educational and social needs of the additionally handicapped blind child; (3) needs of the average blind child of school age; (4) needs of the blind child of superior intelligence; (5) needs of the blind child in the field of educational psychology; (6) needs of the blind child in physical education; (7) needs in continued general education for blind youth; (8) social needs of blind youth in a seeing world; (9) provision of textbooks, special apparatus and general educational media in schools for the blind; (10) co-operation of teaching, nursing and domestic staffs; and (11) co-operation between the responsible authority, the parent and the school in the education of the blind child.

As a culmination of the several international and regional conferences on world Braille uniformity sponsored by the United Nations Educational, Scientific and Cultural organization, the World Braille council was organized in Dec. 1951 as a permanent body to be attached to U.N.E.S.C.O. as an advisory committee, and was directed to include in its program the consideration of music notation, mathematical and scientific symbols, the compilation of an international catalogue of Braille publications, the establishment of regional councils to deal with the development of contracted Braille forms for individual languages and assistance in the co-ordination of uniform Braille systems for the African and southeast Asian languages.

In response to recommendations by the Rehabilitation unit of the United Nations, studies in the special training of the pre-school blind child and research into general educational problems of the blind were undertaken by U.N.E.S.C.O., and the World Health organization agreed to make research into the special

BLIND BOY SCOUTS building a dog kennel as part of a course in pet care given at the New York Institute for the Education of the Blind, New York city, in 1952. The boy at right is shown using a Braille ruler

sense of orientation possessed by the blind with a view to its development through training. In the field of general rehabilitation of the blind, the United Nations provided six fellowships and five scholarships to students from the less-developed countries wishing to study modern methods of rehabilitation of the blind, and sent experts in the field of the blind to advise the governments of Ceylon and Italy. A demonstration centre for the blind was set up in Egypt under the sponsorship of the United Nations, which was provided with a Braille printing plant and special equipment for the use of the blind, with a view to making this a regional centre which would later serve all of the Arabic-speaking countries of the area. Plans were also undertaken to supply a Braille printing plant to Turkey through the resources of the United Nations, while projects were formulated for the establishment of printing plants in several other countries, such as Pakistan, Cuba and Japan, under the sponsorship of their individual governments or local philanthropic agencies interested in the welfare of the blind.

Reported statistics on the incidence of blindness among children of school age throughout the world continued to be inaccurate and incomplete. Of 23 countries reporting (mostly in North America, Europe and the British Commonwealth and colonies) there were about 650,000 blind children, of whom 600,000 alone were in India, 12,000 in Japan and 10,000 in the Union of South Africa. In the United States, as of Jan. 7, 1952, there were 6,970 children reported as being in attendance in the 54 residential and 34 public-school classes for the blind. In addition, approximately 8,000 partially visioned children were in attendance in 248 public-school sight-saving classes in the United States during the 1951-52 school year. In addition, several hundred blind children and an unknown number of partially visioned were being educated in the regular public schools along with their seeing classmates.

One new cause of blindness had developed into serious pro-

portions after 1947. Retrolental fibroplasia—a fibrous condition which develops behind the lens of the eye—was being reported in 8% to 15% of premature births, particularly in those under three pounds. Prior to 1950 the blind school populations in the United States had been decreasing. After that time there had been a total increase of 1,213 pupils or 21%. Like conditions, in somewhat lesser degree, were noted in England, Canada and other countries where medical science was more advanced in the saving of prematurely born infants.

Several important educational conferences were held in the United States during 1952, including two meetings on the education of the slow-learning blind child, a special meeting of principals of schools for the blind and the second simultaneous convention (Louisville, Ky., June 29-July 4, 1952) of the American Association of Instructors of the Blind (founded in 1858) and the American Association of Workers for the Blind (founded in 1898), the two oldest national associations for the blind of North America. (F. E. D.)

Blood, Diseases of the. During 1952 a quickening of interest developed in the disorder known as idiopathic thrombocytopenic purpura (ITP). In this condition excessive bleeding occurs from mucous membranes (nose, gums, vagina, etc.) and a variable degree of purpura; *i.e.*, purplish spots of the skin and little blood spots called petechiae. The condition of purpura had been known for centuries; only recently had some order been established in the rather chaotic jumble of conditions in which purpura occurs. Some cases are the result of such well-defined causes as leukemia and other severe disturbances of the blood-producing centre; *i.e.*, the bone marrow. Others are of unknown nature and are accompanied by a lack of production of platelets from their precursors in the marrow, the megakaryocytes. This type is idiopathic. Recent studies had indicated that some cases are acute and self-limited whereas others are chronic. The acute cases often develop in the wake of an acute infection, or an exanthematous disease of childhood such as chicken pox or after certain drugs (sedormid, quinidine, chloromycetin). Almost always they have a relatively short course of a few months or less and become completely well. In contrast with the chronic cases, the operation of splenectomy (removal of the spleen) is not usually either advisable or necessary. The chronic cases go on year after year, with ups and downs, and at times have crises of active bleeding. Splenectomy in the chronic cases, although usually curative, may sometimes have no effect.

R. S. Evans postulated that ITP had a similar mechanism to that of acquired haemolytic anaemia, in that he believed that the patient with the disease had developed an antibody attacking his own platelets. W. M. Harrington went a step further. He actually injected blood from a patient with ITP into normal persons and demonstrated a severe drop in platelets in some. This indicated the presence of a substance (? antibody) in the blood of certain patients with ITP. The reverse experiment (*i.e.*, the injection of large quantities of normal platelets into the blood of patients with ITP) indicated a rapid destruction of the introduced platelets, thus indicating similar conclusions. What the humoral substance is and where it acts had eluded observation although a platelet antibody had actually been demonstrated in some cases. Previous studies pointed to the more or less mysterious organ the spleen as the site either of increased platelet destruction or of a substance which inhibited platelet formation by the bone marrow megakaryocytes. The evidence for platelet destruction by the spleen had become less and less valid but there still remained the possibility that some sort of "bad humour" might reside in the abnormal spleen of some cases. The dramatic results of removal of the

spleen had emphasized this possibility.

There was in 1952 a renewed interest in the whole subject of the blood platelets, resulting in many studies of their physiology, chemistry, methods of preparing platelet suspensions, methods of administering platelet transfusions, etc. Not only do many otherwise useful chemicals and drugs attack the bone marrow of susceptible persons and result in severe thrombocytopenia (platelet lack), but the atomic bomb may do the same. One of the chief causes of death in the Hiroshima and Nagasaki disasters was outspoken bleeding associated with low levels of blood platelets developing after exposure of the bone marrow to the large dosage of gamma-rays.

In 1952 leukemia remained the foremost problem in haematology. Numerous chemicals (nitrogen mustard, urethane, aminopterin, triethylenemelamine, etc.) had been introduced during the past few years for treatment. They were found to have transitory effects in some cases, and rather prolonged effects in others. During 1952 triethylenemelamine (TEM), a nitrogen mustardlike drug which could be given by mouth, proved of distinct benefit. It was found particularly useful in chronic lymphocytic leukemia where small doses given weekly or at greater intervals could often maintain patients in a completely normal state for long periods of time. This drug was also useful in certain cases of Hodgkin's disease and chronic granulocytic leukemia but was of little if any value in acute leukemia. No case of leukemia had been cured by a chemical, however potent, although remissions certainly had occurred and indicated that the relentless trend of this dread disease could be reversed.

The fundamental problem in leukemia is not so much the matter of treatment but causation. If the cause were only known, then preventive measures could perhaps be tried. Some cases of leukemia develop after long continued X-ray exposure—as in radiologists. Others appear to have developed after one single exposure of a high dosage of X-rays (gamma-rays) as at Nagasaki and Hiroshima, Jap. Heredity may be a factor in some cases, but the factor of heredity appears to be of far less importance than other causes. One of the postulated ones is virus infection. Fowl leukemia is definitely caused by a virus. Ludwik Gross was able to transmit leukemia in a previously nonleukemic strain of mice by inoculating leukemic material early in life. He concluded that mouse leukemia was caused by "vertical transmission"; i.e., from one generation to the next by a virus which could pass through the placenta and could then lie dormant for months in the infected host. Finally, leukemia might develop several months or a year after inoculation; i.e., when the mice were "middle-aged." Gross postulated that a similar situation was possible in humans.

Although sickle cell anaemia was supposed to be limited to Negroes, the recent finding of sickle cell trait and anaemia in isolated communities of Greece where no admixture of Negro blood seemed possible had brought this point into question. More and more cases of sickle cell anaemia were being reported in white people, particularly from Mediterranean countries and in Mediterranean people (Italians, Greeks, Portuguese). Careful blood and chemical studies indicated that these cases represented either an admixture of sickle cell haemoglobin and Mediterranean anaemia haemoglobin or of the presence of another abnormal haemoglobin. The entire chemical and inheritance pattern of these two probably related diseases was in a state of active study.

Two new disorders of the blood clotting factors were emphasized in 1952, one having to do with lysis of the clot (fibrinolysis), the other with a disease resembling haemophilia but arising from the deficiency of a plasma thromboplastin component (PTC). When a clot is formed, it is then gradually dissolved (lysed). This process is called fibrinolysis and is the

result of the activation of an inert proenzyme in the blood to the active fibrinolysin. H. J. Tagnon showed that certain cases of generalized cancer of the prostate gland, presenting themselves as a bleeding disorder, were the result of an excess of this fibrinolytic factor which destroyed other constituents of the coagulation system and resulted in severe haemorrhage. Recognition of this disorder was of great importance, not only because it helped to diagnose certain obscure bleeding disorders in men of the older age group, but because of the opportunities for treatment presented by the use of stilbestrol and castration. With regard to PTC deficiency, P. M. Aggeler and associates showed that a patient with a disorder superficially resembling haemophilia actually lacked a plasma constituent which was present in haemophilia. This could be corrected by appropriate amounts of thromboplastic extract. The differentiation of these rare bleeding disorders was of considerable importance from the standpoints of prognosis (outlook) and the development of definitive and special therapeutic methods for specific disorders. Bobsledding. Arthur Tyler of Rochester, N.Y., with Edward Seymour, a fellow townsman, as his

WEST GERMAN TEAM, led by Andreas Ostler, during the four-man bobsled event which they won at the winter Olympics in Norway, Feb. 22, 1952

brakesman, piloted his sled to the two-man title in the national Amateur Athletic union championships at Lake Placid, N.Y., Feb. 24, 1952. The winner's total elapsed time for the four heats over the Mt. Van Hoevenberg run was 5 min. 21.08 sec. Bill Dodge of New York city drove the second-place sled while Larry McKillip of Saranac Lake was third. Robert Duprey and three other riders from Saranac Lake raced to the four-man crown with a total time of 5 min. 00.78 sec. for four runs down the course. Riding behind Duprey for the Saranac Lake Bobsled club were Ralph Hartman, Gerry Morgan and Robert Swain, brakesman. The sled driven by Clarence Preston of Oneonta, N.Y., was second and Monroe Flagg's team from Saranac Lake was third.

Because of the lack of maintenance funds, the championship run was closed for the season late in February which cancelled out a number of feature events, including the junior national A.A.U. contests and the North American title meet. (See also OLYMPIC GAMES.) (T. V. H.)

Bolivia. Bolivia is a landlocked republic in south central South America. Area: 416,040 sq.mi.; pop. (1950 census of the Americas): 3,019,000; (1951 est) 3,054,000. The legal capital is Sucre (est. pop., 1946, 32,000); the actual seat of government is La Paz (est. pop., 301,000). Other major cities (with pop. est.) include Cochabamba (80,000), Oruro (50,000), Potosí (40,000), Santa Cruz (33,000) and Tarija (27,000). Racial distribution is estimated to be 52.34% Indian, 27.5% mestizo, 13.08% white, .22% Negro and 6.85% unspecified. Religion is predominantly Roman Catholic. Presidents in 1952: Gen. Hugo Ballivián, until April 11; Hernán Siles Suazo, April 11 to 16; thereafter, Víctor Paz Estenssoro.

History.—Throughout 1952, political instability continued to be a major Bolivian problem. President Ballivián promised in February that constitutional order would be achieved during the year, but his own government was overthrown two months later after a three-day revolt in which the fatalities were estimated at between 800 and 1,500. The rebellion brought to the presidency on April 16 Víctor Paz Estenssoro, leader of the outlawed Movimiento Nacionalista Revolucionario (M.N.R.), which had been in power in 1943-46, and had followed a pro-Axis policy in World War II. The M.N.R. is a party "of the masses, yet it is completely anti-Communist," the new president declared upon assuming office. "Our plans are not anticapitalist; we have never said we desire to nationalize the mines, but we are pledged to exploit the riches of the country for the benefit of the people." The Paz Estenssoro regime was recognized by the U.S. on June 2.

Stern measures were taken against domestic opponents of the new government. In April, armed bands prevented the further publication of the country's largest newspaper, *La Razón*, which had represented tin interests and which President Paz Estenssoro branded as an "enemy of the Bolivian people." During the same month, 16 opposition political leaders were arrested, and deposed President Ballivián went into exile in Chile. The Paz Estenssoro regime declared that it was prolabour in orientation, and a new Central Organization of Bolivian Workers was established to lend political support to the government. Evidence of strong labour dissidence was nevertheless recorded on April 22 when 870 miners and other workers struck at Corocoro in protest against the revolution. The regime announced on July 21 that congressional elections would be held in Jan. 1953. The entire nine-man supreme court was removed from office on Aug. 27, when it was replaced with pro-M.N.R. judges. The next day a new group of opposition leaders was imprisoned, charged with responsibility for a "terroristic plot designed to eliminate the chief government leaders."

BOLIVIAN REBELS firing from behind old walls on the outskirts of La Paz, during the revolt which unseated a military junta in April 1952

In an agreement signed on Sept. 29, the U.S. undertook to buy from 6,000 to 7,000 long tons of tin from the Bolivian government at a price of \$1.175 per pound, f.o.b. Peruvian and Chilean ports. Despite President Paz Estenssoro's initial declaration that the tin mines would not be nationalized, significant steps were taken in that direction in the months after his assumption of office. On May 14 a nine-man commission was named to study the feasibility of nationalization, and the Bolivian Mining corporation was established as a government agency on Oct. 3. Four days later, this corporation assumed control of the mine properties of the Patiño, Aramayo and Hochschild groups, the largest tin interests in the country. This step was taken for the declared purpose of preventing sabotage, and on Oct. 31, President Paz Estenssoro signed the decree taking over the three companies' properties. (G. I. B.)

Education.—Bolivia in 1950 had 1,500 rural schools with 110,000 pupils and 1,595 elementary schools with 147,060 pupils. There were 104 secondary schools (national and private) with 18,029 pupils. There were also several training colleges for teachers. There were universities with more than one faculty at Cochabamba, La Paz, Oruro, Potosí and Sucre. Education was scheduled to receive 16% of government expenditures in 1951. In 1951 there were 47 motion-picture theatres (not including those maintained by the tin mining companies) with estimated seating capacity of 32,300.

Finance.—The monetary unit is the boliviano, valued on June 30, 1952, at \$0.0165 U.S. currency, official rate; \$0.0099, legal free rate; \$0.0045, curb rate; and \$0.0077 and \$0.0053, special rates. The 1952 budget, as originally promulgated, provided for expenditure of 5,100,000,000 bolivianos (1951: 4,725,126,848 bolivianos) and revenue of 5,000,000,000 bolivianos (1951: 3,058,827,765 bolivianos). The public debt on Aug. 31, 1951, was 12,233,000,000 bolivianos, about half of which represented the foreign debt (including accrued interest). On Dec. 31, 1951, the debt of the national government to the Central bank was 3,019,978,888 bolivianos. Currency in circulation on April 30, 1952, totalled 3,994,000,000 bolivianos; gold reserves of the Central bank \$22,800,000; foreign exchange reserves \$11,200,000; dollar exchange in U.S. banks \$21,700,000; demand deposits 2,877,000,000 bolivianos. The cost of living index at La Paz stood at 203 in April 1952 (1948=100).

Trade and Communications.—Exports in 1951 were about \$150,900,000 (1950: \$94,000,000); imports were \$78,900,000 (1950: \$55,800,000). Leading customers in 1950 were the U.S. (52%) and the United Kingdom (41%); leading suppliers, the U.S. (39%), Peru (12%) and the United Kingdom (6%). Leading exports were tin (64%), lead (9%) and silver (5%).

Railway lines in operation (1946) totalled 1,546 mi. Several lines were in various stages of construction in 1952, including two from Argentina and Brazil, respectively, to Santa Cruz in the eastern lowlands. The highway system (1949) comprised an estimated 15,420 mi., of which 4,008 mi. were improved. Motor vehicles in 1950 included 3,727 automobiles, 8,391 trucks and 467 buses. There were about 75,000 radio receiving sets in 1950.

Agriculture.—Important crops, with estimated production in 1950–51 in metric tons, included wheat 16,000; barley 37,000; maize 110,000; rice 15,500; and potatoes 270,000. In 1948 there were an estimated 3,499,000 cattle, 4,195,000 sheep, 1,910,000 goats and 1,465,000 pigs. The principal exploited forest products were rubber and cinchona bark.

Manufactures.—In 1948 there were 2,305 factories with 25,000 employees. The most important, in terms of value of production, were electricity, textiles and clothing, beverages, foodstuffs and glassware and ceramics.

Mineral Production.—Exports in 1951 were reported as follows: tin 33,153 long tons; zinc 33,659 short tons; lead 33,105 short tons; antimony 13,025 short tons; copper 5,342 short tons; silver 7,156,590 fine ounces; mercury 700 short tons. Production of crude petroleum dropped to 523,412 bbl.; crude runs to stills were 422,567 bbl. (J. W. Mw.)

Book-Collecting and Book Sales. The great libraries and universities throughout the world had been actively collecting book rarities as such for generations. Other, smaller institutions were finding it necessary, if they were to maintain required scholarly standards, to establish rare-book collections. So it was that during 1952 institutional rare-book collections were established, or existing collections enlarged. A complete collection of Edgar Allan Poe was presented by Clifton Waller Barrett to the University of Virginia, Charlottesville; Cornell university, Ithaca, N.Y., acquired as gifts for its newly established rare-book department the Charles J. Paterson collection of Rudyard Kipling and the Nicholas H. Noyes collection of Booth Tarkington. Cornell also received as a gift the collection of books and manuscripts relating to the lumber trade assembled by Henry W. Sage. The Michael Sadleir collection of Victorian British novelists was purchased by the University of California at Los Angeles; and the records of Henry Holt & Co., publishers since 1866, were presented to Princeton university, Princeton, N.J. The Holt collection consisted of more than 400,000 letters, manuscripts and other documents. The Pequot collection, a group of about 3,000 choice rare books and manuscripts, relating in the main to America, including a copy of a "Columbus Letter" in Latin (Rome, Stephen Plannck, 1493), was deposited on loan in Yale university libraries. The collection, the property of a small group of Connecticut collectors, had been formed over a period of years. On a graver note, the Henry E. Huntington Library and Art gallery, San Marino, Calif., deemed it wise to construct, at a cost of \$250,000, an underground bomb-proof shelter for its \$50,000,000 collection of rare books, manuscripts and works of art. The Library of Congress received as a gift from Lessing J. Rosenwald the so-called "Giant Bible of Mainz," a manuscript Bible in two volumes. Presentation was made on April 4, 1952; the manuscript was begun on April 4, 1452.

In general, prices for books followed the pattern of several previous years, with genuine rarities bringing reasonably high prices. Following the inflationary trend, good material in 1952 brought higher prices than in 1951. The once popular 18th century British authors were in slow demand and comparatively few were offered. Desirable books of the 19th century, both British and American, found ready buyers. The largest sale of 1952 was that of the A. S. W. Rosenbach collection of Shakespeare (73 printed books) for an undisclosed price to Martin Bodmer of Geneva, Switz. Unofficially the price was stated at more than \$1,000,000, but that figure was doubted by informed bookmen. The Bodmer collection, one of the world's greatest, was described in *Eine Bibliothek der Weltliteratur* (1947). Press

books showed a definite decline in price and demand. Buying as a hedge against inflation caused some books to bring prices somewhat higher than presale estimates.

The most important sale of the year was held at Parke-Bernet galleries (New York, N.Y.) on Feb. 19–20, when a total of \$273,632 was realized for the Abraham Lincoln collection assembled by Oliver R. Barrett of Chicago, Ill. The catalogue issued for the sale listed 842 lots comprising several thousand documents, letters, relics, manuscripts, photographs and printed materials. Prior to the sale the collection had been offered en bloc to the Illinois State Historical library for \$220,000. Unable to raise the required amount, friends of the library nevertheless were the most active buyers at the auction.

The third and final volume of Donald Wing's *Short-Title Catalogue of Books . . . 1641–1700* was issued; volumes 1 and 2 were issued in 1945 and 1948. Plans were made to microfilm all books listed in *A Short-Title Catalogue of Books . . . 1475–1640. Book Handbook* (London) changed its name to *The Book Collector*, a more appropriate title for this superb periodical.

Throughout the world the 500th anniversary of the completion of the printing of the Gutenberg Bible was observed with continuing uncertainty as to precisely when that event happened; the consensus of informed people set the time as between 1452 and 1456.

The International League of Antiquarian Booksellers held its regular annual meeting in Geneva, Switz., July 21–26. Dealers from all over the world attended to discuss problems facing the antiquarian bookseller. (J. Bk.)

Book Publishing. During the first nine months of 1952, the number of new books and new editions published in the United States continued to rise to a total of 8,566 compared with 8,020 for the same period in 1951. (The total number of new books and new editions issued for the full year of 1951 was 11,255.) All indications pointed to an all-time high in book production for 1952, topping the record of 11,328 titles published in 1940. Fiction, after a jump from 1,216 titles in the first nine months of 1949 to 1,587 in the same period of 1951, continued about the same, 1,570 in those months of 1952, while juvenile titles (the next largest category) rose steadily from 587 in 1949 to 744 in 1951 and 810 in 1952 for a similar period. The total of technical books went up sharply from the previous year, 359 compared with 297 for the nine-month period, but books of science remained about the same, 495 in 1952 and 503 in 1951. From January through September, the only category to show a noticeable decrease was books on music, 58 in 1952 compared with 74 in 1951, while biography, geography and home economics as well as juveniles showed steady increases.

Best Sellers.—As of Sept. 1952, the best-seller list for fiction was headed by *The Silver Chalice*, by Thomas B. Costain, whose earlier historical novels had appeared on best-seller lists in previous years. Published in July 1952, it was on the list only 3 months compared with the runner-up, *The Caine Mutiny*, by Herman Wouk, 18 months on the best-seller lists and No. 1 book for 1951. Ernest Hemingway's *The Old Man and the Sea*, published on Sept. 8, promptly appeared on the list in third position while John Steinbeck's *East of Eden*, published on Sept. 19, was fifth on the list. *The Houses in Between* by Howard Spring was fourth and the sixth to tenth titles on the fiction list, as of September, were in that order: *The Gown of Glory* by Agnes Sligh Turnbull, *Don Camillo and His Flock* by Giovanni Guareschi, *Matador* by Barnaby Conrad, *My Cousin Rachel* by Daphne du Maurier and *The Distant Shore* by Jan de Hartog.

On the list of nonfiction best sellers for the first nine months of 1952, *A Man Called Peter* by Catherine Marshall topped

the list. This was an inspirational book written by the widow of a popular minister who died at the height of his career. Rachel Carson's *The Sea Around Us*, which was eighth on the 1951 list, was in second position in Sept. 1952. These were followed by *Windows for the Crown Prince* by Elizabeth Gray Vining, *Witness* by Whittaker Chambers, *Postmarked Moscow* by Lydia Kirk, *The Great Enterprise* by H. A. Overstreet, *The Diary of a Young Girl* by Anne Frank, *I Go Pogo* by Walt Kelly, *Memoirs: the Great Depression* by Herbert Clark Hoover and *Submarine!* by Commander Edward L. Beach.

These records were compiled on a percentage basis from the reports of 56 booksellers in various parts of the United States. The preponderance of bookstore sales in the last three months of a year often affect best-seller statistics considerably, and it was therefore possible that the final top ten titles for the entire year on both the fiction and nonfiction lists might well show a wide variation from September statistics.

Gross sales of trade books for the first half of 1952 were higher than for the first half of 1951 in an overwhelming number of bookshops, according to booksellers' replies to a questionnaire sent out by *Publishers' Weekly*, the trade journal of the industry. About three-fourths of the outlets reported increases in total trade book business with 9%–10% being the most common rate of increase. (A. J. R.R.)

Great Britain.—Both in respect to turnover and number of titles published, 1952 was a record year for book publishing in Great Britain. Trade turnover was the highest ever, exceeding £42,000,000. Comparison of this with the pre-World War II average of £10,000,000 indicates the modern development of book publishing. Exports of British books increased both in value (more than £14,000,000) and as a percentage of total turnover (more than 33%).

Early in 1952 book publishers experienced great difficulty in obtaining adequate supplies of paper and other materials, and the prices of paper, boards, cloth, etc., rose steeply. Later supplies became freer and prices fell. Unfortunately, the resulting reduction in production costs was more than balanced by increased printing and binding costs. On the whole, therefore, prices rose, the average published price in the period July to December 1951 being 13s. 2d. whereas that in the period January to June 1952 was 13s. 8d. In this connection the chairman of a well-known publishing house pointed out that his firm made less profit on a 14s. novel in 1952 than it did on a 10s. 6d. novel in 1951.

The rise in prices, together with the generally unfavourable economic situation in the early part of 1952, led to a fall in demand for fiction and general literature, though demand improved later in the year. In these circumstances publishers endeavoured to produce more reprints at comparatively low prices.

In the field of copyright the United Nations Educational, Scientific and Cultural Organization Universal Copyright convention was signed by 43 countries, including the United States. Should the United States ratify this convention an important step forward in the protection of British books in the U.S. would be achieved.

Other legislation of value to authors and publishers reaching the statute book in 1952 was the Defamation Amendment act which, it was hoped, would lessen the dangers arising from alleged libel and from unintentional libel. Authors were less successful when seeking tax concessions under the Income Tax act, 1952, though a modest concession was granted under section 24 in respect of lump sum payments for copyrights. Sir Compton Mackenzie, however, lost his appeal against the decision of the tax commissioners that outright sales of copyright were subject to tax.

A discouraging factor was the lack of prosperity among the

smaller publishing firms despite the publishing distinction that some of these firms showed. A more hopeful development was a realization by the established publishing houses that their markets were capable of considerable expansion if new methods were developed.

Boston. Boston, the capital of Massachusetts and the tenth largest city in the United States, with a land area of 46.1 sq.mi., had a population of 801,444 by the 1950 federal census, an increase of 30,628 or 4% over 1940.

Boston is located in Suffolk county, and under a legislative act passed in 1831 pays all the expenses of this county.

Projects of special import initiated during the year 1952 included expansion in off-street parking facilities reflected in the construction of the second in a series of downtown garages and development of the first in a proposed chain of parking areas in outlying sections of the city; extensive construction and reconstruction of important traffic arteries, including the first sections of the overhead highway which was to run through the centre of the city; establishment of a comprehensive classification and compensation plan affecting 12,000 municipal employees; further mechanization of election procedures through the purchase of 700 additional voting machines; and development of plans for a fair and equitable reassessment of all real property in the city.

MERRY-GO-ROUND in the "Jimmy Fund" clinic, part of the Children's Cancer Research foundation, which opened in Boston in 1952. The new clinic, devoted to the research and treatment of cancer in children, was partially financed by the Variety Club of New England and the Boston Braves baseball team

The tax rate for 1952 was \$66.80, an increase of \$4 over the previous year. Taxes levied on real and personal property (valued by assessors at \$1,573,516,000) reached a total of \$105,170,868.80, or \$6,467,140.80 more than in 1951. Larger maintenance requirements of city, county and school departments resulting, in the main, from general salary increases to municipal employees, together with a substantial increase in the amount of the Metropolitan Transit system deficit assessed on the city, accounted for the higher taxes.

The net funded debt of the city at the end of the year approximated \$68,600,000, representing a reduction of \$2,750,000 from 1951 as well as a total reduction of \$6,750,000 over a three-year period. (C. J. Fx.)

Botany. Of considerable importance in recent years had been the increasing number of studies on the cytology of the lower plants. During 1952 Edward de Lamater produced several studies of interest in this connection. Using a freezing-dehydration technique he found a typical mitotic process in the bacterial genera, *Bacillus*, *Escherichia* and *Micrococcus*, including morphologically distinct centrioles, chromosomes and the formation of a cell plate. The validity of De Lamater's claims of mitotic spindles and fusion tubes in bacteria was attacked by K. A. Bisset. Charles M. Wilson produced for the first time a clear study of nuclear behaviour in the water mould *Allomyces*. Meiosis was shown to follow the general pattern for most organisms and detailed life cycles were given. One subgenus was predominantly diploid with meiosis occurring in the germinating resistant sporangia. In another subgenus the nuclear divisions in the resistant sporangia were mitotic and consequently there was no sexual phase. Polyploidy was also reported.

The question as to whether a plant virus multiplies in its vector was settled for the aster-yellow virus by Karl Maramorosch. The earlier discovery of L. M. Black that this virus could be transmitted by needle inoculations to its insect host made possible this detailed study. Maramorosch carried the virus through the insect vector for ten serial passages, and direct evidence was found for the multiplication of the virus. It was concluded that the aster-yellow virus can therefore be considered both a plant and insect virus.

In a critical survey of the literature dealing with the Gnetales, A. J. Eames concluded that there is strong morphological evidence for distinguishing three orders, Ephedrales, Welwitschiales and Gnetales, and that the Ephedrales stand far apart from the other orders. The Ephedrales show many resemblances to the fossil group cordaites and apparently come from an ancient cordaite-conifer stock. Daniel Axelrod presented a theory of angiosperm evolution in an attempt to explain the history of the flowering plants from their earliest beginnings, basing his conclusions on paleobotanical evidence. The angiosperms were probably in existence in the Permian or Triassic, inhabiting upland regions in the tropical zone, and were undergoing rapid evolution. During late Triassic and Jurassic some extinction must have occurred which created discontinuities. Both monocotyledons and dicotyledons of present-day primitive types appear to have been present at this time. In early Cretaceous the angiosperms spread to lowlands and gradually began to replace the older gymnospermous floras. By the dawn of the Cenozoic many essentially modern species had evolved, and during this era the angiosperms continued to spread with major migrations and evolution as the result of aridity and glaciation.

The latest claims of the Russian geneticist, T. D. Lysenko, were reviewed by P. Maheshwari. Lysenko claimed to have found seeds of wheat and other cereals which when planted gave rise to different species or genera of cereals. The conversion

was attributed to the environment. Maheshwari adopted a sceptical view of these claims but pointed out that through androgenesis (the development of the male gamete inside the seed of a foreign species) and subsequent chromosome doubling, such an apparent conversion might occur. However, no cytological evidence was offered by Lysenko which might clarify the nature of the converted plants.

In a report on the cytogenetics of introgression, Roy E. Clausen used the example of the transfer of the gene for necrotic mosaic resistance from the wild tobacco, *Nicotiana glutinosa* (2n) to *N. tabacum* (4n). A triploid hybrid is produced and through selection a plant with 24 pairs and one univalent carrying the desired gene is obtained. The gene is then incorporated into *N. tabacum* through occasional association of the univalent with a tabacum chromosome.

In a genetic study of peas H. N. Barber and D. M. Paton secured results which suggest that flowering is not brought about by the production of a new flowering hormone but results from the sudden drop of a flower inhibitor substance.

Victor M. Cutter, Jr., et al. published a method of isolating living nucleuses from the endosperm of the coconut. It had previously been difficult to obtain large volumes of plant nucleuses because of the nature of the plant wall. This technique made possible studies of nuclear structure and culture, as well as enzymatic and respiratory investigations.

Among the other interesting developments were the following: Maize pollen grains which were found in a dried lake bed below Mexico City had been dated as 25,000 years old. The Connecticut Agriculture and Experiment station announced a new drug which in preliminary tests inhibited the growth of the fungus causing Dutch elm disease. The United States department of agriculture announced that they had succeeded in obtaining from guayule a rubber of a quality as high as that from *Hevea*. In tests to determine the effects of insecticides on trees, the U.S.D.A. reported that, instead of harming the trees and the surrounding soil, the insecticides actually exercise a beneficial effect. University of California scientists reported that green algae can utilize sewage to produce a food rich in protein. (See also GENETICS; PALAEOLOGY.)

Arboretums and Botanical Gardens.—Henry T. Skinner, formerly curator of the Morris arboretum of the University of Pennsylvania in Philadelphia, was appointed director of the National arboretum in Washington, D.C., during 1952. H. T. Skinner had spent many years in arboretum work, at Kew gardens in England, the Arnold arboretum in Boston, Mass., Cornell university and at the Morris arboretum in Philadelphia. Katherine K. Muller was appointed director of the Santa Barbara Botanic garden in Santa Barbara, Calif.

A western chapter of the American Association of Arboretums and Botanical Gardens was formed, with all members of the parent organization living in the Pacific states and British Columbia automatically becoming members.

The Langstroth Bee garden was dedicated at the Morris arboretum in Philadelphia, marking the 100th anniversary of Lorenzo Langstroth's discoveries which laid the foundation for modern beekeeping. There are a dozen swarms of bees in this garden, together with plants noted for nectar and pollen production. Various demonstrations were staged to show how bees aid in the national economy as pollenizers and honey producers.

Two arboretums showed tremendous strides in planting programs during the year, namely the Michigan State College ar-

boretum at East Lansing, Mich., and the Royal Botanic gardens of Hamilton, Ont., Can. In both, hundreds of new specimens were planted, showing a marked popular interest in ornamental plants in these two areas. (See also HORTICULTURE.) (D. Wn.)

In England, at the Royal Botanic gardens, Kew, the new Australian house, begun in the autumn of 1950, was opened on March 15, 1952. Accounts of three families, namely the Ranunculaceae, Oleaceae and Marantaceae, constituting the first three instalments of the *New Flora of Tropical East Africa*, were published, with the preface.

The most urgent research problem of the scientific staff of the Royal Horticultural society's gardens at Wisley was to find the cause and method of control of the bud blast mosaic of rhododendrons, especially in the home counties where it was causing serious damage. Work continued on the raising of antirrhinums resistant to the antirrhinum rust disease (*Puccinia antirrhini*). Several rust-resisting strains with different flower colours were released to the public.

At Cambridge the size of the botanical gardens was doubled so that it covered 40 ac. The planting of the new area was begun in the autumn. Some of the main features would be a long south-facing wall for growing tender plants; a number of beds for demonstrating experimental taxonomy, including a series of hybrids, polyploids, ectotypes, etc.; and an area devoted to different types of ecological habitats for plants growing in their natural surroundings. There was also a plan for a succession of small gardens illustrating the development of garden-making from Roman times to the present day, but this had not yet been decided upon.

(F. J. L.)

Bowles, Chester (1901—), U.S. ambassador to India, was born on April 5 in Springfield, Mass. He attended Choate school and Yale university, graduating in 1924, worked for a year on the *Springfield Republican* and four years in a New York advertising firm. In June 1929, in partnership with William Benton (*q.v.*), he started the advertising firm of Benton and Bowles, Inc., and in 1936 he became chairman of its board of directors.

In June 1942 he was appointed district director of the Office of Price Administration for the state of Connecticut. In the following year Pres. Franklin D. Roosevelt named him national OPA administrator. In early 1946 Pres. Harry S. Truman made him director of economic stabilization with responsibility for all anti-inflation wage, price and production controls.

In Nov. 1946 Bowles was appointed a U.S. delegate to the first conference of U.N.E.S.C.O. in Paris and in the early spring of 1947 he became international chairman of the United Nations Appeal for Children.

In Nov. 1948 Bowles was elected governor of Connecticut. During the two years of his administration he introduced legislation providing for expansion of public education, housing, welfare and child care programs, labour legislation and reorganization of the state government. He was defeated for reelection in 1950 by a narrow margin.

President Truman appointed Bowles U.S. ambassador to India and Nepal in Sept. 1951. The following January, Bowles was instrumental in negotiating a \$50,000,000 grant from the U.S. to India under the Technical Cooperation program to be used in raising the level of Indian agriculture and food production.

He was the author of *Tomorrow Without Fear* and many articles in national publications on economic, domestic and foreign affairs.

(R. R. R. B.)

Bowling. The 1952 tournament of the American Bowling congress, which had a record run of 85 days at Milwaukee, Wis., proved the most successful in the sport's history. A

new mark was set when 7,735 teams, numbering about 40,000 individual keggers, saw action and a new standard was set at the gate when 147,504 spectators paid to see the competition. Steve Nagy of Cleveland, O., voted the "Bowler of the Year," was the outstanding man of the tourney, pairing with John Klares of Cleveland to win the doubles title with 1,453, a new record, and annexing the all-events crown with 2,065, only six pins short of the mark for that test. Al Sharkey, Chicago, Ill., fired 758 to gain the singles laurels and the E. & B. Beer team of Detroit, Mich., took the five-man prize with a total of 3,115.

Willard Taylor, South Charleston, W.Va., won the master's invitation tourney with twin victories over Andy Varipapa, Hempstead, N.Y., 834-792 and 756-702.

The Women's International Bowling congress held its annual championships at St. Louis, Mo., with Lorene Craig, Kansas City, Mo., toppling 672 pins to capture the singles. Virginia Turner, Gardena, Calif., totalled 1,854 for the all-events trophy and Lorraine Quam and Martha Hoffman, Madison, Wis., combined for 1,206 to win the doubles. The Cole Furniture five, Cleveland, led for team honours with 2,854.

Mrs. Marion Ladewig, Grand Rapids, Mich., the women's national match game title winner, was chosen the "Woman Bowler of the Year" for the third successive season.

Frank Hanley, Shelton, Conn., carried away two titles from the National Duck Pin Bowling congress tournament at New Haven, Conn., rolling a 452 in the singles and a total of 1,239 for the all-events award. Mike Avon and Paul Jarman, Washington, D.C., established a new world record of 929 in annexing the doubles championship, while the Washington club of Providence, R.I., took five-man laurels with 1,933. Elizabeth Lowry, Richmond, Va., rolled 430 to lead the women in singles, while Anne Wissman, Stamford, Conn., won the all-events with 1,186. Ruby Hovanic and Rose Martinelli, Bridgeport, Conn., took the doubles with 764 and the Newfield Girls of Bridgeport scored 1,727 to triumph in the team race. Helen Ploss and Jack White, New Haven, Conn., pair, were victors in the mixed doubles.

Bowls: see LAWN BOWLING.

Boxing. Diminishing box-office returns at professional boxing matches during 1952 caused television to be viewed increasingly as a principal source of income for the sport. The development of theatre television was believed by many to have advanced the day when box-office receipts should become inconsequential.

At the same time, television posed a problem. Its operation was contributing to the depletion of the ranks of boxers under development. Small clubs, the incubators of boxing down through the years, found it impossible to operate without a television sponsor and the big networks sought only the prominent boxers. Since the International Boxing club of New York enjoyed prior contract privileges on every ring champion with the exception of the bantamweight and flyweight, the I.B.C. had the television field practically to itself.

In theatre television several important bouts were beamed to theatres at which admissions were charged, and at which boxing was the specific attraction. There was a distinct trend, particularly so since under such circumstances the spectacle was blacked out for home television consumption.

One of the bouts affected by the blackout was the match in which Rocky Marciano, Brockton, Mass., knocked out Jersey Joe Walcott, Camden, N.J., in 13 rounds, to gain the world heavyweight title. This bout was held in Philadelphia, Pa., Sept. 23. It provided the year's most dramatic battle. Marciano, unbeaten in 43 bouts, boasting 38 knockouts in a meteoric career,

became the first unbeaten heavyweight ever to win the title as well as the first white boxer to gain the title since Joe Louis dethroned James J. Braddock in 1937 at Chicago, Ill. The match attracted 40,379 persons and box office receipts of \$504,645, the year's biggest gate. An I.B.C. spokesman estimated an additional sum of \$550,000 from motion pictures, and the radio-television income was said to be \$125,000.

The largest crowd of the year was attracted to a light-heavyweight championship between Joey Maxim, Cleveland, O., defending champion, and Ray Robinson, New York, holder of the world middleweight title. This bout took place at the Yankee stadium, New York city, June 25, in a heat wave that registered 104° at the ringside, and ended with Maxim credited with a knockout victory when Robinson, victim of heat prostration, could not respond to the bell starting the 14th round. A crowd of 47,983 was reported, with receipts of \$421,615. The result was a surprise since at the time the bout ended Robinson had victory well in hand. Robinson shared another of the year's large gate receipts attractions when he knocked out Rocky Graziano, Brooklyn, N.Y., a former champion, to retain his world middleweight title. This bout was fought in Chicago on April 16, before 22,264 persons who paid receipts of \$252,237. Robinson had previously defended his title against Carl (Bobo) Olson, Hawaii, at San Francisco, Calif., March 13. In December the New York State Athletic commission declared Robinson's middleweight title "vacated" because of his failure to defend the championship once every six months as required by commission rules.

A total of 15 championship matches were held up to December. Five changes were recorded. Walcott had defended his heavyweight title against the former champion, Ezzard Charles, Cincinnati, O., in a 15-round bout at Philadelphia, June 5, before signing for the Marciano bout.

Jimmy Carter, New York, lost his world lightweight title to Lauro Salas, Mexico, at Los Angeles, Calif., May 14, but regained it Oct. 15 in Chicago, when he conquered Salas. Carter had triumphed over Salas in a title defense at Los Angeles on April 1. The Chicago bout attracted but 5,283 onlookers, smallest crowd in modern ring history for a championship. Vic Fowee, South Africa, defended his bantamweight title against Peter Keenan, Scotland, Jan. 25, but lost it to Jimmy Caruthers, Australia, on Nov. 15 on a knockout in 2 min. 19 sec. of the first round. Both fights were waged at Johannesburg, U. of S.Af. The first boxing championship was brought to Japan by Yoshiro Shirai, May 19, when he defeated Dado Marino, Hawaii, at Tokyo, Jap., for the world flyweight title. In a return bout Nov. 15 at Tokyo, Shirai retained the championship.

Among the most active champions was Kid Gavilan, Cuba, welterweight titleholder. He defended his crown three times, beating Bobby Dykes at Miami, Feb. 4, in the first white-Negro ring attraction in Florida; Gil Turner, Philadelphia, at Philadelphia, July 7; and Billy Graham, New York, at Havana, Cuba, Oct. 5. Only in the featherweight class was championship activity missing. Sandy Saddler, New York, the champion, was in the army.

Amateur boxing continued on a modified scale. The Amateur Athletic union's national championship tournament, a three-day affair ending April 9 at Boston, Mass., attracted only 138 entries. New York boxers won the team championship, leading 19 rival squads from continental America and Hawaii. The outstanding boxer was Floyd Patterson, 18-year-old New York high school student, who won the middleweight championship, scoring three knockouts in four matches. A squad of Chicago amateurs conquered a New York team, 9 bouts to 7, at Madison Square Garden, New York city, March 24, before 11,384, the

ROCKY MARCIANO (right) jubilant after the count which made him world heavyweight boxing champion on Sept. 23, 1952. He defeated Jersey Joe Walcott by a knockout in the 13th round of their title match at Philadelphia, Pa.

first time in four years the fixture failed to end in a deadlock.

Syracuse university (N.Y.) won its fourth straight team title in the Intercollegiate Boxing association championships at State College, Pa., March 8, leading the U.S. Military academy, Penn State, Virginia and Catholic university, in that order. On April 5, at Madison, Wis., the University of Wisconsin boxing team won the National Collegiate Athletic association championship team honours.

(J. P. D.)

Great Britain.—There was disappointment during the year at the failure of Randy Turpin to secure either a third contest with Sugar Ray Robinson for the world middleweight title or a meeting with Joey Maxim, the world light-heavyweight champion. Because of a lack of suitable contenders, however, the British Boxing Board of Control temporarily waived the "one man-one title" regulation and allowed Turpin to hold both the British middleweight and light-heavyweight titles at the same time.

Johnny Williams, the Rugby heavyweight, won the British and Empire titles by outpointing Jack Gardner, who, despite his great physical assets, proved a disappointing champion. After losing his light-heavyweight title to Turpin, Don Cockell decided to box as a heavyweight in the future.

The British welterweight and lightweight titles both changed hands within 24 hr. Wally Thom, the welterweight champion, was decisively beaten by Cliff Curvis, the Welsh "southpaw," and then young Frank Johnson, Manchester, outpointed Tommy McGovan, the lightweight champion.

In one of the most interesting contests of the year Ray Famechon, France, the European featherweight champion, outboxed Roy Ankarah, Gold Coast, in 15 rounds at Nottingham.

There was little activity in the bantamweight division, but

in the flyweight class the champion, Terry Allen, London, was defeated on points by the veteran Teddy Gardner, West Hartlepool. Later, Gardner was decisively beaten when defending his Empire title against an almost unknown young Zulu boxer, Jake Tuli, and immediately announced his retirement.

The British Boxing Board of Control gave an uncompromising refusal to requests for the televising of championships until further experience of its effects had been obtained. Only for small promotions, which did not clash with other tournaments, was the ban removed. British amateur boxing continued at a low ebb. Great Britain failed to get one competitor into the finals of the Olympic games at Helsinki, Fin. (W. B. Dv.)

Boy Scouts: see SOCIETIES AND ASSOCIATIONS, U.S.

Bradley, Omar Nelson (1893—), U.S. army officer, was born on Feb. 12 in Clark, Mo., was graduated from the U.S. Military academy at West Point, N.Y., in 1915 and became a major of infantry in World War I. He was graduated from the Infantry school, Fort Benning, Ga., in 1925, the Command and General Staff school, Fort Leavenworth, Kan., in 1929 and the Army War college, Washington, D.C., in 1934. He taught at West Point until 1938, and then had duty on the army general staff in Washington, D.C. During World War II he commanded the 2nd corps in Africa and Sicily, and subsequently all U.S. ground troops for the invasion of Europe. As commander of the 12th army group he supervised more than 1,300,000 combat troops, the largest body of U.S. soldiers ever to serve under a single field commander. By the end of the war he was a full general. From Aug. 15, 1945, to Dec. 1, 1947, he was administrator of veterans' affairs. On Feb. 7, 1948, he succeeded General of the Army Dwight D. Eisenhower as army chief of staff, and on Aug. 16, 1949, became the first permanent chairman of the U.S. joint chiefs of staff. In this office (to which he was reappointed for a second two-year term in 1951) he opposed the far eastern military policies of General of the Army Douglas MacArthur. During the senate's MacArthur investigation of 1951, Bradley testified that those policies would involve the United States in "the wrong war, at the wrong place, at the wrong time and with the wrong enemy." As an alternative, he advocated a policy of attrition against the Communist forces in Korea. Bradley also was a warm defender of the administration's foreign policy in Europe, declaring in a speech at Pasadena, Calif., on March 20, 1952, that the Mutual Security plan was the "least expensive" yet proposed to contain communism.

Bradley's autobiography, *A Soldier's Story*, was published in 1951.

Brannan, Charles Franklin (1903—), U.S. secretary of agriculture, was born on Aug. 23 in Denver, Colo., and was graduated from the University of Denver law school in 1929. He practised law in Denver until 1935, when he became assistant regional attorney of the Resettlement administration, and later regional attorney in the solicitor's office of the U.S. department of agriculture. From Nov. 1941 to April 1944 he was regional director of the Farm Security administration for Colorado, Wyoming and Montana. He was named assistant secretary of agriculture in June 1944 and secretary of agriculture in June 1948.

Secretary Brannan was the author of a plan designed to maintain farm incomes and still give the consumer the benefit of prices that would "seek their level," by supporting farm incomes with government subsidies to make up any difference between current market prices and farm incomes scaled to the 1939-48 level. Considerable controversy developed over the

plan, which had the support of Pres. Harry S. Truman, but agitation for it died down when the U.S. rearmament program sent farm prices upward again after the outbreak of the Korean war in 1950. The Republican party platform of 1952 denounced the Brannan plan as a scheme to "socialize agriculture."

Brazil. A federal republic in eastern and central South America, Brazil is the second largest nation in the western hemisphere. Language: Portuguese. Religion: predominantly Roman Catholic (39,177,880 according to the 1950 census) with about 1,500,000 Protestants of various denominations and 500,000 Spiritualists. Chief cities: Rio de Janeiro, the capital (1951 est. pop., 2,500,000); São Paulo (2,300,000); Recife (550,000); Salvador (450,000); Pôrto Alegre (425,000); Belo Horizonte (370,000); Fortaleza (290,000); Belém (270,000). President (from Jan. 31, 1951): Getúlio Vargas.

Brazil's area of 3,286,170 sq.mi. is second only to that of Canada in the western hemisphere. The population was 52,645,479 (1950 census); 53,377,000 (1951 est.), concentrated mostly along a narrow coastal strip. Highest percentages: the Federal District and the states of Rio de Janeiro, Alagoas, São Paulo, Pernambuco, Sergipe and Paraíba.

Area and Population of States and Territories of Brazil

(Estimates published by the Instituto Brasileiro de Geografia e Estatística)

State or territory	Area (sq. mi.)	Pop. (Jan. 1, 1950)	Capital

*Area in dispute between the states of Minas Gerais and Espírito Santo.

History.—During the year 1952 the nation was confronted with a number of serious problems, including ever-increasing inflation; the Communist infiltration in government and the armed forces; the gradual breaking up of political co-operation between the major political parties on questions of basic national interest; corruption and speculation in governmental and semi-governmental institutions; and a mounting indebtedness in foreign countries.

Among other measures to control inflation, the administration called upon private banks to enter into a voluntary agreement to restrict loans for speculative purposes; appealed to state governments to avoid any increase in taxes and to maintain balanced budgets; ordered an investigation into the collection of taxes payable by industrial corporations (it was officially announced that in the Federal District and São Paulo alone the revenue authorities had discovered that certain real estate companies had failed to pay an estimated total of U.S. \$45,000,000 in taxes during the previous year); asked state authorities to avoid any increase in salaries of government employees; and tightened

foreign import licence controls.

Despite these and other measures, the administration failed to stop the rising of prices. It was said that Brazil had one of the highest cost of living levels in the world. This situation, aggravated by the insufficiency of essential foodstuffs in the large metropolitan areas—caused not so much by lack of those commodities as by inadequacy of means of transportation—resulted in considerable unrest, particularly among the poorer classes. These conditions were exploited by Communist agitators and opponents of the administration and led to scattered strikes, some of which—such as that of the railroad workers in Divinópolis, state of Minas Gerais in early September—resulted in bloody conflicts between the strikers and the police forces.

Although denied consistently by the minister of war, Gen. Newton Estillac Leal, Communist infiltration in the army was the subject of strong and apparently well-documented attacks on the part of certain Rio de Janeiro newspapers, including *Correio da Manhã* and *Tribuna da Imprensa*. The question came to a head when Gen. Euclides Zenobio da Costa purged his command of several men and officers who had been convicted of belonging to the Communist party. Rebuked by the minister of war, General Zenobio da Costa asked to be relieved of his command.

At the same time, because of public clamour, the minister of war also presented his resignation to President Vargas. The president accepted both resignations, and appointed Gen. Ciro do Espírito Santo Cardoso to replace General Estillac Leal as minister of war. During subsequent months, more officers and men were tried and convicted of Communist activities.

The co-operation which President Vargas had received from the major parties in the first year of his administration seemed to come to an end during the year. The administration found itself unable to secure congressional approval for a number of its important proposed measures, including bills creating the Petrobrás national oil corporation (to exercise the monopoly over the exploitation of national oil resources); establishing a new coffee institute; and adopting new foreign exchange regulations.

In his address to the nation on Independence day (Sept. 7) President Vargas appealed once more to all parties to form a national union to help to solve the serious problems that confronted the nation. Although the appeal was received with general applause, no concrete evidence seemed to be forthcoming of real political harmony. General criticism of the administration continued with calls for a change in the presidential cabinet and amendment of the 1946 constitution. Criticism was particularly directed against the stringent measures taken by Minister of Finance Horacio Lafer to stop inflation, and against the scandals arising from misappropriation of funds in the Banco do Brasil and evidences of peculation in some of the semi-official labour institutes.

The country's financial difficulties were aggravated during the year by a decrease in the exports of national commodities which was reflected in an alarming increase of commercial indebtedness in foreign countries, the total of which was estimated at about U.S. \$500,000,000 at the end of the year. Although Brazil had accumulated a substantial balance of foreign exchange at the end of 1950, this balance was rapidly depleted by purchases abroad, and as time went on the country found itself owing to U.S. banks approximately U.S. \$250,000,000 and to other foreign nations a similar amount. Brazilian credit suffered as a consequence and the cruzeiro decreased in value in terms of foreign currencies.

It was said at the end of the year that the United States-Brazil joint committee for economic development (organized in July 1950) was about to end its activities, after recommending

a number of projects to the consideration of the two governments. Seven loans, totalling U.S. \$58,300,000, were being considered by the Export-Import Bank of Washington and the International Bank for Reconstruction and Development for approved projects in Brazil. Brazil had received from the Export-Import bank loans totalling U.S. \$61,400,000 for improvements of railroads, electric power development and the purchasing of agricultural machinery. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.)

U.S. Secretary of State Dean Acheson visited Brazil on a mission of good will in July. During his visit he declared that the United States government was anxious to help Brazil in every way possible.

(R. D'E.)

Education.—In 1950 there were 60,000 primary schools with 4,500,000 pupils, about 1,500 secondary schools with 300,000 students and about 2,700 vocational, commercial and professional schools with 200,000 students. There were 11 universities, of which 3 were private (Catholic), 7 state and 1 federal (University of Brazil at Rio de Janeiro). In 1951 the 1,736 motion-picture theatres had a seating capacity of 1,071,560.

Finance.—The monetary unit is the cruzeiro (Cr\$), valued at \$0.0534 U.S. currency, official rate during 1952, and at \$0.0287, curb rate, on Sept. 30, 1952. The 1952 budget as approved by congress called for expenditure of Cr\$ 25,431,000,000 and revenue of Cr\$ 25,537,000,000. The 1953 draft budget as presented to congress in May 1952 called for expenditure of Cr\$ 30,482,155,139 and revenue of Cr\$ 30,509,000,000. Actual government expenditure in 1951 was Cr\$ 24,300,000,000 and revenue, Cr\$ 27,100,000,000. On Dec. 31, 1950, the internal floating debt was reported at Cr\$ 14,849,110,182; internal funded debt Cr\$ 10,439,287,620; external debt £37,700,265 and \$110,268,695. Currency in circulation (May 31, 1952) amounted to Cr\$ 28,640,000,000; gold reserves (Aug. 31, 1952) \$317,000,000; foreign exchange reserves, Bank of Brazil (Aug. 31, 1952) \$179,000,000; dollar exchange in U.S. banks (Aug. 31, 1952) \$92,000,000. The cost of living index (São Paulo) stood at 124 in April 1952 (1948=100).

Trade.—Exports in 1951 totalled Cr\$ 32,514,000,000; imports, Cr\$ 37,198,000,000. In the first six months of 1952 exports were Cr\$ 12,900,000,000 and imports Cr\$ 22,450,000,000. Leading exports in 1951 were coffee (57%), raw cotton (12%), cacao (4%), pine (3%) and hides and skins (2%); leading imports, machinery and vehicles (42%), petroleum and products (12%), wheat and flour (10%), chemicals and drugs (7%) and iron and steel and manufactures (5%). The leading customers were the U.S. (49%), the United Kingdom (10%), France (5%), Germany (5%) and Argentina (4%); leading suppliers, the U.S. (42%), the United Kingdom (8%), Argentina (6%), Germany (6%) and the Netherlands Antilles (5%).

Communications.—Railway mileage (1951) was about 23,000; highways, 38,000; common roads, 124,000. On Jan. 1, 1951, there were 238,478 automobiles, 192,023 trucks and 14,220 buses. In 1950 the 21 Brazilian air lines flew 42,500,000 mi. and carried 1,616,420 passengers. According to *Lloyd's Register of Shipping*, the merchant marine had 335 vessels (100 tons and over) aggregating 687,788 gross tons on June 30, 1951. There were three television stations in operation in 1952.

Agriculture.—Coffee production in the 1950-51 season totalled 16,948,000 bags of 132 lb. each. In 1951, 16,358,000 bags were exported, of which 10,506,000 bags went to the U.S., 734,000 bags to France and 569,000 bags to Sweden. Cacao production in 1951-52 was 104,725 metric tons; 96,000 tons were exported in 1951. Cotton (ginned) production was estimated at 336,000 metric tons in 1951-52; exports totalled 143,412 tons in 1951. Preliminary estimates for other crops in 1951-52 included rice (paddy) 2,770,000 metric tons; wheat 495,100 tons; maize 6,342,000 tons; peanuts 147,900 tons; potatoes 726,700 tons; tobacco 116,800 tons. Refined sugar production in 1951 was 1,903,000 metric tons. In 1951, 167,189,000 stems of bananas were produced. Wheat imports totalled 1,305,525 tons in 1951.

Livestock (Dec. 31, 1948) included 50,089,000 cattle, 13,804,000 sheep and 23,881,000 pigs. About 5,900,000 head of beef cattle were slaughtered in 1950. Wool production was 20,550 short tons. Rubber production (1951) was 21,200 metric tons; carnauba wax exports, 9,579 tons. In 1951, 34,100 tons of Brazil nuts (unshelled) were exported.

Manufactures.—Production in 1951 included cement 1,398,000 metric tons; pig iron 760,000 tons; raw steel 828,000 tons; electric energy 8,700,000,000 kw.hr.; beer 7,425,000 hl. Production at the national steel plant at Volta Redonda included coke 286,000 tons; pig iron 342,000 tons; rolled-steel products 343,000 tons; steel ingots 465,000 tons.

Mineral Production.—Production in 1951 included coal 1,944,000 metric tons and gold 141,397 troy ounces; iron ore, manganese, tungsten, bauxite and diamonds were also produced. In 1951, 1,005,371 metric tons of coal were imported.

(J. W. Mw.)

Bread and Bakery Products. In every country regardless of its degree of industrialization bread always has been made by a batch process. During 1952 several reports in trade publications alerted bakers

in the United States to the fact that a new, continuous process of bread production had been developed, had survived the pilot plant stage and soon would be subjected to actual trial in the New York market. While details of the new baking process had not been made public late in the year, a continuous method of bread production, referred to as the "no-dough-time dough process," had been perfected on a laboratory scale and reported as early as 1940 by John C. Baker of Wallace and Tiernan Co., Inc., Belleville, N.J., the company which sponsored the more recent work.

Meanwhile, construction of what was designated by Peter Pirrie and Allen Somers as the largest automatic bread and cake bakery in the world was completed and baking operations were begun in 1952 by the American Stores company in Philadelphia, Pa. This bakery had an estimated bread production of 2,500,000 lb. weekly, and an undisclosed production capacity for cakes, sweet goods, doughnuts and pie.

E. Maes and his collaborators in Ghent, Belg., studied bread baking in the high-frequency electrical field and, as others had found, reported that a baking time of $1\frac{1}{2}$ to 2 min. sufficed to bake a loaf of bread. Such bread has no crust, and the flavour differs from that which develops when bread is baked by conventional methods.

Evidence that the baking of bread results in a partial cleavage of shortening, to form monoglycerides, had been adduced by N. H. Kuhrts and his collaborators. This observation was of interest in connection with the controversy over the use of monoglycerides and polyoxyethylene esters of fat-forming fatty acids as softeners in the production of commercial bread. The standards for bread which during the year were released by the U.S. federal security administrator permitted the limited use of monoglycerides as ingredients, but prohibited the use of polyoxyethylene monostearate and related compounds, because of insufficient evidence of their lack of toxicity and their value to consumers. Additional evidence to support the view that these softening agents do not retard the rate of staling was presented by S. S. Jackel and others. While some of the emulsifiers were not included by the U.S. Food and Drug administration in the list of permissible ingredients of bread, these chemicals continued to be widely used in commercial cake production. However, according to a report by Arthur T. Joyce, most of the cake consumed in the United States continued to be baked at home.

As a result of their investigations, the U.S. house of representatives select committee to investigate the use of chemicals in foods and cosmetics recognized in July 1952 the need for supplemental legislation to require the adequate pretesting of new ingredients of foods, including bakery products. A similar recommendation was embodied by trade associations of the baking industry of the United States in a statement of policies, in order that the public might be more adequately protected.

It had sometimes been recommended that bread in the home should be stored in the refrigerator. A release of the U.S. department of agriculture pointed out that the refrigeration of bread retards the development of mould, but at the same time it accelerates the staling of the bread. Recommendations were made to the industry for the delivery of fresher bread in the winter months in those communities where the weather is moderately cold. These recommendations included suggestions for the heating of the loading docks of wholesale bakeries, provision for warming and insulating delivery trucks and the elimination of the so-called drop boxes in which bread had been temporarily stored when delivered prior to the opening of the grocery stores where it was purchased by consumers.

Although statistics on the baking industry in the United States had not been released late in 1952, industry leaders agreed that the dollar volume remained at about \$4,000,000,000

annually, although the tonnage might be somewhat reduced. (See also FLOUR.)

Brewing and Beer. Beer and ale sales in the United States for the fiscal year ending June 30, 1952, totalled 84,293,729 bbl. (of 31 U.S. gallons each), the third highest fiscal year on record. The largest sales total for a fiscal year was 86,992,795 bbl. in 1948.

Among important 1952 developments was the easing of the can situation for brewers. During 1951 tightening of metals supplies resulted in the National Production authority issuance of an order limiting brewers' use of cans to 70% of their 1950 base period usage. With the supply situation easing, an NPA order, effective April 1, 1952, raised the beer can quota to 90% of the brewers' 1950 base period usage. Indications were that can limitation might be lifted entirely by 1953 in view of the improved situation on formerly critical materials.

Since packaged beer accounts for approximately 75% of the brewers' national output—an exact reversal of the ratio maintained prior to 1934—and about 25% of package beer is sold in cans, the easing of the container situation apparently had a favourable effect on the beer market. This was reflected in sales figures for the first seven months of 1952, which showed a 2.7% gain over the corresponding period of 1951 and the highest seven-month total ever recorded.

The trend toward greater home consumption, which started about 1935 with the introduction of improved packaging designs, including the can and the no-deposit bottle, was continued during 1952. Another contributing factor, according to market analysts, was the spread of television, popularizing entertainment at home. Various market surveys had shown that beer is an important commodity in home entertainment.

Another important development was the continued progress in the safety campaign spearheaded by the United States Brewers foundation's industry-wide safety contest. In 1951 ten breweries completed the first six months of the year without lost time through accidents or injuries. During the similar period in 1952 this record was achieved by 17 breweries. On an over-all basis, the brewing industry's safety record for the first seven months of 1952 improved 17.18% over the same period in 1951, which itself had established industry safety records.

The foundation's Armed Forces Liaison program, helping to maintain wholesome conditions surrounding the retail sale of beer at establishments frequented by military personnel, extended its scope during 1952. An innovation was the distribution of ID (identification card) posters to beer retailers. These posters reproduced the ID card carried by military personnel and alerted tavern owners to check the age of uniformed men where there was suspicion that they might be minors. The posters, according to many military authorities, proved an effective check against serving minors.

The military liaison program was an extension of the industry's self-regulation program, operated by the foundation and designed to impress upon industry members and the public the importance of strictly observing all laws and regulations and of maintaining high standards of operation in the public interest.

The weekly average pay for brewery production workers during the calendar year 1951 was \$78.99, compared with \$64.38 for all manufacturing. A new high was recorded in May 1952, when, according to the U.S. department of labour, brewery workers' weekly earnings averaged \$82.78.

Federal excise taxes, at \$8 per barrel until Nov. 1, 1951, and \$9 per barrel thereafter, and special taxes on malt beverages for the fiscal year 1952, totalled \$740,284,506—the highest recorded in a single year. This brought the cumulative total since relegalization of malt beverage sales (April 7, 1933) to \$8,912,447,603. State and local taxes and licence fees in fiscal 1952 were estimated at \$215,000,000, raising the cumulative figure for that revenue to about \$2,945,000,000. Combined public revenue since 1933 thus had reached approximately an aggregate of \$11,857,000,000. (See also LIQUORS, ALCOHOLIC.)

(E. V. LH.)

Bridge, Contract: see CONTRACT BRIDGE.

Bridges, (Henry) Styles (1898—), U.S. senator, was born at West Pembroke, Me., on Sept. 9. He graduated in 1918 from the University of Maine and, after teaching at Sanderson academy, Ashfield, Mass., he became a county agricultural agent and a specialist on crops and soils for the University of New Hampshire. In 1934 he was elected governor of New Hampshire for the term 1935–37. In 1936 he was elected Republican senator from New Hampshire for the term 1937–43 and was re-elected for the terms 1943–49 and 1949–55.

In the senate Bridges voted consistently with the Republicans against New Deal measures, excepting the Selective Service act and the various defense and war appropriations. A bitter critic of Secretary of State Dean Acheson and his foreign policy, Bridges was denounced by Pres. Harry S. Truman in 1950 as a Kremlin asset in the cold war. On Aug. 19, 1951, Bridges with seven other Republicans of the senate armed services and foreign relations committees, denounced President Truman's dismissal of Gen. Douglas MacArthur as proof that the administration's far eastern policy had been "the most desolate failure in the history of our foreign policy." Primarily an internationalist, however, Bridges disagreed with both former Pres. Herbert

Hoover and Sen. Robert A. Taft during the "great debate" on U.S. foreign policy in 1951.

Senator Bridges was appointed minority leader of the senate on Jan. 8, 1952, to succeed Kenneth S. Wherry of Nebraska, who died in 1951. During the steel strike crisis of 1952, Bridges vehemently opposed President Truman's seizure of the steel industry, urging that this action be made the subject of a full-fledged congressional investigation.

Bridges. The world's longest spans of the various types built up to 1953 are listed in the table. There was one change in the table during 1952. The longest continuous girder span increased from 643 ft. to 676 ft.

World's Longest Spans by Type of Bridge

Type	Bridge	Location	Year Completed	Span
Cable Suspension	Golden Gate	San Francisco	1937	4,200 ft.
Transporter Bridge	†Sky Ride	Chicago	1933	1,850
Cantilever	*Quebec	Canada	1917	1,800
Steel Arch	Kill van Kull	New York	1931	1,652
Eyebar Suspension	*Florianópolis	Brazil	1926	1,114
Concrete Arch	Sando	Sweden	1943	866
Continuous Truss	Dubuque	Mississippi river	1943	845
Simple Truss	*Metropolis	Ohio river	1917	720
Continuous Girder	Düsseldorf-Neuss	Rhine river	1951	676
Vertical Lift	*Cape Cod Canal	Massachusetts	1935	544
Wichert Truss	Homestead	Pittsburgh	1937	533½
Swing Span	*Fort Madison	Mississippi river	1927	525
Tubular Girder	*Britannia	Menai straits	1850	460
Timber Span	*McKenzie River	Coburg, Ore.	1926	380
Prestressed Concrete Girder	Heilbronn	Germany	1949	353
Bascule	*Sault Ste. Marie	Michigan	1914	336
Simple Girder	Harlem river	New York	1951	330
Masonry Arch	Plauen	Saxony	1903	295
Single Leaf Bascule	*16th Street	Chicago	1919	260
Concrete Girder	Villeneuve	Seine river	1939	256

*Railroad bridge.

†Not standing.

United States.—On Dec. 1, 1951, the Golden Gate suspension bridge at San Francisco, Calif., the longest bridge in the world, was subjected to a 72-m.p.h. wind that caused the bridge to vibrate vertically through a maximum range of 85 in. with some damage to the bridge structure.

The Mackinac Bridge authority applied to the Reconstruction Finance corporation for an \$85,000,000 loan to build a bridge connecting the upper and lower peninsulas of Michigan. The bridge was to have 26 spans, including a 3,800-ft. suspen-

CHESAPEAKE BAY BRIDGE, a cantilever truss bridge linking the Delmarva peninsula with the mainland of Maryland to enable north-south express traffic to by-pass Philadelphia and other cities. It was dedicated July 30, 1952

RAISING THE CENTRE SECTION of one of three bridges on the Autopista highway which was being carved through the foothills of the Andes mountains in Venezuela in 1952. The prestressed concrete bridges were being built by a French firm, using a patented concrete system instead of steel

sion span.

The Washington State Toll Bridge authority made plans in 1952 for a \$70,000,000 bridge over Puget sound at Seattle.

In 1952 the California Toll Bridge authority considered a second crossing over San Francisco bay between Richmond and San Rafael. The estimated cost was \$46,000,000.

A bridge authority was created in 1952 to proceed with preparations for building a \$45,000,000 bridge across the Mississippi river at New Orleans, La.

The Chesapeake Bay bridge, just north of Annapolis, Md., was completed in 1952. The length was 21,286 ft. and included a 1,600-ft. suspension span with an underclearance of 186½ ft. The cost was \$42,600,000.

Plans were completed in 1952 for a new crossing over the Hudson river at Kingston, N.Y. The total length of the bridge was to be 7,700 ft. and the estimated cost was \$20,000,000. The two channels of the river were to be bridged by duplicate units of 500-800-500-ft. continuous deck spans.

To provide a link in the conversion of an existing overcrowded highway into an express highway of ample capacity, plans were started in 1952 to parallel the Thomas A. Edison bridge over the Raritan river near Perth Amboy, N.J., with an additional bridge of similar appearance. The new bridge was to be 4,400 ft. long with 200-250-200-ft. continuous plate-girder spans for the main crossing. The new bridge was planned for building in two stages, as required by traffic, at a total estimated cost of \$14,000,000.

The George P. Coleman Memorial bridge over the York river at Yorktown, Va., was completed in 1952 at a cost of \$8,000,000. It had two 500-ft. swing spans in tandem to provide a clear channel of 450 ft.

To connect Philadelphia with the Pennsylvania turnpike, an \$80,000,000 17-mi. four-lane highway with three bridges across the Schuylkill river was planned in 1952.

Construction was started in 1952 on a 14-mi. stretch of highway and bridge across Tampa bay, Florida, from St. Petersburg to Manatee county. The estimated cost was \$20,000,000. A 100-ft. lift span and a high-level cantilever bridge would provide for navigation.

A \$16,000,000 double-deck, high-level bridge was proposed in 1952 for Seattle, Wash., to cross an arm of Lake Union, with six traffic lanes on the upper deck and two reversible-flow lanes on the lower deck.

A 15-mi. bridge was started in 1952 over lower Tampa bay in Florida. It was to have three miles of trestle with a factory-prestressed concrete deck. The two channels were to be crossed by a 90-ft. twin-leaf bascule and a 1,584-ft. cantilever bridge. The estimated cost was \$15,000,000.

Selection of a site for a second floating bridge across Lake Washington, east of Seattle, Wash., was made in 1952. The length of the bridge was to be 7,600 ft. and the estimated cost was \$12,400,000.

Norfolk and Portsmouth, Va., were connected by a bridge-tunnel project in 1952. The bridge crossed the east branch of the Elizabeth river; the tunnel went under the west branch of the river. The bridge was 2,135 ft. between abutments and included a double-leaf rolling-lift bascule. The cost of the bridge was \$7,415,000.

A bottleneck on the road between New York city and Long Beach was removed with the completion of a \$6,000,000 153-ft. double-leaf bascule in 1952. The total width was 78 ft. The new bridge was built adjacent to the old bridge which was then demolished.

In Jacksonville, Fla., two bridges were started over the St. Johns river. The Gilmore street bridge, 3,600 ft. long, estimated at \$5,300,000, was to include a double-leaf bascule span. The Arlington bridge was to be 7,375 ft. long and was estimated to cost \$11,300,000. It would include a cantilever with 406-810-406-ft. spans.

Dade county, Fla., built two skewed bascule bridges in 1952. This type of bridge was built only once before, in Brooklyn, N.Y., in 1944.

In Kentucky relocation of highways required by flooding of valleys for reservoirs required bridges with exceptionally high piers. In the Wolfe Creek reservoir a pier 203 ft. high was built

before the reservoir was filled.

A concrete viaduct of novel design, forming part of a traffic interchange for the George Washington bridge, was completed in 1952. It consisted of continuous hollow concrete box girders on a single row of long slender round columns. There were ten 66-ft. spans, all on a curve of 200-ft. radius.

In 1952 Chicago, Ill., planned to add three bridges to its long list—a twin bascule at Congress street and new bridges at Halsted street and at Van Buren street, all over the Chicago river.

Construction was started in 1952 on a bridge over Bay St. Louis in Mississippi. It required the precasting and floating into place of 182 deck sections weighing 119 tons each.

Near Port Townsend, Wash., a girder bridge with a 250-ft. main span was built in 1952 in an unusual combination of concrete and steel box girders. Two 55-ft. concrete box-girder cantilever arms carried a 140-ft. steel box-girder suspended span.

In King county, Wash., a pair of welded box girders, 111 ft. long, were the main members of a new bridge built in 1952.

At Duvall, Wash., an 1,182-ft. bridge was built in 1952 of continuous reinforced-concrete box girders of constant depth. The main crossing was continuous with 117-160-117-ft. spans, 7 ft. deep. The box form of construction gave the bridge a smooth exterior.

Canada.—A contract was awarded in 1952 to build a suspension bridge with a 1,447-ft. main span across Halifax harbour in Nova Scotia with a vertical clearance of 165 ft. at a cost of \$8,000,000. Completion was scheduled for 1954.

In 1952 Canadian army engineers commenced the construction of a 1,600-ft. \$2,500,000 bridge in the Donjek valley of the Yukon territory, less than 300 mi. from the Arctic circle, to replace wooden bridges that were washed out. The new bridge was to have eight steel and concrete spans.

Plans were prepared in 1952 for a new bridge to replace the Duplessis bridge over the St. Maurice river at Three Rivers, Que., which collapsed Jan. 31, 1951. As the failure was attributed solely to defective material, the new design was made similar to the original.

Brazil.—Construction was started in the state of Rio Grande do Sul in 1952 on an 856-ft. reinforced-concrete arch bridge with a main span of 610 ft. and a rise of 92 ft. at an estimated cost of \$750,000. This would be the third largest reinforced-concrete arch in the world.

Three other long-span prestressed-concrete bridges in Brazil were finished and three more started. The Galeao bridge had 15 spans of prestressed concrete, with the longest span 142 ft.

Cuba.—The Canimar river was bridged in 1951 by three 218-ft. reinforced-concrete arches. The total length of the bridge was 973 ft., with the deck 115 ft. above water and 53½ ft. wide. The bridge was completed in nine months.

England.—The longest prestressed-concrete bridge in England was a cantilever with a main span of 150 ft., built in 1951. A 60-ft. prestressed-concrete span was hung in the centre. The total length was 247 ft.

A new suspension bridge was planned in 1952 near Chepstow over the Severn river.

France.—A concrete box-girder cantilever bridge built in France in 1951 introduced a novel idea in bridge construction. The bridge rested on two struts on the main pier, inclined to pass their resultant through the centre of the pier base to minimize the size of the pier. The bridge crossed the Donzere-Mondragon canal in the Rhone river valley.

Germany.—A new record for span length of continuous-girder bridges was set in 1951 by the completion of the Düsseldorf-Neuss span over the Rhine. This bridge had a total length of 2,500 ft. with a record-breaking main span of 676 ft., flanked

by 338-ft. spans.

The girders were two continuous boxes 25 ft. wide, spaced 20 ft. apart. Cantilevered 14-ft. sidewalks brought the total width of bridge to 98 ft. All shop fabrication was by welding, made possible through use of a new high-strength weldable alloy steel. Rivets were used only in field splices. The webs were unusually thin and were stiffened in the manner of aircraft construction. Cantilever construction of the main span reduced dead load bending moments at the centre and permitted a girder depth of only 11 ft. at mid-span. At the piers, the girder depth was 25½ ft.

Portugal.—The largest bridge in Portugal was completed in 1952 across the Tagus river, above Lisbon. It had five 336-ft. tied-arch spans with plate girder stiffening below deck. The cost was \$3,500,000. (See also ROADS AND HIGHWAYS.) (D. B. S.)

British Borneo. British-administered territories in Borneo (including island of Labuan) and Sarawak, and the protected state of Brunei. *North Borneo*: area, 29,387 sq.mi.; pop. (1951 census) 334,141, including 74,374 Chinese; capital, Jesselton (pop. c. 5,000); governor in 1952, Sir Ralph Hone. *Sarawak*: area, 47,071 sq.mi.; pop. (1947 census), 546,385, including 145,158 Chinese; (1951 est.) 570,000; capital, Kuching (pop. c. 38,000); governor (and high commissioner for Brunei), Sir Anthony Abell. *Brunei*: area, 2,226 sq.mi.; pop. (1947 census) 40,657; (1951 est.) 48,000; capital, Brunei or Daru'l Salam (pop. 1947, 10,620); ruler, Sultan Omar Ali Saifuddin.

Language: various indigenous; Chinese; Malay (the lingua franca). Religion: Moslem (Shafi'i sect, etc.); various pagan; many Chinese Christians.

History.—In North Borneo 1952 began with a favourable trade balance of more than 40,000,000 Malayan dollars, but the subsequent fall in the price of rubber and other raw materials made it improbable that this record figure could be reached again at the end of 1952. Development, however, was being pressed forward with encouraging results and included prospecting for bauxite and oil. The outstanding political events of the year were the opening of the new combined supreme court for North Borneo, Sarawak and Brunei (previously there had been two separate judiciaries—one for North Borneo, another for Sarawak and Brunei); and the inauguration of a more modern system of local government by the setting up of a (nominated) local government authority in Kota Belud. In Sarawak on June 25 a new oil mining lease was negotiated between the government and Sarawak Oilfields Ltd. under which the area held under lease would, within 15 years, be reduced to 25% of the colony (the old lease covered all of it); the minimum royalty, based on a percentage of production, was revised to £10,000 a year, and the company became for the first time liable to income tax. Communist trouble broke out near Kuching on Aug. 7 with robbery and murder by a small gang of armed Chinese which probably came from and certainly escaped over, the Indonesian border. The governor declared a state of emergency and several known Communists were arrested. The non-Chinese communities immediately offered to help but the prompt measures taken were effective. (K. G. B.)

Education.—(1951) North Borneo: primary schools 217, pupils 20,674; secondary 17, pupils 650; 1 vocational school. Sarawak: government schools 45, pupils 3,641; local authority schools 74, pupils 2,868; mission schools 69, pupils 7,988; Chinese schools 216, pupils 26,365. Brunei: primary school attendance 4,661.

Finance and Foreign Trade.—Monetary unit: Malayan dollar, valued at 32.67 cents U.S. in 1952.

	North Borneo	Sarawak	Brunei
	(In millions of Malayan dollars)		
Budget (1952 est.)			
Revenue	21.1	39.5	69.3
Expenditure	15.6	31.3	17.9
Imports (1951)	70.2	383.7	50.4
Exports (1951)	113.7	508.3	271.8

Principal production figures (1951): North Borneo, rubber (exports) 21,698 tons, rice 24,000 tons, copra 12,456 tons; Sarawak (exports), crude oil 3,206,152 tons, refined petroleum 1,741,446 tons, rubber 42,521 tons, timber 54,528 tons; Brunei, crude oil 37,133,500 bbl., rubber 5,161,694 lb.

British Columbia. Third largest and the most westerly of Canada's ten provinces, British Columbia has an area of 366,255 sq.mi. of which 6,976 sq.mi. are water. It is bounded on the west by the Pacific ocean; on the south by the states of Washington, Idaho and Montana; on the east by the province of Alberta; and on the North by Alaska, Yukon and the Northwest Territories.

The population, as taken for the 1951 census at June 1, was 1,165,210 (1941 census, 817,861). The estimated population at June 1, 1952, was 1,198,000. The 1951 census indicated 371,739 rural dwellers and 793,471 urban dwellers; 596,961 male and 568,249 female residents. About 55% of the population dwelt in the southwestern corner of the province. The chief cities and their 1951 populations were: Vancouver (344,833; metropolitan Vancouver, 530,728); Victoria, the capital (51,331; metropolitan Victoria, 104,303); and New Westminster (28,639).

History.—In the fourth session of the 22nd parliament of British Columbia, February 19 to March 26, 1952, the following measures were passed: an act authorizing the implementation of an agreement between the federal government and the province in regard to payments for the rental of certain tax fields; an act authorizing the borrowing of \$6,050,000 for the building and equipping of public buildings; an act allowing for the appropriation of a part of revenue surpluses for the building of public buildings, roads and bridges; and an amendment to the oleomargarine act of 1949 allowing the sale of coloured oleomargarine within the province.

On Jan. 19, 1952, Premier B. I. Johnson tendered the resignations of the three Progressive Conservative cabinet ministers which, in effect, dissolved the coalition government of Liberals and Progressive Conservatives.

In January, P. E. George, former mayor of Victoria, was appointed chairman of the public utilities commission, following the death of W. A. Carrothers, former chairman.

Tolls on the Pattullo bridge at New Westminster ceased on Feb. 12, saving the public an estimated \$900,000 per year. In February the province negotiated a \$30,000,000 loan in the United States.

In March it was announced that the province would spend about \$32,000,000 on roads and bridges during 1952-53. In April it was announced that West Coast Transmission would construct a \$100,000,000 natural gas pipe line from Alberta through central British Columbia to the lower mainland. In May it was recommended that a forest management licence be granted to Celgar Development Co., Ltd., to establish a \$65,000,000 integrated forest industry in the Arrow lakes region. On June 10 Vancouver Island's first newsprint plant, a \$21,000,000 plant at Duncan Bay, started production.

On June 12, 1952, a provincial election was held with the following party standings, with previous standings in parentheses: Social Credit 19 (0); Liberal 6 (23); Progressive Conservative 3 (11); Co-operative Commonwealth Federation 18 (8); Labour 1 (1); Coalitionist 0 (3); Independent 0 (2); vacancy 1 (0). The majority of voters favoured adoption of daylight saving and broadening of the liquor act.

On Aug. 8 it was announced by Premier W. A. C. Bennett that hospital insurance premiums would be reduced from \$42 to \$39 for married persons and from \$30 to \$27 in the case of single persons; the coinsurance policy of \$35 maximum per year was changed, so that a payment of \$1 per hospital day was charged with no maximum.

In October Imperial Oil Ltd., Sarnia, Ont., commenced refining oil from Alberta's Leduc field in commercial quantities at its Ioco, B.C., plant.

Members of the provincial executive council, or cabinet, and their portfolios at the close of 1952 were: W. A. C. Bennett, premier and president of the council; W. D. Black, provincial secretary and municipal affairs; R. W. Bonner, attorney general; R. E. Sommers, lands and forests and mines; E. M. Gunderson, finance; K. Kiernan, agriculture; P. A. Gagliardi, public works; R. Chetwynd, railways, trade and industry and fisheries; L. Wicks, labour; E. Martin, health and welfare; Mrs. T. Rolston, education.

Education.—During the school year ending June 30, 1951, 173,354 students were enrolled in the elementary (109,094), elementary-senior-junior high (12,992), superior (1,997), junior, junior-senior and senior high (49,271) schools of the province. Teaching staffs comprised 6,272 teachers as follows: in the elementary 3,522; elementary-senior-junior high 477; superior 87; junior, junior-senior and senior high 2,143; and 43 unclassified. Higher education is provided by the University of British Columbia, Vancouver (attendance 1951, 6,432), a provincially endowed institution, two teacher-training schools located in Vancouver and Victoria, a vocational institute at Vancouver and a junior college at Victoria.

The total net cost for the enrolment of 173,354 was \$51,099,914. The deputy minister and superintendent of education was F. T. Fairey.

Table I.—Economic Activity in British Columbia

	Unit	1951	1950	1952 Preliminary estimates
AGRICULTURE:				
Total value of production	\$	155,000,000	136,690,400	160,000,000
Livestock	\$	27,000,000	24,144,000	
Poultry products	\$	20,000,000	16,976,000	
Dairy products	\$	32,000,000	30,821,000	
Fruits and vegetables	\$	30,000,000	28,384,600	
Field crops	\$	38,000,000	28,518,000	
Miscellaneous	\$	8,000,000	7,846,800	
FISHERIES:				
Total value of production	\$	83,000,000	68,821,358	81,000,000
Pack of canned salmon	cases	1,955,475	1,482,560	1,950,000
FORESTRY:				
Total value of production	\$	504,807,930	468,371,142	520,000,000
Timber scaled	M.B.M.	4,696,347	4,560,080	4,600,000
Paper production	ton	484,581	477,628

Communications.—The total highway mileage as of March 31, 1951, excluding the Alaska highway, was 22,509 of which 10,414 mi. were surfaced, 10,087 mi. were improved earth and 2,008 mi. unimproved earth. Railway mileage as of Dec. 31, 1951, was 4,773 of main line track and 1,221 of sidings. During 1951 approximately 6,542,254 tons of cargo were loaded at British Columbia ports on vessels destined to foreign countries, while 3,028,605 tons of cargo received from foreign countries were unloaded at local ports. In 1950 the total number of telephones was 277,341; this included 111,413 on automatic switchboards.

On Oct. 31, 1951, there were 207,230 passenger cars and 70,270 commercial vehicles registered within the province.

Finance.—On March 4, 1952, B. I. Johnson, premier and minister of finance, reported that revenue collected for the fiscal year ended March 31, 1951, was \$124,029,000; expenditures were \$116,079,000; the net debt at Dec. 31, 1951, was \$191,091,839, an increase of \$19,879,849. Anticipated revenues were \$141,986,869 and expenditures \$141,905,433 for the fiscal year ending March 31, 1953.

Table II.—Principal Manufacturing Industries of British Columbia

Industry	Gross value of Products 1950	1949
Sawmills	\$293,022,294	\$209,607,511
Pulp and paper	86,886,870	69,925,185
Fish processing	67,728,992	55,533,356
Slaughtering and meat packing	50,883,632	49,120,931
Petroleum products	38,675,270	34,409,015
Sash, door and planing mills	34,070,701	26,522,103
Veneers and plywoods	30,047,542	25,239,202
Miscellaneous food industries	28,668,471	23,057,601
Fertilizers	27,745,806	28,060,751
Fruit and vegetable preparations	24,307,003	22,622,366
Total all manufacturing industries	1,133,016,956	959,008,088

Agriculture, Fisheries, Mining, Forestry.—Preliminary provincial departmental estimates indicated that all four chief basic industries, viz., agriculture, forestry, fisheries and mining, would just about maintain the highs established during 1951. Price increases were more moderate during 1952, being approximately 3% higher than in 1951. During 1952 there was considerable concern regarding the marketing of lumber products, apples, and fish products, especially to the United Kingdom market.

Manufacturing.—Preliminary statistics relating to the manufacturing industries of the province indicated that the 1951 gross value of production would be higher than the previous all-time high established during 1950. This new all-time high was well maintained during 1952 with increased production in the pulp and paper and chemical industries. Many existing manufacturing plants in British Columbia added additional capacities to already existing plants during 1952. (G. T. H.)

British East Africa. This term is used to include Kenya, a colony and protectorate; Somaliland, protectorate; Tanganyika, trust territory; Uganda, protectorate; and Zanzibar, protectorate, comprising the islands of Zanzibar and Pemba. Areas, population and chief towns are in the accompanying table.

The East Africa High commission, comprising the governors of Kenya, Tanganyika and Uganda, administers the public utilities and other central services of these territories, and has power to legislate, with the advice and consent of a central legislative assembly. Governors (Dec. 31, 1952): Kenya, Sir Philip Mitchell; Somaliland, Sir Gerald Reece; Tanganyika, Sir Edward Twining; Uganda, Sir Andrew Cohen. Zanzibar: ruler, Sultan Khalifa bin Harub; resident, John Rankine. East Africa High commission: chairman, Sir Philip Mitchell.

	Area (sq. mi.)	Pop. (1951 est.)	Chief towns (pop. 1948 census)
Kenya	224,960	5,680,000	Nairobi (cap., 119,489), Mombasa (port, 84,746)
Somaliland	67,936	500,000	Hargeisa (cap., 30,000*), Berbera (port, 15,000 (hot season), 30,000 (cold season)*)
Tanganyika	362,688	7,827,000	Dar es Salaam (cap., 69,277)
Uganda	93,981	5,187,000	Entebbe (cap., 6,000*)
Zanzibar	1,020	273,000	Zanzibar (cap., 45,275)

*1952 est.

History.—*Kenya.*—Early in Feb. 1952 Princess Elizabeth and the duke of Edinburgh arrived by air at Nairobi en route to Ceylon and Australia and received an enthusiastic welcome from all communities. After a few days of crowded engagements they went to their hunting lodge at Nyeri. There they received, on Feb. 6, the tragic news of the king's death. The queen and the duke left immediately by air for the United Kingdom.

A. T. Lennox-Boyd, then minister of state for the colonies, had visited Kenya in January and held discussions with the leaders of the various communities. Elections for the new Kenya legislative council were held in May; the council met in June, with an interim composition of 26 official and 28 unofficial members. E. Mathu, leader of the African unofficial members, was appointed to the executive council.

The expansion and reorganization of port facilities at Mombasa had made such progress that by August 100,000 tons of cargo were being handled each month and shipping delays eliminated.

During the year the incidence of crime in the towns, particularly Nairobi, and the lawless conduct of the Kikuyu in the Nyeri and Nanyuki areas under the influence of the anti-European Mau Mau secret society led to firm government action. In April five Kikuyu villages were collectively fined £2,500 for suppressing evidence in cases of hut burning instigated by this society. In August a remarkable demonstration by Kikuyu Christians, both Protestant and Roman Catholic, took place. At a mass meeting at Kiambu they united in condemning Mau Mau and in promising the government every support in suppressing it.

Somaliland.—An investigation into irrigation possibilities in

Somaliland protectorate in 1951 had been sufficiently encouraging to justify a Colonial Development and Welfare grant for a hydrological survey being planned in 1952. The establishment of local government in the protectorate had been started in 1951, and there were 130 local authorities, as well as district advisory councils and welfare committees, in operation in 1952. Intertribal raiding over the Ogaden frontier had, however, not entirely ceased.

Tanganyika.—The minister of state for the colonies visited Tanganyika in Jan. 1952 and emphasized that the Conservative and Labour parties in Great Britain were agreed on the policy to be followed in the political development of Tanganyika; and in June the secretary of state announced that the British government accepted the proposals made by the Tanganyika Constitutional Development committee in 1951 for racial parity between European, African and Asian unofficial members in the legislative council. The new council, however, was not to be formed for about five years in order to give time for the full establishment of the reformed system of local government and for experience in its working.

Good rains resulted in good crops in Tanganyika, but considerable damage was done to sisal in the Southern province by a cyclone which struck the Mikindani area on April 15. About 30 Africans lost their lives. The Rufiji rice-growing scheme, based on the hiring of tractor-drawn plows to African farmers, made big strides and about 6,000 ac. were being brought under cultivation. At Moshi, in March, the governor opened the new £200,000 business and community centre of the Chagga Co-operative union of coffee growers.

Diamond exports from Tanganyika, suspended for several months during negotiations about marketing between J. Williamson, discoverer and owner of Madui diamond mine, and the Diamond corporation, were resumed in June. A fillip was given to the production of lead and copper by the grant of a loan of \$1,640,000 by the U.S. government to Uruwira Minerals, Ltd.

Uganda.—In June 1952 the Uganda executive council was enlarged by the appointment of four more unofficial members, of whom one was European, one Indian and two African. The building of the dam across the Nile at Jinja made good progress, and it was expected that one generating unit would be operating by Sept. 1953 and three more by the middle of 1954. Textile, cement and other industries would be developed with power from this source as would be the mining projects at Kilembe and Tororo. The former, in the west of the protectorate, was based upon an extensive deposit of copper and cobalt. Production would begin in 1955, the copper being smelted on the spot. Meanwhile the Mombasa-Kampala railway was being extended to Kilembe; a considerable area of undeveloped agricultural land would be opened up in the process. In the east, at Tororo, extensive limestone deposits, which included a valuable mineral complex of phosphorus, niobium and other ores, were to be developed. These deposits were close to the railway and at the end of a power line from the Jinja dam.

Legislation was introduced at the end of the year imposing an export duty on coffee, and virtually restricting the opening of new curing works and hulleries to those approved for operation by African growers and co-operatives. A Coffee Industry board was also established. The reorganization of the cotton ginning industry continued. The Uganda government took steps during the year to accelerate the development of technical education. In June two expeditions, one British and one Belgian, started jointly to explore and make a geological map of the Ruwenzori range (the Mountains of the Moon).

Zanzibar.—The 1951-52 Zanzibar clove crop was very poor after a bumper yield the year before, and the prospects for 1952-53 were not very good either. The poor clove crop and a

sharp drop in the prices of coconut products caused a general economic recession and severely affected revenue. Instead of showing a surplus as in recent years the budget for 1952 was likely to show a substantial deficit. However, efforts were being made to diversify the islands' economy and, in 1952, grants of more than £50,000 were made from Colonial Development and Welfare funds for the building of a pineapple factory and the expansion of the citrus industry.

Finance and Trade.—Monetary unit: East African shilling, divided into 100 cents, valued at parity with the shilling sterling and at 14 cents U.S. (1952).

	Revenue (1952 est.)	Expenditure (1952 est.)	Imports (1951)	Exports (1951)
Kenya	£16,219,906	£12,737,447	£53,328,000	£24,068,000
Somaliland	1,227,652*	1,227,652	1,635,656	894,422
Tanganyika	12,869,835	12,769,460	31,642,000	41,497,000
Uganda	12,947,501	12,103,563	22,436,000	47,197,000
Zanzibar	1,518,831	1,426,520	5,217,000	6,184,000

*Including £599,427 grant-in-aid.

Principal exports: *Kenya*—wheat, maize, sisal, pyrethrum, tea, gold, silver, kyanite; *Somaliland*—hides, skins, gums, livestock, ghee; *Tanganyika*—diamonds (1951 provisional £847,832), textiles, fibres, lint (£26,660,723), hides (£1,805,010); *Uganda*—raw cotton, sugar; *Zanzibar*—cloves, coconut oil, oil cake.

British Empire: see COMMONWEALTH OF NATIONS.

British Guiana. A British colony, British Guiana is located in northeast South America between Venezuela, Brazil and Surinam. Area: c. 83,000 sq.mi. Pop.: (1946 census) 375,701, including 16,322 Amerindians, 143,385 Negroes and 163,434 East Indians; (1951 est.) 431,000. Language: English; various East Indian languages. Religion: Christian (60%); Hindu (30%); Moslem (8%). Principal towns (pop., 1950 est.): Georgetown (cap., 84,794); New Amsterdam (11,812). Governor in 1952, Sir Charles Woolley.

History.—Final details of the new constitution, which brought British Guiana into line with the more advanced British Caribbean colonies, were disclosed in 1952. It was expected that general elections with full adult suffrage would be held in the first half of 1953. The list of voters was prepared. The legislature voted in favour of participation in a West Indian customs union, but rejected on principle the proposals for a British West Indian federal government.

The report of a committee appointed to inquire into the cost of primary education aroused great interest. Two recommendations—that the school entry age be raised from five to six and that a double shift system be introduced to make the maximum use of available resources—met with strenuous criticism.

Both sugar and rice production increased in comparison with the previous year's. The government announced the formation of a company with authorized capital of B.W.I. \$10,000,000 for further development of the rice industry. Production of bauxite, gold and diamonds also rose. A large-scale water control scheme gave security to coastland farmers in a district of growing commercial importance. A preliminary mission of the International Bank for Reconstruction and Development visited the colony. A full-scale mission was expected to follow it.

Education.—Elementary school pupils (1951), 77,907; expenditure on elementary education B.W.I. \$2,274,875.

Finance and Trade.—Monetary unit: British West Indian dollar valued in 1952 at 58.33 cents U.S. Budget (1952 est.): revenue B.W.I. \$25,586,402; expenditure B.W.I. \$25,297,994, exclusive of colonial development funds. Foreign trade (1951): imports B.W.I. \$65,000,000; exports, including re-exports, B.W.I. \$58,560,024. Principal exports: sugar, bauxite, rum, rice, diamonds, timber, balata. Production: sugar crop (1952) 217,306 tons; bauxite (1951) 2,002,744 tons. (P. H.-My.)

British Honduras. A British colony in Central America bounded by Mexico and Guatemala, British Honduras has an area of 8,598 sq.mi. Pop.: (1946 cen-

sus) 59,220, including 10,030 Amerindians; (1951 est.) 69,644. Language: English; Spanish and Indian dialects. Religion: mainly Roman Catholic. Chief towns (pop., 1946): Belize (cap., 21,886), Stann Creek (3,414). Governors (1952): Sir Ronald Garvey and (from March 24) Patrick Renison.

History.—The post-World War II development program entered a further stage during 1952 with a grant of another £800,000 from funds established under the Colonial Development and Welfare acts. This was mainly earmarked for agricultural development following the opening up of the country by the construction of feeder roads during the first phase of the development program. The Stann Creek district had land communication with the capital. There was considerable citrus development in this district; citrus exports from the colony reached a value of \$731,916 in 1951, an increase of more than \$200,000 from the previous year.

The Colonial Development corporation's project for growing ramie fibre in the western district seemed promising. In the Stann Creek valley, the corporation had 1,800 ac. under bananas and regular monthly shipments were being made to the United Kingdom. The corporation livestock project proved disappointing and it was decided to abandon it. Private cattle owners in the area were considering a pilot scheme to replace the stock farm which had been established by the corporation. The corporation's Fort George hotel was completed at the end of 1952.

In June the legislative council decided that the colony was not prepared to commit itself on a West Indian federation and expressed the view that public feeling in the colony was against it. In July proposals for a new constitution were passed by the legislative council and forwarded to the secretary of state for the colonies. They included universal adult suffrage and an elected majority on the legislative council.

Education.—Grant-aided primary schools 92 (including 65 controlled by the Jesuit mission), pupils 9,888; secondary schools 5, pupils 1,685; one technical school.

Finance and Trade.—Currency: British Honduras dollar, valued in 1952 at 70 cents U.S. Budget (1952 estimate): revenue \$5,028,935; expenditure \$5,094,101. Foreign trade (1951): imports \$12,407,332; exports \$6,234,131. Principal exports: timber, coconuts, chicle and grapefruit.

(P. H.-My.)

British Malaya: see MALAYA, FEDERATION OF; SINGAPORE.

British Somaliland: see BRITISH EAST AFRICA.

British South African Territories. The three territories in southern Africa which are not part of the Union of South Africa, Basutoland (colony), Bechuanaland protectorate and Swaziland (protectorate), are generally referred to as the High Commission Territories in South Africa.

	Area (sq.mi.)	Population (1946 census)	Population (1951 est.)	Capital (with approx. 1952 pop.)
Basutoland	11,716	556,390	578,000	Maseru (3,400)
Bechuanaland	c.275,000	293,920	290,000	
Swaziland	6,704	185,215	200,000	Mbabane (1,600)

*Administrative headquarters are in special reserve at Mafeking, Cape province, Union of South Africa.

High commissioner in 1952, Sir John Le Rougetel. Resident commissioners: (Basutoland) E. P. Arrowsmith; (Bechuanaland) E. B. Beetham; (Swaziland) D. L. Morgan.

Basutoland.—Revenue rose during 1952, mainly as a result of relaxation of the import restrictions previously imposed by the Union of South Africa government to improve the balance of external payments. But the steady rise in prices raised the costs of administration and absorbed the additional revenue.

The aerial survey of the colony was continued, but its completion was delayed by unforeseen difficulties in the ground-control triangulation which lacked reliable Basuto heliograph operators.

Work proceeded slowly on the construction of the new moun-

tain motor road into the heart of Basutoland from Maseru to Marakabei and Ntaotes.

The first trade union was registered officially, the Basutoland Typographical Workers' union, which organized men employed by the mission printing presses.

The report was published of a unique agricultural survey conducted on scientific lines by A. J. A. Douglas and R. K. Tennant, in order to measure actual and potential production on typical holdings.

Bechuanaland.—It was announced in March in both houses at Westminster that the previous refusal to recognize Seretse Khama as chief of the Bamangwato was permanent and final, and that he could not return from exile until a new chief had been firmly established. Lord Salisbury later received in London a delegation from the tribe, but refused to alter his decision. Unrest continued in the territory and on June 1 serious disturbances broke out; police reinforcements were rushed to the affected areas. In the riots three African policemen were killed and several officials and police injured. Later 26 tribesmen and 10 women were put on trial for murder and public violence. The banishment order against Tshekedi Khama, former regent of the tribe, was subsequently withdrawn and he returned as a private individual.

Swaziland.—The drought which afflicted southern Africa reduced maize yields considerably. In view of the increasing consumption of maize, the administration was greatly concerned at the prospect of a shortage later in the season, especially in the low-veld areas, and plans were considered to meet the situation. The banana plantations at Kubuta began production and exports increased steadily. Agricultural exports generally were about 50% more than in the previous year, despite the drought, and further increase was expected.

The presence of metal zinc, suspected for some time, was confirmed. It occurs as zinc sulphide in association with barytes. Geological mapping continued, the area mapped reaching almost 40% of the whole territory.

A loan of £44,000 was raised to buy heavy road equipment to meet the most pressing demands for road construction.

A new European primary school was built at the headquarters of the Usutu forests project. (See also SOUTH AFRICA, UNION OF.) (J. L.)

Education.—Schools, with the numbers attending in parentheses, were in 1951:

	Primary	Secondary and postprimary	European
Basutoland	889 (88,247)	10 (1,151)	7 (128)
Bechuanaland (1950)	152 (16,346)	1 (34)	9 (224)
Swaziland	207 (15,035)	13 (416)	11 (705)

A small private university from which students took external degrees of the University of South Africa was maintained by the Roman Catholic mission at Roma, Basutoland.

Finance and Trade.—Monetary unit: South African pound (£S.A. 1 = £1 sterling).

	Budget est., 1952-53 Revenue*	Expenditure*	Foreign trade, 1951 Imports	Exports
Basutoland	£1,117,087	£1,147,214	£2,836,049	£2,752,054
Bechuanaland	699,352	768,889	1,674,372	2,153,365
Swaziland	620,600	614,747	1,878,984	2,639,765

*Excluding Colonial Development fund expenditure estimated for the year at: Basutoland £129,235, Bechuanaland £167,746, and Swaziland £142,074. Deficits to be met from accumulated surpluses.

Principal exports: *Basutoland* livestock, grain, wool hides and skins; *Bechuanaland* beans, dairy produce, livestock, hides and skins, gold; *Swaziland* livestock, tobacco, asbestos (34,964 short tons in 1951), gold, peanuts, tung oil.

British West Africa. This term includes the following British territories on the west coast of Africa: Gambia, colony and protectorate; Gold Coast, colony and protectorates, with which Togoland, under United Kingdom trusteeship, is administered; Nigeria, colony and protectorate,

with which Cameroons under U.K. trusteeship are administered; Sierra Leone, colony and protectorate. Areas, populations and chief towns are given in the accompanying table.

Governors (Dec. 31, 1952): Gambia, Sir Percy Wyn Harris; Gold Coast, Sir Charles Arden-Clarke; Nigeria, Sir John Macpherson; Sierra Leone, Sir George Beresford-Stooke. Prime minister, Gold Coast: Kwame Nkrumah.

	Area (sq.mi.)	Population (1951 est.)	Chief towns
Gambia	4,074	279,297*	Bathurst (cap., 21,152†)
Gold Coast	78,802	4,333,000	Accra (cap., 135,926‡), Kumasi (78,483‡), Sekondi-Takoradi (44,557‡)
Togoland	13,041		...
Nigeria	338,593	25,000,000	Lagos (cap., 230,000§), Ibadan (335,500), Kano (102,000)
Cameroons	34,081	1,000,000	...
Sierra Leone	27,925	1,891,000	Freetown (cap., 64,576‡)
*1951 census.	†1944 census.	‡1948 census.	§African pop., 1950 census.
African pop., 1949 est.			

History.—Three notable pan-West African gatherings took place during the year: the seventh conference of directors of public works at Freetown, Sierra Leone, in February; a fisheries conference at Kissy, in the same colony, on April 22; and the first meeting of the West African Inter-Territorial conference at Accra, Gold Coast, in July, under the chairmanship of the governor of Nigeria. The Inter-Territorial conference, which consisted of eight members drawn equally from the Nigerian council of ministers, the Gold Coast cabinet and the executive councils of Gambia and Sierra Leone, dealt mainly with inter-territorial and international collaboration in west African research, economy and social affairs.

Gambia.—In Feb. 1952 it was announced that two elected members of the legislative council had been appointed as members of the government without portfolio.

Early in 1952 the Colonial Development corporation sent a mission to review the progress of the irrigated rice scheme, for which capital sanction of £1,115,000 had been given in Feb. 1950. By the end of 1951 £300,000 had been spent on irrigation and drainage works.

Gold Coast.—The 1952 session of the legislative assembly was opened on Jan. 29 by the governor. Local government elections started in April. In March an amendment to the constitution provided for the replacement of the leader of government business by a prime minister taking precedence next after the governor. Kwame Nkrumah became prime minister on March 21.

It was announced that when proposals for self-government within the Commonwealth of Nations had been formulated by the colony's government after consultation with the chiefs and the people, they would be examined and discussed jointly by the British and Gold Coast governments. In August the visiting mission of the United Nations Trusteeship council arrived in Togoland.

In April a mineral duty ordinance applied the broad principles of gold duty to all minerals, including bauxite, which had not been taxed hitherto. The object was to increase the tax paid by the mining industry while continuing to assist lower grade mines.

In April it was announced that work was to start on a new harbour at Tema, 18 mi. E. of Accra. The sum of £20,750,000 was approved by the assembly for the port and town and ancillary road and rail connection. In May talks took place in London between Gold Coast ministers, representatives of the U.K. government, Aluminium Ltd. of Montreal and the British Aluminium company, on the Volta river project which Tema harbour would serve. The projected works were a dam, a hydro-electric plant and an aluminum plant. The estimated cost of the scheme, apart from the mines and the aluminum plant, was £80,000,000.

Nigeria.—The general election was not complete by the end

of 1951 and it took some time for the final pattern to emerge. In the northern region house of assembly the Northern People's Congress, mainly traditional and conservative in outlook, had an overwhelming majority. In the eastern region the National Council of Nigeria and the Cameroons was able to attract a sufficient number of independents to give it control of the assembly of 80. In the central "federal" house of representatives all the eastern region members were N.C.N.C. supporters; but, although the Action group dominated the western region house of assembly, the western group in the house of representatives included three seats allotted to members of the house of chiefs and two to representatives of Lagos where only N.C.N.C. members were returned. However, Nnamdi Azikiwe, leader of the N.C.N.C., was not chosen as one of the Lagos representatives in the central house and Awolowo, leader of the Action group, elected to lead his party in the western ministry instead of accepting a central ministry.

The principal development in the local government field was the introduction of a bill in the western region house of assembly providing for the creation of divisional councils and for local government inspectors whose duties would be performed by the former residents and district officers. British officers were also to be seconded as clerks of the councils. The general effect of this legislation was to bring the system of local government in the western region more or less into line with the system on the British model already operating in the eastern region. The Niger county council in the eastern region was inaugurated on April 10.

Sierra Leone.—In March 1952 Bankole Bright, leader of the National Council of Sierra Leone, led a deputation to London to protest against the new constitution, under which the legislative council had first met in Nov. 1951. His party had gained five out of the seven Freetown seats; 16 seats in the colony and protectorate had been won by the Sierra Leone People's party. The creoles of the colony therefore felt that they were being swamped by representatives of the comparatively illiterate peoples of the protectorate.

Finance and Trade.—Monetary unit: West African pound (£1=£1 sterling=280 cents U.S.).

Brownell, Herbert, Jr. (1904-), U.S. political leader, was born on Feb. 20 at Peru, Neb. He received his bachelor's degree at the University of Nebraska, Lincoln, in 1924 and his law degree at Yale university in 1927. He practiced law in New York city, and in 1932 was elected as a Republican to the New York state assembly where he served two terms. In 1942 he was campaign manager for Thomas E. Dewey in the latter's successful bid for the governorship of New York. Brownell also managed Dewey's campaigns for the Republican presidential nomination in 1944 and 1948 and was chairman of the Republican national commit-

tee from 1944 to 1946. He was an early supporter of Gen. Dwight D. Eisenhower and key strategist in the latter's campaigns for presidential nomination and election in 1952. Eisenhower on Nov. 21, 1952, named Brownell attorney general in his cabinet.

Budget, National. **United States.**—In a statement dated Aug. 19, 1952, Pres. Harry S. Truman reviewed the changes in the budget of the United States for the fiscal year ending June 30, 1953, which had taken place since its original transmission to congress the previous January. This review was a reappraisal of the government's financial program for the fiscal year 1953. It presented revisions of the original fiscal 1953 estimates in the light of new obligational authority already enacted, anticipated supplemental appropriations that were to be submitted to the next session of congress, and amendments to the budget which had been made since January. In addition, the review provided actual expenditure and receipts data (instead of estimates) for the fiscal year 1952.

Budget expenditures for fiscal 1953 were estimated at \$79,000,000,000, which was \$6,400,000,000 below the total submitted in Jan. 1952. Budget receipts were estimated at \$68,700,000,000, down \$2,300,000,000 from the January estimate. On the basis of these revised figures, a budget deficit of \$10,300,000,000 was anticipated for the fiscal year 1953—\$4,100,000,000 lower than the figure in the original budget message. In the fiscal year 1952 there was a budget deficit of \$4,000,000,000; in the previous year there had been a surplus of \$3,500,000,000.

The revised expenditure total for fiscal 1953 represented an increase of about \$13,000,000,000 over fiscal 1952 and of about \$39,000,000,000 over fiscal 1950, the last full year before the outbreak of the Korean conflict. The revised estimate of budget receipts for 1953 was \$6,600,000,000 higher than actual receipts in 1952.

"SCRAPING BOTTOM," a 1952 cartoon by Pratt of the McClatchy Newspapers

The president noted that nearly 74% of total budget expenditures in the fiscal year 1953, or \$58,200,000,000, was earmarked for six "major national security programs"—military services, international security and foreign relations, atomic energy, defense production and economic stabilization, civil defense and maritime activities. Expenditures for these programs accounted for all of the increase in total budget expenditures since the attack on Korea.

An additional 14% of the revised budget, or \$10,900,000,000, was comprised of interest and veterans' benefits. All other activities of the government accounted for the remaining 12%, or \$9,900,000,000.

Military Services.—Expenditures for military services, including foreign military assistance, were estimated at \$52,900,000,000 for the fiscal year 1953 in the revised budget. This amount comprised two-thirds of the over-all budget total. It was about \$11,600,000,000 above military outlays in fiscal 1952 and accounted for nearly all of the projected increase in the 1953 budget.

Most of the expenditures in the military services category were allocated for military functions of the department of defense. The rate of such defense department expenditures, it was said, was expected to reach a peak in the latter part of the fiscal year 1953, and then level off for a time before moving to lower levels.

The later estimate of expenditures for military services in fiscal 1953 was \$6,300,000,000 below the original estimate. This downward revision was attributed to reductions in appropriations and some slowing of military production resulting from the work stoppage in the steel industry.

International Security and Foreign Relations.—Expenditures for international security and foreign relations (excluding foreign military assistance) were estimated at \$2,376,000,000 in the fiscal year 1953 compared with \$2,829,000,000 in fiscal 1952. Most of the reduction was for foreign economic assistance. Appropriations for this program had been cut substantially below the original budget request in Jan. 1952.

Finance, Commerce and Industry.—For programs embraced under the heading of finance, commerce and industry, expenditures in fiscal 1953 were expected to total \$375,000,000. The bulk of the increase over outlays of \$170,000,000 in 1952 was in programs relating to the expansion of defense production.

Expenditures for price, wage and rent controls were placed at \$62,000,000, sharply below the January estimate of \$149,000,000. Appropriations for these programs were substantially reduced by congress, which specified that they should be ended on April 30, 1953.

Transportation and Communication.—Expenditures for transportation and communication programs were estimated at \$1,863,000,000 for fiscal 1953 compared with \$2,017,000,000 in the preceding year. The decline largely reflected an anticipated reduction in the postal deficit.

Natural Resources.—The government's programs to conserve and develop natural resources were estimated to require expenditures of \$3,644,000,000 in fiscal 1953. The increase of about \$700,000,000 over the 1952 total was accounted for by outlays for atomic energy, which formed more than three-fifths of all expenditures in this category.

Agriculture and Agricultural Resources.—Expenditures for operating government programs relating to agriculture and agricultural resources were estimated at \$1,804,000,000 for fiscal 1953 compared with \$1,042,000,000 in fiscal 1952. This increase was almost entirely the result of anticipated higher expenditures for farm price support. During the fiscal year 1952, the Commodity Credit corporation had sold more price support commodities than it acquired.

TAGGED CLOTHING worn by two soldiers to show troops at Ft. Benning, Ga., the cost of each part of their uniforms in 1952. Total cost for the two sets of clothing was \$97.41

In fiscal 1953, however, it was expected that higher production from the 1952 crops would increase the national carry-over and that the corporation, through loans and purchases, would add substantial amounts of price support commodities to its inventories.

Labour.—For the fiscal year 1953, expenditures required for administering labour programs were placed at \$248,000,000—\$4,000,000 more than in the previous year. Three-fourths of the total consisted of direct grants to the states for the administration of the employment services and unemployment insurance systems.

Housing and Community Development.—Budget outlays for housing and community development were estimated, on balance, to decline from \$786,000,000 in fiscal 1952 to \$657,000,000 in fiscal 1953. This decline reflected the anticipation that in 1953 public housing programs would realize substantial net receipts, instead of incurring net expenditures.

However, expenditures for defense housing and community facilities and for civil defense activities were scheduled to increase sharply.

Education and General Research.—Expenditures for education and general research in the fiscal year 1953 were estimated at \$263,000,000, or \$84,000,000 higher than actual outlays in 1952.

The increase was attributed chiefly to a large rise in school enrolments in areas affected by mobilization activities.

Social Security, Welfare and Health.—Expenditures for social

security, welfare and health were estimated at \$2,667,000,000 in the revised budget, \$64,000,000 more than in the fiscal year 1952. The 1953 total included allowance for an anticipated supplemental appropriation of \$145,000,000 required under new legislation raising federal contributions to the states for public assistance beginning Oct. 1, 1952.

Table I.—Summary of Budget Receipts and Expenditures, United States
Fiscal Years 1951 through 1953

Description	Actual, 1951	Actual, 1952	Estimate, 1953
Budget receipts:			
Direct taxes on individuals	\$24,095,000,000	\$30,713,000,000	\$33,542,000,000
Direct taxes on corporations	14,388,000,000	21,467,000,000	24,800,000,000
Excise taxes	8,693,000,000	8,893,000,000	9,624,000,000
Employment taxes	3,940,000,000	4,573,000,000	4,678,000,000
Customs	624,000,000	550,000,000	550,000,000
Miscellaneous	1,629,000,000	1,803,000,000	1,750,000,000
Deduct:			
Appropriations to federal old-age and survivors insurance trust fund	3,120,000,000	3,569,000,000	3,708,000,000
Refunds of receipts (excluding interest)	2,107,000,000	2,302,000,000	2,500,000,000
Total budget receipts	48,143,000,000	62,128,000,000	68,736,000,000
Budget expenditures:			
Military services, including foreign military assistance	21,387,000,000	41,253,000,000	52,868,000,000
Veterans' services and benefits	5,339,000,000	4,821,000,000	4,479,000,000
International security and foreign relations, excluding foreign military assistance	3,802,000,000	2,829,000,000	2,376,000,000
Social security, welfare and health	2,380,000,000	2,603,000,000	2,667,000,000
Housing and community development	602,000,000	786,000,000	657,000,000
Education and general research	115,000,000	179,000,000	263,000,000
Agriculture and agricultural resources	650,000,000	1,042,000,000	1,804,000,000
Natural resources	2,051,000,000	2,938,000,000	3,644,000,000
Transportation and communication	1,685,000,000	2,017,000,000	1,863,000,000
Finance, commerce and industry	176,000,000	170,000,000	375,000,000
Labour	228,000,000	244,000,000	248,000,000
General government	1,209,000,000	1,323,000,000	1,253,000,000
Interest	5,714,000,000	5,940,000,000	6,431,000,000
Reserve for contingencies	—	—	100,000,000
Adjustment to daily treasury statement basis	705,000,000	—	—
Total budget expenditures	44,633,000,000	66,145,000,000	79,028,000,000
Budget surplus	3,510,000,000	—	—
Budget deficit	—	4,017,000,000	10,292,000,000

Detail will not necessarily add to totals because of rounding.

Veterans' Services and Benefits.—The revised budget for the fiscal year 1953 placed expenditures for veterans' programs at \$4,500,000,000, about \$350,000,000 less than in 1952. Although outlays for the education and training of World War II veterans were scheduled to fall sharply in fiscal 1953, expenditures under new legislation were estimated at more than \$500,000,000. This provided for (1) education and training, loan guarantees, unem-

ployment compensation and other benefits for veterans with service since June 27, 1950, and (2) higher compensation and pension rates and liberalized eligibility conditions for non-service-connected pensions.

General Government.—Expenditures for general government services and activities in fiscal 1953 were included in the revised budget at \$1,253,000,000, which was \$70,000,000 less than in the previous year. In the main, this decrease stemmed from the substantial reductions made in appropriations for maintaining and operating government buildings, for supplies and equipment, and for record-keeping activities.

Interest.—Accounting for 8% of total budget expenditures, interest payments by the federal government were expected to amount to \$6,431,000,000 in fiscal 1953. Of this total, \$6,350,000,000 represented interest on the public debt. Because of an increase in the volume of interest-bearing debt and also because of higher interest rates, this latter figure was about \$500,000,000 more than actual outlays in fiscal 1952.

Budget Receipts.—The federal government's two largest sources of revenue—direct taxes on individuals and on corporations—were expected to provide more than \$58,000,000,000 in the fiscal year 1953, or 85% of the estimated total of budget receipts. Excise taxes, the other major source of federal revenue, amounted to about \$9,600,000,000 in the revised 1953 budget. As already noted, the estimated expenditures and receipts for fiscal 1953 would result in a deficit of \$10,300,000,000. (See also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.)

Great Britain.—The 1952-53 budget of Great Britain presented in March 1952 showed total receipts of £4,661,000,000 compared with £4,440,000,000 in the preceding fiscal year. (See Table II.) The bulk of the estimated expansion of receipts in the fiscal year ending March 31, 1953, represented a larger yield from income taxation on both persons and business. Custom and excise collections were also anticipated to be higher.

The imposition of a new excess profits tax, at the rate of 30%, was scheduled to yield little revenue in 1952-53. The estimated rise in business profits taxes stemmed mainly from the effects of tax changes which had been enacted in the previous fiscal year. Since the budget allowed for a reduction in personal tax rates, the increased tax yield shown in this area for 1952-53 reflected the expectation of higher personal income.

Total budget expenditures were scheduled to rise from £4,074,000,000 in fiscal 1951-52 to £4,231,000,000 in 1952-53. As in the preceding year, outlays for defense showed the largest increase. Defense expenditures were projected at £1,377,000,000, compared with £1,112,000,000 in 1951-52. In addition, the cost of servicing the national debt was estimated to rise by £33,000,-

Table II.—Government Receipts and Expenditures—Great Britain

(£ millions)

Receipts			Expenditures		
	Exchequer Receipts, 1951-52	Estimate, 1952-53		Exchequer Issues, 1951-52	Estimate 1952-53

Receipts from sundry loans	25	26			
Miscellaneous (including sale of surplus war stores)	136	110			
Total ordinary revenue	4,440	4,661			

Detail will not necessarily add to total because of rounding.

ooo. Some cutbacks were provided, however, in expenditures for stockpiling of strategic materials, for food subsidies and for national insurance and pension schemes.

The surplus of ordinary receipts over ordinary expenditures was estimated for 1952-53 to be £430,000,000, somewhat larger than the preceding year's surplus of £366,000,000. (C. F. Sz.)

Buhl Foundation: see SOCIETIES AND ASSOCIATIONS, U.S.

Building and Construction Industry. During the first nine months of 1952 the dollar volume of new construction in the United States, \$24,242,000,000, was at the highest level for any comparable period on record. It was 5% above that in 1951 and 19% higher than the Jan.-Sept. 1950 level. In fact the 9-mo. total for 1952 exceeded the total for any 12-mo. period prior to 1950.

Comparing the dollar volume of construction put in place for the first nine months of 1952 and 1951, public construction gained by 20% as major advances occurred in building atomic energy establishments and military and naval facilities. Private construction lagged slightly, showing a decline of 1% because greater outlays in 1952 on private industrial plant and public utility construction did not offset the drop in commercial and some other types of nonresidential building and on housing.

Private construction amounted to \$16,096,000,000, or two-thirds of total new construction put in place. Of this, nonfarm residential accounted for one-half, nonresidential building for somewhat less than one-fourth, and public utilities in excess of one-sixth. One-third of total new construction was financed publicly by federal, state or local bodies and amounted to \$8,146,000,000 during the first nine months of 1952. Of this, considerably more than one-third went for nonresidential building, and one-fourth represented expenditures on military and naval installations.

Construction Costs.—Construction costs, continuing a long-term trend, moved upward slowly during the first half of 1952 but maintained a constant rate of increase. The department of commerce composite index was 4% higher both in January and in June than for the comparable months of the previous year, reflecting general inflationary pressures rather than building material or labour shortages. Disparities were manifest in cost trends among various types of construction. The E. H. Boeckh indexes for residences and for apartments, hotels and office buildings, each showed an increase of 2% during the first six months of 1952.

The cost of heavy construction on the other hand rose 6% according to the *Engineering News Record* index.

Materials Prices and Production.—In June 1952 the building materials wholesale price index was 2% below that of June 1951 but was 10% above the 1950 index and 16% higher than the index for June 1949. The major portion of the decline in the June 1951-June 1952 period occurred in the last half of 1951 with the index holding at a steady level of about 118.0 (1947-49=100) in the first half of 1952. Level price movements characterized virtually all of the major building materials. The primary price index for lumber and wood products remained within a fraction of a point of 120.0 from January to June 1952, heating equipment stood at approximately 114.0, structural clay products at 121.0, and concrete ingredients at 113.0. Decline in the price index of paint and paint materials from 109.3 to 107.0 and a rise in plumbing equipment from 116.6 to 118.1 compensated for each other in the aggregate index of building materials prices.

During the first half of 1952 the composite index of construction materials production was 10% below the first half of 1951, but it exceeded all other January to June periods on record,

INTERIOR VIEW of one of eight model homes tested by the U.S. Housing and Home Finance agency in 1952 for use by defense workers in critical housing areas. This home was prebuilt in three sections by the Pressed Steel Car Company, Inc., and erected at Hegewisch, Ill.

standing 3% and 15% above the comparable periods in 1950 and 1949. Sharpest decreases in the first half of 1952 compared with January to June 1951 were noted in production of warm-air furnaces, which dropped 30%, and in gypsum lath, wire nails and cast-iron soil pipe, each of which declined by approximately 25%. Other major categories of building materials showed production declines ranging from 5% to 15%. The production of lumber, the most important single item in the composite index, was 9% lower in the first half of 1952 contrasted with January-June 1951.

Construction and Materials Controls.—With easing of materials supply in the early months of the year, the National Production authority increased self-authorization of steel from 2 to 5 tons on nonindustrial and nonresidential projects and from 2 to 25 tons on road and highway construction. Restrictions on residential construction were eased to permit greater floor area, increased number of bathrooms and more liberal use of copper and aluminum. In May the NPA lifted bans on recreational buildings and increased permitted amounts of steel, copper and aluminum for commercial and home building. Lead, bismuth, cadmium and antimony were also decontrolled. Before this relaxation order could be effected, however, the steel strike occurred; in June the order was rescinded.

Despite loss of production during the steel stoppage, supplies did not decline to critical levels. The aggregate volume of construction was not appreciably affected. Late in July the NPA removed inventory controls on more than 50 commodities including cast-iron pressure pipe and fittings. In August, 500 tons of finished carbon conversion steel was permitted on authorized construction for the last quarter of 1952 and the first quarter of 1953. The major relaxation that had been announced and then rescinded was reinstituted by the NPA on Oct. 3, 1952. Increases were allowed in volume of materials that might be self-authorized for commercial, multiunit residential and other types of construction, and the ban on recreational building was again lifted. The effective date of this order was to be May 1, 1953, but it was expected that further improvements in the

supply of materials would bring the effective date closer to early 1953.

Employment and Earnings.—During the first half of 1952 building and construction activity provided employment for an average of 2,420,000 workers, a figure only .5% lower than the all-time January to June peak of the previous year. Usual seasonal variations were manifest, employment rising from 2,300,000 in early months to more than 2,700,000 in June 1952.

In early spring construction workers were permitted wage increases of as much as 15 cents an hour by the Wage Stabilization board. In the previous September a 10% increase above hourly rates prevailing on July 1, 1950, had been approved by that agency. The new policy, effective until the end of 1952, also provided that employers might contribute an estimated 7.5 cents an hour to health and welfare plans, but payments into pension funds, annuities and paid holidays would be charged against permitted wage increases.

Table II.—Average Union Wage Scales for Selected Trades, July 1952

Trade	Rate Level			Increase	
	Low	Average	High	July 1951-July 1952 Cents per hour	Per Cent
Bricklayers	\$2.50	\$3.13	\$3.65	23	8
Carpenters	1.93	2.63	3.40	11	4
Electricians	2.20	2.88	3.30	14	5
Painters	1.50	2.57	2.80	16	7
Plasterers	2.25	3.08	3.65	14	5
Plumbers	2.38	2.84	3.25	10	4
Building labourers90	1.74	2.56	8	5

The continuing high level of employment plus WSB authorization contributed to placing average weekly earnings of construction workers at an all-time high—\$88.11 in June 1952. Average hourly earnings for both union and nonunion workers rose to a peak of \$2.25 in March and then declined fractionally by mid-year. An increase in the number of working hours per week, however, more than compensated for this minor decline in hourly rate. In general, the position of construction workers had improved considerably in past years. Weekly earnings in June 1952 were 7% higher than in the previous year, 20% higher

than in 1950 and 23% above those of 1949. At the same time, the consumer price index showed increases of 2% above 1951, 11% over both 1950 and 1949.

Wage rates for all building crafts increased in the year July 1951 to July 1952 but with some variation in both the amount and the proportion of rise. At midyear 1952 average union rates exceeded \$3 an hour straight time for bricklayers and plasterers; unskilled and semiskilled building labourers were receiving an average of \$1.74 per hour.

Credit Regulations Removed.—In Sept. 1952 the board of governors of the federal reserve system withdrew all direct controls on conventional loans for residential and nonresidential building by removing Regulation X. The Housing and Home Finance agency virtually duplicated this move with respect to mortgages

*Joint estimates of the Department of Commerce and the Department of Labor. Estimated construction expenditures represent the monetary value of work put in place during the given period of time.

†Decrease less than 0.5%. ‡Increase less than 0.5%.

insured or guaranteed by the federal government. The removal of Regulation X was expected to have the most influence on commercial building, which had been subject to a maximum permissible loan-to-value ratio of 50%. Mortgages on commercial structures are ordinarily sought by insurance companies and other large institutional lenders because servicing costs are low and yields high. One percentage point difference in interest rate is not so important to a commercial borrower as it is to a family financing its own home. Consequently commercial mortgages can compete favourably with home mortgages and other types of long-term loans.

Paley Report.—The report of the President's Materials Policy commission contained sharp criticism of the building industry for its lack of rationalization and its failure to adopt methods and policies necessary for a long-term program of material conservation.

The report pointed out that this industry was one of the largest consumers of materials in the nation. In 1950 it used one-third of the copper, one-sixth of the iron and steel, one-fifth of the lead and zinc and two-thirds of the lumber. Heating and air conditioning used nearly one-fourth of the total fuel consumed. By 1970 the construction volume (excluding roads, dams and docks) was expected to increase 35% above 1950 levels, with a corresponding increase in material consumption unless use patterns were altered. The report stated, however, "although some firms and individuals in the many different elements of the building industry have made important contributions to improved use of materials a large part of the industry resists change. It is saddled with a multitude of restrictions, some of them self-imposed, which seriously impede desirable change."

Barriers to more efficient use of materials were attributed to four principal causes: the organization of the industry, prevalence of restraints of trade, rigidity of building codes and the inadequacy of research. The report pointed out that the industry was comprised of a large aggregation of many types of enterprises, of which a large proportion were small. Organizational efficiencies cannot be secured by small firms, and, moreover, these are more vulnerable to economic fluctuations and more subject to control by financial institutions. Restraints of trade had continued despite the fact that one-fourth of all antitrust cases had involved the building industry. These restraints included the withholding of materials, banning of new methods, price agreements, complicity among contractors submitting bids, and various types of licensing arrangements. Building codes, whose purpose is public protection, because of diverse requirements and archaic specifications, had militated against standardization in building materials production and had made for wasteful use of building products. Research in building materials had been limited for the most part to improving and developing particular products, but because of the fragmentary nature of the industry, little had been done in the basic study of the elements and components of structures.

Based upon its study, the commission made a number of important recommendations. To combat practices in restraint of trade it suggested that the department of justice and the Federal Trade commission intensify their efforts and also study the adequacy of existing legislation. To assist in rectifying the difficult building code situation, the commission urged the federal government to formulate a standard building code based on structural performance rather than on stipulation of specific materials. It further recommended that except for monuments, etc., federal construction should not be permitted to use materials in excess of the minimum required by the national standards. Further implementation might be given to this program by making such standards become the "minimum construction requirements" of the FHA for issuance of mortgage insurance and

MODEL OF THE BUILDING and traffic project under way in the heart of Caracas, Venez., in 1952. The new downtown centre was to include 24 buildings and four traffic levels, and was to form the nucleus of a total revamping of the city

by preventing the FHA from underwriting loans on houses in areas that had "building codes and zoning laws which do not permit use of alternative materials permitted by the national standard." The commission felt, however, that the federal government should not make any attempt to prohibit private or local construction that used materials or standards in excess of minimum construction requirements.

Conservation in Building Construction.—At midyear the Building Research Advisory board released a report on conservation of building materials. The initial purpose of this study was to survey methods used in federal building construction so that uses of critical materials could be limited as much as possible to leave an adequate supply for nonfederal building. As the survey proceeded during late 1951 and early 1952, material supplies became more ample and it was not necessary to devote exclusive attention to the emergency situation. While the report made many recommendations useful in times of critical shortages, others applied to long-range peace-time operations. These recommendations emphasized frugal design to eliminate wasteful use of materials, conserve real resources and reduce dollar costs.

Urban Redevelopment Programs.—In 1952 Philadelphia, Pa., became the first city in the United States to complete a redevelopment project under provisions of Title I of the Housing act of 1949. Penn Towne in the East Poplar section of Philadelphia consisted of 138 new and 36 rehabilitated apartment units, an attractive and efficient blending of old and new structures in an area that a short time before was ugly and decayed.

By the end of Aug. 1952, 249 localities of various size and character were approved for reservation of capital grant funds and were participating in the Title I program. Many others were undertaking similar programs with state and local financing. A total of 96 federally aided projects in 65 communities were approved for final planning or development, compared with 40

in 21 localities at the end of Aug. 1951.

Under the provisions of Title I, capital grants aggregating \$500,000,000 were made available to localities for the purpose of defraying up to two-thirds of the difference between cost of assembling and clearing slums and blighted areas and the fair value of the sites for approved new uses. An additional \$1,000,000,000 in loans could be used for planning, acquisition and clearance—as well as for financing land that was leased rather than sold. An act of congress approved June 3, 1952, facilitated redevelopment by making possible advance or progress payments on capital grants to local public agencies. Previously such payments could not be made until each phase of the project had been completed and all items of cost finally determined.

In St. Paul, Minn., slums flanking the state capitol were being removed and the building put into a new, appropriate setting. Co-operative housing in New York city was soon to replace one of the last pockets of decay on Lower Manhattan's East river front. Three Chicago projects undertaken by the Land Clearance commission each provided a different purpose: one was to consist of an entirely new neighbourhood replacing 20 blighted blocks; the second would restore an unused subdivision for single-family homes; and the third would provide industrial sites within one mile of the loop. (See also ARCHITECTURE; BUSINESS REVIEW; CERAMIC PRODUCTS; HOUSING; TOWN AND REGIONAL PLANNING.) (CH. RA.)

Great Britain.—The return of a Conservative government to power toward the end of 1951 led to certain changes of policy in the building industry during 1952. There was some loosening of controls to encourage more building sponsored by private individuals as opposed to local authorities. At the same time, the shortage of certain materials, notably steel, combined with the absorption of labour by works in connection with the defense program resulted in a considerable slackening of progress in construction of schools and factories. A notable advance in the rate of completed dwellings was obtained, as promised by the Conservatives at the general election, but the volume of civil building as a whole declined somewhat. A good deal of interest was occasioned by the rise of self-build housing associations, groups of men having, in the main, no special knowledge of building, pooling their resources to purchase materials and setting out to build houses for themselves in their spare time.

On the side of technique, valuable progress was reported in the development of planning and construction of schools so that, in spite of the general rise in building costs, a drop of more than 25% in the cost per place in new primary and secondary schools was achieved between 1945 and 1952. Various techniques using precast concrete units showed considerable advancement since the early postwar period and particular interest was shown in the application of pretensioning devices to cables of reinforcing wires threaded through series of precast concrete units. It was felt by many that experiment along these lines offered the most promising development of constructional technique. For steelwork construction interest centred in suggestions put forward for a new basis of design known as the "collapse method." By this method, permissible loading of structures was determined not by the induced stresses calculated according to elastic theory but by taking account of the development of the plastic hinges which cause collapse of the structure and by allowing a definite load factor against the formation of these hinges. The method appeared to offer valuable opportunities for economy in the design of steel structures. (D. A. G. R.)

Bulgaria. A people's republic in the eastern part of the Balkan peninsula, Bulgaria is bounded north by Rumania, west by Yugoslavia, south by Greece and east by Turkey and

the Black sea. Area: 42,796 sq.mi. Pop.: (1946 census) 7,022,206; (1951 est.) 7,310,000. Language (1947 est.): Bulgarian 88%, Turkish 9.8%. Religion (1947 est.): Greek Orthodox 84%, Moslem 11.5% (of whom one-sixth Pomaks, or Moslem Bulgars, remainder Turks), Roman Catholic 0.9%, Gregorian Armenian 0.4%, Jewish 0.3%, Protestant 0.2%. Chief towns (pop., 1947 est.): Sofia (cap., 434,888); Plovdiv (125,440); Stalin, formerly Varna (77,792); Russe (53,420); Burgas (43,684). Chairman of the presidium of the national assembly in 1952: Gen. Georgi Damianov; prime minister: Vulko Chervenkov.

History.—The year 1952 was uneventful in Bulgaria, which of all the satellite states had gone furthest along the road of Stalinization, and was the most effectively concealed from the eyes of the outer world.

The number of collective farms was apparently not greatly increased. Emphasis was rather on consolidation. According to figures published by the State Planning commission in February at the beginning of the year 53% of all peasant holdings were in collective farms, and on these collective farms 55% of the work was mechanized.

The Communist party's main instrument in the countryside remained the Agrarian union, which belonged together with the Communist party in the Fatherland front. Communist control was no less complete in the other satellite states than in Bulgaria, but it operated in a somewhat different manner. In Bulgaria the Communists had found it convenient to exploit the traditional name of the Agrarian union for their purposes. This once great and popular political party was a subordinate body whose personnel and slogans were chosen by the Communists. Communist agents operated in the villages not under the name of the Communist party but under that of the Agrarian union. The congress of the Agrarian union, held Dec. 28-30, 1951, revealed clearly its real role. The leading figure in the union, Georgi Traikov, emphasized the union's duty to "render help to the Communist party and the Bulgarian government."

The Fatherland front had a similar but more general purpose. It was used by the Communists to attract support from wherever it could be found. Its third congress met at the end of May. At this congress its complete subordination to the Communist party was made clear in the speech delivered by Chervenkov. He stressed the front's obligation to mobilize the "broad nonparty masses" behind the Communist party's leadership. The last fiction of its separate identity was abandoned when Chervenkov stated that the front no longer had any need of a program of its own, distinct from that of the Communist party.

There were some ministerial changes. On May 1 Vladimir Poptomov, a vice-premier, a veteran Muscovite Communist of Macedonian extraction, died. On Aug. 20 Anton Yugov ceased to be minister of heavy industry and was appointed vice-premier. On Sept. 3 the minister of foreign trade, Dimitar Ganev, and the minister of agriculture, Nikola Stoilov, were relieved of their posts. The second of these changes might be connected with difficulties in the collectivization policy. It will be recalled that the previous minister of agriculture, Titko Chernokolev, was dismissed in disgrace in June 1951.

The State Planning commission claimed in February that during 1951 industrial production had increased by 16% in comparison with 1950. Cotton fabrics had increased by 13%, coal by 8%, electric power by 27% and machinery by 32%.

On May 12 the government introduced a currency reform. Like the Rumanian reform of January and the Polish reform of Oct. 1950, it tied the revalued currency to the soviet rouble, "the most stable currency in the world." Together with the reform came price reductions, mainly between 15% and 30%. All rationing was abolished. One new lev was to be exchanged for 100 old in cash. Various types of savings accounts obtained privileged

rates varying from 2 to 4 new for 100 old.

Labour shortage and labour turnover continued to engage the attention of the government. A central administration of labour reserves was created in March. It was to be responsible for two-year industrial schools, factory schools and a railway training school, to all of which boys aged 14-17 would be eligible. The whole organization was based on the institution of similar name that had existed since 1940 in the Soviet Union. Unlike its soviet prototype, however, the Bulgarian institution did not yet seem to have been given power to mobilize children.

The hate campaign against Bulgaria's neighbours continued throughout the year. Various notes of protest on alleged frontier violations were addressed to Yugoslavia, Greece and Turkey.

An investigation by the ministry of state control into state bakeries revealed in January that 90% of the bread samples examined were below the official standard. Todor Yurdanov, assistant minister of internal trade, was severely reprimanded and several officials of the ministry were dismissed.

An article of Jan. 31 in the Communist party daily *Rabotnichesko Delo* expressed official dissatisfaction with the content of Bulgarian children's books, which did not pay sufficient attention to contemporary subjects. "The brotherly friendship with the Soviet Union, vigilance and the unmasking of the repulsive Titoite traitors are themes still waiting to be incorporated in our children's literature."

(H. S-W.)

Education.—Schools (1949-50): kindergarten 1,403, pupils 57,487, teachers 2,124; elementary 6,112, pupils 755,628, teachers 18,801; higher elementary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; technical 101, pupils 26,800, teachers 943; institutions of higher education (1951-52) 13, students approx. 40,000, professors and lecturers 2,084. Illiteracy (1952): 6%.

Finance.—Monetary unit: lev (pl. leva) revalued on May 12, 1952, with an exchange rate of 1.70 leva=1.00 rouble compared with the previous exchange rate of 71.42 leva=1.00 rouble. The old lev was valued in Nov. 1951 at 290 leva to the U.S. dollar. Budget (1951 est.) revenue 271,794,000,000 old leva, expenditure 267,922,000,000 old leva; (1952 est.) revenue 370,146,000,000 old leva, expenditure 343,946,000,000 old leva.

Foreign Trade.—(1950) Imports U.S. \$178,000,000; exports U.S. \$133,000,000. Main sources of imports (1950): U.S.S.R. 67.4%; Czechoslovakia, Hungary, Poland and Rumania 24.1%. Main destinations of exports: U.S.S.R. 45.1%; four other eastern European countries 30.8%.

Transport and Communications.—Roads (1949): 13,870 mi. Licensed motor vehicles (Dec. 1950): cars 6,000, commercial 5,000. Railways (1952 est.): 2,231 mi. Telephones (1950 est.): 57,000. Radio receiving sets (1949): 205,000.

Agriculture.—Main crops (metric tons, 1948): wheat 1,503,000; maize 890,000; barley 249,000; rye 170,000; oats 105,000; potatoes (1934-38 average) 109,000; tobacco 20,000. Sugar production, raw value: 46,000. Wine production: (1938) 2,373,000 hl., (1949) 426,000 hl. Livestock: sheep (1948) 8,784,000; cattle (1950) 2,140,000; pigs (1950) approx. 1,500,000; horses (1948) 549,000; asses (1948) 157,000. Wool production, greasy basis (1951) 12,000 metric tons.

Industry.—Fuel and power: coal (1952 est.) 400,000 metric tons; lignite (1951 est.) 4,500,000 metric tons; electricity (1950) 900,000,000 kw.hr. In Nov. 1951 the Stalin Chemical combine began production with a planned yearly output of 70,000 metric tons of nitrogen fertilizers. Textile production (1952 est.): woollen fabrics 8,100,000 m.; cotton fabrics 95,000,000 m.

Burma.

An independent federal republic, Burma lies on the eastern side of the Bay of Bengal, between Pakistan and India on the northwest, Tibet on the north and China, Indochina and Thailand (Siam) on the east. Area: 261,749 sq.mi. Pop.: (1941 census) 16,823,798; (1951 est.) 18,674,000. Racially, the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. Largest indigenous minorities (1931): Karens 1,367,673, of whom 218,790 were Christians; Shans 1,057,406; Chin-Kachin group c. 750,000. Largest immigrant minorities: Indian (1931) 1,017,825 divided equally between Moslems and Hindus; Chinese (1941) c. 380,000. Chief towns (pop., 1941 census): Rangoon (capital and main port, 500,800); Mandalay (163,537); Moulmein (71,181); Bassein (c. 50,000); Akyab (pop. 1931, 38,094). Presidents of the republic in 1952: Sao Shwe Thaik and (from March

12) Ba U; prime minister, U Nu.

History.—The first parliament elected under the constitution adopted in March 1947 met in March 1952, in place of the original constituent assembly which, because of the disturbed condition of the country, had carried on as a provisional legislature for nearly five years. It was significant of the situation that the new chamber of deputies was short of members from 24 constituencies where voting was still not possible. The chamber's first task was the election of a president of the Union of Burma, and on March 12 in joint session they chose Ba U, formerly chief justice; the outgoing president, Sao Shwe Thaik, was elected speaker of the upper house. On March 14 a reshuffle of the ministry was approved by the chamber of deputies, U Nu remaining premier, and the cabinet in general was still dominated by the Socialist party. The position of the ministry in the chamber of deputies was assured, as they could count on the support of about 180 members out of 233.

The budget was presented on Aug. 18. The revenue estimates for the year 1952-53, commencing on Oct. 1, showed estimated receipts of 699,434,000 kyats (about \$147,000,000) and estimated expenditure of 654,897,000 kyats (about \$137,760,000), but the capital account estimates provided for receipts of 135,522,000 kyats (\$28,560,000) and expenditure of 476,396,000 kyats (\$98,560,000). Other nonrevenue transactions were estimated to give a surplus of 52,600,000 kyats (\$10,920,000), so that the over-all situation showed a prospective deficit of 243,800,000 kyats (\$51,240,000). The budget speech stressed the importance attached by the government to welfare and capital expenditure, but necessarily defense remained by far the largest item of expenditure, absorbing about \$84,000,000. No important changes in taxation were proposed, and, as in previous years, no provision was made for repayment of the debts due to Great Britain and India.

A number of development plans were announced during the year. A U.S. firm which had been employed to examine and report on possible developments of natural resources reported early in the year, making recommendations in respect of fiscal and monetary policy, mining, industry, transportation, water resources, power supply, agriculture and forestry, and the government appointed a committee to study the report. The receipt of U.S. aid continued; in the two years after June 1950 aid to the extent of about \$10,000,000 reached Burma in the form of goods and services. The acceptance of such aid was criticized by the opposition as liable to prejudice Burma's neutral position in world affairs, but speaking in July the premier affirmed that the policy of neutrality would continue and that his government was prepared to accept aid from any quarter that would give it, provided that no political conditions were attached.

The Communist and other rebellions continued throughout the year, but the government's forces made steady, if slow, progress against the insurgents. In central Burma the Communists were subjected to steady pressure and in May their main headquarters were overrun. The effect of these operations was seen in an effort by the Communists to seek an accord with the government, but the latter would accept nothing less than complete surrender. In Lower Burma the area of the Irrawaddy delta held by the Karen National Defense organization was reduced, though because of the difficulties of the terrain the Karen rebels in the hills of eastern Burma remained almost unmolested; the Karens were able also to carry out a good deal of sabotage of communications, including the severance on several occasions of the pipe line supplying Rangoon with water. In northern Arakan the Moslem rebels, seeking a separate Moslem state or, perhaps, accession to Pakistan, also remained in the field; this Moslem rebellion was small in dimensions, but more important military opera-

tions elsewhere prevented any major action against it.

An effort to conciliate the Karen rebels was made in the establishment by law of a Karen state, autonomous for purposes of local government, in the eastern hills of Lower Burma. The territory allotted to the state comprised the Salween district, and the adjoining townships of Thandaung, Hlaingbwe, Pa-an, Kawkaik and Kya-in Seikkyi. A conciliatory disposition was also indicated by the government in the appointment to the cabinet, as minister for the Karen state, of Mrs. Ba Maung Chain, daughter of the well-known Karen leader, Sir San C. Po. Mrs. Ba Maung Chain toured the Irrawaddy delta, trying to persuade the Karens to lay down their arms, but with little success. The defect of the new Karen state was that the territory granted to it consisted mainly of unproductive hills, while the great majority of Karens lived in the fertile lowlands around Moulmein and in the Irrawaddy delta; and the value of the formation of the state as a conciliatory gesture was further reduced by the fact that the area allotted it was already in the hands of the rebels.

A further cause of disorder was the continued presence in the Shan states of a body of Chinese nationalist troops which sought to use Burma as a base for attacks on Yunnan. This force remained quiescent throughout the year and made no advance against Communist China, but its presence was a clear breach of Burmese sovereignty and was a considerable nuisance to the local inhabitants who were forced to supply food. Efforts by Burmese government forces to dislodge the Chinese were not successful, but, as with the Moslem rebellion in Arakan, the problem was a minor one, affecting only the fringe of the country, and therefore took a secondary place in comparison with the Karen and Communist rebellions.

Among minor developments during the year were the adoption, as from April 1, of the use of Burmese instead of English as the official language of courts and offices, and the adoption of a decimal system of coinage in which the rupee was replaced by the kyat, of the same value, and the kyat was divided into 100 pya instead of 16 annas.

(B. R. P.)

Education.—Schools (1948): primary 4,795, pupils 431,684, teachers 11,315; postprimary 142, pupils 11,648, teachers 722. Teachers' training college 1, with over 200 trainees. Universities (1950) 2, students 3,350 (incl. 780 women).

Finance.—The monetary unit is the kyat, with an exchange rate (1952) of 4.778 kyats to the U.S. dollar.

Foreign Trade.—(1951): Imports 681,000,000 kyats, exports 981,000,000 kyats. Main sources of imports (1951): India 37%; U.K. 16%; Japan 18%; Malaya 6%. Main destinations of exports: Ceylon 24%; India 23%; Japan 13%; Indonesia 13%. Main imports (1951): cotton piece goods 30%; bags and sacks 7%; machinery and vehicles 6%. Main exports: rice 77%; teakwood 5%; cotton, raw, 3%.

Transport and Communications.—Roads (1949) 12,472 mi. Licensed motor vehicles (Dec. 1950): cars 5,100; commercial 24,000. Railways (1950): 1,777 mi.; passenger-miles 80,000,000; net freight ton-miles 93,000,000.

Agriculture.—Main crops (metric tons, 1951): rice 5,900,000; peanuts 180,000; cottonseed 19,000; sesame seed 49,900; cotton, ginned (1950-51), 6,000; dry beans 109,000. Livestock (Jan. 1950): cattle 4,488,000; sheep 21,000; goats 172,000; pigs 402,000; buffaloes 721,000. Fisheries: total catch est. 500,000 tons annually.

Industry.—Factories (1947) 473; persons employed 46,480. Raw materials (metric tons, 1951): tin concentrates 960; natural rubber, net exports, 13,200; lead (1948) 7,500; silver (fine oz., 1948) 480,000; timber, teak (1948-49 rafting season) 68,938 logs.

Buses: see **AUTOMOBILE INDUSTRY; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION.**

Business Review. The year 1952 was characterized in the United States by a gradual and orderly expansion of the economy from the record high levels reached in the last half of 1951, in a setting of general over-all stability. The basic economic forces underlying the high level of business activity in 1952 were continued large business outlays for plant and equipment, the stepping-up of government defense expenditures, the record high level of employment and the un-

precedented volume of spendable personal income.

The major readjustments incident to superimposing a defense economy upon an already high-level peacetime economy following the outbreak of war in Korea in mid-1950 were largely completed during the last half of 1951. Throughout the year 1952, except for the midsummer disruptions occasioned by the 53-day steel strike (June 2-July 25), there was a gradual build-up in the pace of economic activity on a wide economic front. The extent of the expanded activity is roughly measured by the increase in the gross national product which, as reported by the department of commerce, reached an annual rate of \$344,000,000,000 in the third quarter of the year, a gain of \$4,600,000,000 from the first quarter and of \$6,900,000,000 from the third quarter in 1951. The two major factors in the increase in the gross national product were the increase in government defense expenditures and increases in personal consumption expenditures.

The inflationary pressures which converged upon the economy in mid-1950 with the outbreak of war in Korea, though unspent and still present, were largely under control by mid-1951 so that the stepping-up of government purchases for national security throughout 1952 was accomplished without accentuating inflationary trends as measured by prices to any marked degree. A rising volume of production also acted as a brake on inflation.

The Defense Production Act of 1950 which was due to expire June 30, 1952, was amended and extended by act of congress approved June 30, 1952 (public law 429, 82nd congress), effective July 1, 1952. This act extended the major economic controls to the middle of 1953 with modifications mainly in the direction of liberalizing price and credit control provisions, reflecting the easing of inflationary pressures as indicated by wholesale and retail price trends and manufacturers' inventories. The amendments to the Defense Production act of 1952 discontinued authority for regulation of consumer instalment credit

PRE-CHRISTMAS shopping crowds in midtown Chicago, Ill., late in 1952. Christmas sales in department stores across the nation were generally higher than for 1951 except in New York city where sales dropped

OVERHEAD CONVEYORS for eliminating the handling of meat being transferred from refrigerator cars to storage in a warehouse opened by the Great Atlantic & Pacific Tea Co. at Toledo, O., in 1952

(regulation W), and for the volunteer credit restraint program. Authority to control real estate construction credit was continued, but residential credit was made contingent upon the rate at which new houses were started. The effect of these amendments was to withdraw two supplementary instruments of selective credit restraint and to limit the flexibility with which the third could be administered in the event of a resurgence of inflationary pressure.

National Product and Income.—The gross national product as reported by the department of commerce reached an annual rate of \$339,400,000,000 during the first quarter of 1952—an all-time high as of that date and an annual rate \$2,300,000,000 above the rate in the fourth quarter of 1951. During the second quarter the annual rate was stepped up by \$3,800,000,000 to \$343,200,000,000. The Council of Economic Advisers estimated the gross national product for the third quarter at an annual rate of \$344,000,000,000, or an annual rate \$13,100,000,000 above the third quarter of 1951 and \$4,600,000,000 above the first quarter of 1952. The third quarter increase from the first quarter of the year was caused by increases in government purchases of goods and services for national defense and in personal consumption expenditures, the former increasing during the period by \$3,600,000,000 and the latter by \$2,800,000,000. Net foreign investment declined by \$1,900,000,000 during the period, and there was no expansion in the rate of government expenditures other than for national security, nor in the rate of private domestic investment which was at an annual rate of \$50,000,000,000 in the third quarter, somewhat lower than the rate which prevailed throughout 1951.

National income or purchasing power distributed through the economy also reached a new all-time high in 1952. For the first quarter of the year the national income as reported by the department of commerce was at an annual rate of \$288,000,000,000 or \$2,400,000,000 above the fourth quarter of 1951. There was little change from the first quarter in the annual rate during the second and third quarters of the year—the rate was slightly down in the second quarter and slightly up the third quarter, but the third-quarter annual rate of \$288,200,000,000 was \$8,000,000,000 above the third quarter of 1951. The increase from the third quarter of 1951 was primarily the result of an increase in the compensation of employees which, at annual rates, was \$7,200,000,000 greater than in the third quarter of 1951.

Proprietors' income, rental income and interest income were also above the third quarter of 1951. Corporate profits before taxes and after inventory valuation adjustment were below the third quarter of 1951, but the average annual rate for the first three quarters of 1952 was \$41,700,000,000, substantially the same as in 1951 and \$6,900,000,000 above 1950. (See also INCOME AND PRODUCT, U.S.)

Prices.—Throughout 1951 retail prices were relatively stable at the new high level with a rising trend during the fourth quarter, while wholesale prices after March 1951 declined steadily. During the first half of 1952 wholesale prices continued to decline, and after a slight upturn in July and August resumed the downward trend in September. In June 1951 the department of labour's index of wholesale prices stood at 111.2% of the 1947-49 average, a decline of 1.6% from January and of 3.3% from June 1951. Retail prices, on the other hand, after a slight drop in Feb. 1952, primarily because of a fairly sharp drop in food prices, continued to rise slowly and by the middle of July had reached a new high peak slightly above the January level.

The increase in the all-items consumers' price index of the department of labour was largely the result of increases in the food and rent items in the index; apparel and house furnishings items trended slowly downward after the last quarter of 1951. The sustained high level of retail prices throughout the year suggests that expanding demand continued to press on the supply of commodities available to meet both civilian and defense requirements. (See also PRICES.)

Employment.—Employment in 1951 reached record high levels when the monthly average for the year, according to reports of the department of commerce, reached 61,005,000. During the first eight months of 1952 employment continued at the same high level with substantially the same pattern of seasonal fluctuations from month to month as in 1951. During the first quarter of 1952 employment was down seasonally from the fourth quarter of 1951, but was slightly above the corresponding quarter in 1951. During the second quarter employment increased steadily, reaching a peak for the first eight months of the year at 62,572,000 in June, which was 769,000 above the June 1951 peak. During the third quarter of the year employment declined from the June peak, but in each month of the July-September period the total number employed exceeded 62,000,000.

Nonagricultural employment was estimated at 54,712,000 in September, an increase of 658,000 over Sept. 1951. Agricultural

employment in September was 7,548,000, substantially the same as in Sept. 1951.

The number of persons in the civilian labour force increased during the year with the peak coming in the June-July period, when the number of persons available for work was slightly more than 64,000,000. In September the labour force dropped to 63,698,000, of which 62,260,000 were employed. The number unemployed in September represented only 2.3% of the civilian labour force, the lowest proportion at any time since 1944. (See also EMPLOYMENT.)

Wages and Hours.—During the first eight months of the year average hourly earnings of production and related workers in manufacturing were fairly constant, fluctuating between \$1.64 and \$1.66 as reported by the department of labour. The monthly average for 1950 was \$1.47, and for 1951, \$1.59. Retail price increases from 1951 somewhat reduced the purchasing power of wages. In terms of 1951 prices, average hourly earnings for the first eight months of the year fluctuated between \$1.61 and \$1.64. The highest hourly rates were paid in building construction, ranging from \$2.26 to \$2.29; the lowest, in retail trade, ranging from \$1.28 to \$1.32. Average hourly earnings in the durable goods industries were slightly higher than in the non-durable goods industries, the former ranging from \$1.72 to \$1.76 during the first eight months of the year; the latter, from \$1.52 to \$1.55.

Average hours worked per week in manufacturing industries remained fairly constant at about 40 hours, dropping slightly lower in April and July. Hours worked per week were slightly longer in the durable goods industries than in the nondurable goods industries, ranging in the former from 40.3 to 41.8 and in the latter from 38.4 to 39.8. In building construction average weekly hours ranged from 36.9 to 38.7.

Average weekly earnings of production and related workers in manufacturing during the first eight months of the year ranged from \$65.80 to \$66.91. For the same period, average weekly earnings in durable goods manufacturing ranged from \$69.88 to \$72.81; in nondurable goods manufacturing, from \$58.71 to \$61.45; in building construction, from \$84.57 to \$88.31; in retail trade, from \$50.90 to \$53.25. Average weekly earnings of production and related workers in manufacturing in Aug. 1952 at \$66.85 were \$2.53 above Aug. 1951, but in terms of 1951 prices the increase was reduced to 53 cents. (See also WAGES AND HOURS.)

Personal Income, Spending and Savings.—Total personal income in Jan. 1952 was at the annual rate of \$263,400,000,000 and by August had risen to a new high annual rate of \$267,100,000,000, a gain of \$3,700,000,000 from Jan. 1952 and of \$10,400,000,000 from Aug. 1951, according to reports of the department of commerce. Disposable personal income, that is, income after taxes, was at an annual rate of \$230,500,000,000 in the first quarter of the year, an annual rate \$12,500,000,000 above the first quarter of 1951. In the third quarter of 1952 disposable personal income rose to an annual rate of \$233,000,000,000, an increase of \$2,500,000,000 from the first quarter of the year.

Personal consumption expenditures during the first quarter of 1952, at an annual rate of \$213,200,000,000, were higher than for any quarter in 1951 when the second wave of scare buying was touched off by the entrance of the Chinese Communists into the Korean war, continued to increase during the second quarter and reached an annual rate of \$216,000,000,000 in the fourth quarter.

During the first three quarters of the year the rate of increase in personal consumption expenditures paralleled the rate of increase in disposable personal income, so that the annual rate of personal net savings remained fairly constant from quarter to quarter at around \$17,000,000,000, or a little more

than 7% of disposable personal income.

Production.—Industrial production for the year 1952 continued at the high level reached in 1951, although there were some shifts and temporary interruptions. During the first quarter of the year total industrial production, as measured by the federal reserve board's index, expanded from the final quarter of 1951. The index in February rose to 222% of the 1935-39 average, higher than for any month in the last half of 1951. Beginning with March there was a gradual decline through May followed by a sharp drop in June and July, because of the prolonged steel strike which affected production in the durable goods industries on a broad front. In August, with the steel strike ended, production expanded rapidly, and in September the index rose to 223% of the 1935-39 average, the previous postwar peak, and the highest point for the previous 18-month period.

The index of manufacturers' durable goods continued to rise during the first three months of the year, reaching the high point of 284% of the 1935-39 average in February and March. The index eased to 277% in April and May, and dropped precipitately in June and July, falling to the low point of 231% in July, a decline of 53 percentage points from the high point in March. The trend in the production of nondurable goods for this period paralleled that of durable goods, except that the downturn started a month earlier, in February, and the effect of the steel strike was less pronounced. The production of both durable and nondurable goods expanded rapidly in August and September, the index of durable goods rebounding to 283% in September, only slightly below the year's high in February and March, and the index of nondurable goods rising to 192%, the highest for the year.

New Plant and Equipment.—The increase in business expenditures for new plant and equipment which began in the second quarter of 1950 was accelerated after the outbreak of the Korean war in mid-1950. During the year 1951 the annual rate of such expenditures was stepped up quarter by quarter and in the fourth quarter, according to estimates of the department of commerce, reached an annual rate of \$27,300,000,000, an increase in the annual rate of \$6,700,000,000 from the annual rate in 1950.

Throughout the year 1952 business expenditures for plant and equipment were at an annual rate slightly above that reached in the last quarter of 1951, and were estimated for the fourth quarter of 1952 at an annual rate of \$27,900,000,000.

Expenditures for new plant and equipment in manufacturing constituted 43.8% of the total in the first quarter of 1952 and rose to 47.3% of the total in the fourth quarter. In the fourth quarter, manufacturers' expenditures for plant and equipment were estimated by the department of commerce to be at an annual rate of \$13,320,000,000, or a rate about \$1,280,000,000 above the rate in the first quarter of the year. Public utilities' expenditures for new plant and equipment, also, were at a higher level through 1952 than in 1951, and in the fourth quarter of the year were estimated at an annual rate of \$4,200,000,000. Expenditures for new plant and equipment by commercial and other types of businesses continued at a high level throughout 1952 but were slightly below the high level of 1951, with a slightly downward trend throughout the year. The annual rate of expenditures during the fourth quarter was estimated at \$6,790,000,000 by the department of commerce, a drop of \$48,000,000 from the annual rate of the first quarter.

Inventories and Sales.—Total business inventories declined slowly but constantly throughout the first eight months of the year, but remained near the high level of the last half of 1951. According to department of commerce estimates, total inventories at the beginning of the year stood at \$70,219,000,000 and

at the end of an eight-month downward trend stood at \$69,481,000,000 in August. Retail inventories for the January-August period trended slightly downward while manufacturers' inventories climbed slowly. In the over-all picture, the decline in retail inventories as personal consumption expenditures increased tended to offset the increase in manufacturing inventories. The high level of manufacturers' inventories and the gradual increase in volume after the middle of 1951, combined with a fairly constant trend in manufacturers' sales, was reflected in the easing of wholesale prices after mid-1951. In like manner, the gradual drop in retail inventories during the same period, combined with sustained and rising retail sales, was reflected in the upward trend in the retail price level. The spread between department store inventories and sales during the first eight months of the year, except for the two short-lived periods of scare buying incident to the Korean war, was less than at any period since the first quarter of 1950.

Construction and Real Estate Activity.—Construction and real estate activity continued at high levels in 1952, and the physical volume of new construction was at a record level according to reports of the board of governors of the federal reserve system. The dollar volume of new construction in each of the first nine months of 1952 was substantially above the 1951 monthly average of \$2,585,000,000 according to reports of the department of commerce.

The record high of \$2,854,000,000 was reached in March, and the monthly total for each of the months in the third quarter was well over \$2,600,000,000. Private construction—residential, nonfarm construction and business construction—accounted for roughly two-thirds of the total, and federal, state and local government construction for about one-third of the total. Of the \$2,676,000,000 total in Sept. 1952, \$1,802,000,000 was for private construction and \$873,000,000 was for federal, state and local government construction including public residential construction. From March 1952 through August, with the single exception of the month of June, the number of new houses started was well above the number for the corresponding month in 1951, although substantially below the corresponding months of 1950, the peak postwar year for residential building. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

Consumer Credit.—Reflecting the waning inflationary pressures as goods became more abundant, the federal reserve board, on May 7, suspended the regulation on instalment credit (regulation W). A few days earlier, the board had suspended the voluntary credit restraint program. The Defense Production Act Amendments of 1952, passed June 30, 1952, and effective July 1, among other things, discontinued authority for the regulation of consumer credit and for the voluntary credit restraint program. During the period of credit restriction, consumer instalment credit remained fairly constant, around \$13,000,000,000. With the removal of restrictions, instalment credit increased rapidly and by August had reached \$14,907,000,000, an increase of \$1,851,000,000 from the low point for the year in March. The total amount of consumer credit outstanding in August was estimated by the federal reserve board at \$21,393,000,000, an increase of \$2,131,000,000 from August 1951 and of \$2,828,000,000 from the low point in March 1952. (See also CONSUMER CREDIT; FEDERAL RESERVE SYSTEM.)

Business Profits.—Corporate profits before taxes reached their all-time high at \$50,100,000,000 in the first quarter of 1951, declined during the second and third quarters and reversed the trend in the fourth quarter when they amounted to \$39,500,000,000. In 1952 profits before taxes expanded to \$42,700,000,000 in the first quarter and dropped to \$40,000,000,000 in the second and third quarters according to estimates of the department of commerce. Under the provisions of the 1950 tax

SHIPWAY at the Deutsche Werft, largest shipyard in Hamburg, Ger., where almost every month saw a new ocean-going ship completed in 1952. The revival of industry in Hamburg dated from the lifting of all Allied restrictions, in 1951, on building for Germany's own merchant marine

bill which became fully effective during the first quarter of 1951, the tax liability was raised to an over-all rate of around 55% of profits before taxes. During the first two quarters of 1952 corporate profits after taxes were lower than in the corresponding quarters of 1951, but in the third quarter, at an annual rate of \$17,000,000,000, they were substantially the same as in the third quarter of 1951. Although profits after taxes during the second and third quarters were at an annual rate \$1,100,000,000 below the first quarter of the year, dividend payments were slightly higher than in the corresponding

quarters of 1951 and undistributed profits were correspondingly lower. In the third quarter of 1952 dividend payments were at an annual rate of \$9,500,000,000 and undistributed profits at an annual rate of \$7,500,000,000.

Gross Private Domestic Investment.—Total gross private domestic investment during the first three quarters of the year was at an annual rate of about \$50,000,000,000, according to the department of commerce. Of the total, slightly more than \$23,000,000,000 was in new construction and about \$25,000,000,000 was in producers' durable equipment. Of the total investment in new construction about one-half, or \$11,000,000,000, was in residential nonfarm construction. The investment in business inventories declined drastically in the first three quarters of the year compared with the same period in 1951. During the first three quarters of 1951 investment in business inventories ranged from an annual rate of \$8,900,000,000 in the third quarter to \$16,300,000,000 in the second quarter. In 1952, the range during the first three quarters was from an annual rate of only \$100,000,000 in the second quarter to \$2,000,000,000 in the third quarter. (V. B. B.)

Other Countries.—Conditions in 1952 were governed largely by a return to a more normal state after the Korean disturbance and by a new stringency caused by rearmament. The year opened with the prices of raw materials generally falling, and this movement continued fairly widely up to midyear. By this time a number of materials—jute, manilla hemp, sisal, flax, wool, lead, rubber and zinc—had returned to about the pre-Korean level. It seemed doubtful whether prices would continue to fall, indi-

cating the approach of a slump, or whether they would become steady, suggesting that the disturbance caused by the Korean war was only an interruption in a long-term improvement. Wool steadied at its level of June 1950, but the other fibres continued weak. Lead and rubber steadied at the pre-Korean level, and tin rather higher, but zinc declined further. Copper had a divergent trend and tended steadily higher, a development probably connected equally with the claims of rearmament and with the uninterrupted progress of the electrical industries.

These trends reflected general uncertainties. On the one hand the panic buying of mid-1950 was being corrected. The world turnover in trade seemed to be diminishing. Tramp shipping freight rates (which had reached a peak in Oct. 1951) fell, by July had reached the level of Sept. 1950 and were still falling. For the third quarter of the year the International Materials conference increased its allocation of a substantial range of materials, including copper and nickel. On the other hand industry—in the United States, Great Britain, in western Germany and in France for instance—was at a very high or a rising level. Moreover, the fall in world prices was in a sense artificial; partly, at least, it was brought about by the dearer money policy adopted in such important industrial countries as the U.S., Great Britain, the German Federal Republic, France, Canada and Sweden. It was significant that capital development was increasing in a number of important countries while expenditure on consumption goods was falling, or at least lagging. This was an unstable position which would clearly end either in stagnation in the capital goods indus-

PART OF THE STRING section of the symphony orchestra made up of employees of the Bell Telephone system in the New York-New Jersey area. The orchestra gave its fourth annual concert at Carnegie hall, New York city, in 1952

tries or in greater activity in the consumption goods industries. The activity in the capital goods industries, coupled with import restrictions such as those imposed by Great Britain and Australia, suggested that a period of economic nationalism might be approaching. In the relative position of the capital and the consumption goods industries rearmament evidently played an important part. The growing development of the capital goods sector under the impact of rearmament became increasingly important.

Most governments were anxious to steer a course between inflation and deflation, between boom and unemployment. The effects of the post-Korean slump had been intensified by the dear money policies widely adopted to combat inflation and to attack the problems of rearmament, but during 1952 some countries had to revert to cheaper money. Even so consumption was relatively low.

Business conditions in the German Federal Republic were affected by factors peculiar to that country and by others associated with the working of a fairly liberal economy. Under the first head came the absence of expenditure on armaments and the receipts of large supplies of coal from the United States; under the latter the existence of a considerable reserve of unemployed. The result was a flourishing but austere economy. Business in the consumer goods industries continued moderate, though in the second half of the year consumer buying tended to improve. The capital goods industries, on the other hand, continued to expand rapidly though there was a shortage of coke and the improvement in the output of coal and steel was sluggish. A large export surplus made it possible to import the raw materials needed and to prevent a holdup in industry. The credit needed for the development of capital investment was created by the sale of foreign currencies accruing to the banks through the export surplus. A proportion of the resulting purchasing power was used to bring about a substantial increase in savings.

In Italy business conditions showed the working of economic liberalism and also deflationism in an economy much weaker than western Germany's. The chronic kernel of unemployment grew; the large proportion of those who had never been em-

ployed and of black-coated workers being particularly ominous. Demand for consumption goods (with the exception of food) was low, and the textile industry in particular continued to suffer from the previous year's depression. The capital goods industries did relatively well. The output of the steel mills and of electric power was satisfactory, business there being helped by the arrival of the first armaments orders from the North Atlantic Treaty organization. Exports suffered from foreign import restrictions, notably those imposed by Great Britain, France and Australia. The dubious view taken of business prospects generally was reflected in the high yield—about 10%—of leading equities.

Conditions in Australia resembled in an exaggerated and therefore specially clear form world conditions generally. The slump in the price of wool led to a severe reduction in the national wool cheque; this had a strong deflationary effect, which was supported by government action. During the first half of the year imports were drastically restricted. Thus some stagnation in business was inevitable, but it was noted that people did not find it necessary to draw heavily on their savings. At Easter time conditions were uneven. In Victoria demand tended to improve, though at the wholesale rather than at the retail level. In New South Wales and in South Australia and Western Australia business was fairly satisfactory; in Queensland on the other hand trade was dull, but the recession was not sufficiently severe to affect food sales. In New Zealand business followed a similar but less strongly deflationary line.

In Sweden, which resembled Australia in being a large producer of raw materials with a considerable industry and a high standard of living, conditions were similar. The difficulties caused by heavy buying of consumer goods after the Korean crisis were reinforced by a heavy fall in the value of Swedish exports. During the first four months of 1952 the production of consumer goods fell by 6% on a seasonal basis, the fall being particularly pronounced for textiles and shoes and imperceptible for food. Exports suffered particularly from the drop in the price of timber and of wood pulp. These difficulties were partly offset by a boom (connected with overseas rearmament) in the production of pig iron. The engineering industry also did well and employment remained full. On the whole, therefore, the economies of Australia and Sweden, both primarily producers

of raw materials though with important industries, achieved reasonable stability.

The growing interest of western Germany in South America made itself felt, and it was reported that a large metallurgical plant was to be established by a German group in Minas Gerais, Braz. (See also BANKING; INTERNATIONAL TRADE; LAW; STOCKS AND BONDS; TARIFFS; TAXATION.) (W. H. JN.)

Byrd, Harry Flood (1887—), U.S. senator, was born on June 10 at Martinsburg, W.Va., an elder brother of Adm. Richard E. Byrd. Educated at the Shenandoah Valley academy, Winchester, Va., he began his career as a journalist on the *Winchester Star* (owned by his father), also becoming engaged in farming and fruit-growing. He was a member of the Virginia state senate (1915-25), chairman of the Democratic state committee (1922-25) and governor of Virginia (1926-30). On March 4, 1933, he was appointed U.S. senator to fill the unexpired term of Claude A. Swanson, who had been named Pres. Franklin D. Roosevelt's secretary of the navy. Byrd was elected for the full term 1935-41 and re-elected for the terms 1941-47, 1947-53 and 1953-59. From the first days of the New Deal he opposed almost all its proposed legislation except defense and war measures. He became one of the senate's most persistent advocates of economy in government.

Although Pres. Harry S. Truman in 1950 had complained of "too many Byrds" in congress, Byrd revealed on Jan. 9, 1951, that he had received a cordial letter from the president which was interpreted as a move to reconcile the southern Democrats. Throughout the rest of the year and in 1952, however, Byrd continued his attacks on the administration's domestic and foreign policy.

Byrd won re-election to the senate for his fifth term of office in the national elections of Nov. 4, 1952.

Cabinet Members. The following members of President Harry S. Truman's cabinet held office on Oct. 1, 1952:

Post	Name	State
Secretary of State	Dean G. Acheson	Maryland
Secretary of the Treasury	John W. Snyder	Missouri
Attorney General	James P. McGranery	Pennsylvania
Postmaster General	Jesse M. Donaldson	Illinois
Secretary of the Interior	Oscar L. Chapman	Colorado
Secretary of Agriculture	Charles F. Brannan	Colorado
Secretary of Commerce	Charles Sawyer	Ohio
Secretary of Labor	Maurice J. Tobin	Massachusetts
Secretary of Defense	Robert A. Lovett	New York

Great Britain.—The following is a list of cabinet members of Great Britain on Sept. 30, 1952:

Post	Name
Prime Minister and First Lord of the Treasury	Winston Leonard Spencer Churchill
Secretary of State for Foreign Affairs	Robert Anthony Eden
Lord President of the Council	Lord Woolton
Secretary of State for Commonwealth Relations	The Marquess of Salisbury
Lord Chancellor	Lord Simonds
Secretary of State for the Home Department and Minister for Welsh Affairs	Sir David Patrick Maxwell Fyfe
Chancellor of the Exchequer	Richard Austen Butler
Lord Privy Seal	Harry Frederick Comfort Crookshank
Minister of Defence	Earl Alexander of Tunis
Secretary of State for the Colonies	Oliver Lyttelton
Secretary of State for Scotland	James Gray Stuart
Secretary of State for the Co-ordination of Transport, Fuel and Power	Lord Leathers
Minister of Health	Iain A. Macleod
Minister of Labour and National Service	Sir Walter Turner Monckton
Minister of Housing and Local Government	Harold Macmillan

Post	Name
President of the Board of Trade	George Edward Peter Thorneycroft
Paymaster General	Lord Cherwell

Calendar of Events, 1952: see pages 1-16.

California. Known as the "Golden state" because of the importance of gold production in its history, California acquired statehood on Sept. 9, 1850. The most southerly Pacific coast state of the United States, California is ranked second nationally in both area and population. A total area of 158,693 sq.mi. includes a water area of 1,953 sq.mi. As of July 1, 1951, the U.S. bureau of the census estimated California's population at 11,024,000 (1950 census, 10,586,223). Chief cities (with 1951 population estimates and 1950 populations in parentheses) were: Los Angeles 2,000,171 (1,970,358); San Francisco 785,357 (775,357); Oakland 384,575 (384,575); San Diego 375,000 (334,387); Long Beach 250,767 (250,767); Fresno 147,094 (91,669); Sacramento (the state capital) 137,784 (137,572); Berkeley 113,000 (113,805); Pasadena 104,087 (104,577); Richmond 101,000 (99,545); Glendale 100,000 (95,702); San Jose 98,300 (95,280).

History.—During 1952 the state officers remained Earl Warren, governor; Goodwin J. Knight, lieutenant governor; Frank M. Jordan, secretary of state; Charles G. Johnson, treasurer; Thomas H. Kuchel, controller; Edmund G. ("Pat") Brown, attorney general; Roy E. Simpson, superintendent of public instruction.

Earthquakes punctuated the year, with two serious quakes and many minor disturbances reawakening California's realization of the unusual geologic nature of the state. Property destruction and loss of life accompanied quakes whose damage centres were at Tehachapi and Bakersfield.

Continued urban and suburban development was evident from the great volume of tract houses built and purchased in 1952.

California's critical water problem was alleviated by abundant rain and heavy snowfall during the winter of 1951-52, while artificial solution was implemented by the U.S. navy plan for construction of a second aqueduct for the water-deficient San Diego area. Elsewhere in the state excessive spring runoff of water, resulting from the incompleteness of two of the Central valley project's major storage reservoirs, caused early crop damage.

Education.—Average daily attendance for budgetary purposes for 1950-51 in elementary school districts was calculated at 1,271,200, in high school districts at 422,321 and in junior college districts at 90,106.

Social Insurance and Assistance, Public Welfare and Related Programs.

As of July 1952 there were 272,904 recipients of old-age security payments with average monthly aid being \$66.18 per person (July 1951, 274,271 at \$66.93 per recipient). The aid to the needy blind program made average payments of \$81.24 to 11,090 persons. An average of \$50.05 per child was given to 136,866 needy children, while general home relief was provided for 25,475 cases. For the month of Aug. 1952 the three state-administered social insurance programs compensated 82,817 unemployed or disabled claimants per week in the total amount of slightly less than \$8,000,000 for the month. Total expenditures for the state department of corrections for the year 1951-52 were estimated at \$13,652,528. The total population of California's correctional institutions for adults as of July 31, 1952, was 12,771, including 410 women. Inmates of youth authority institutions numbered 2,487 (as of Aug. 1952), of which 313 were in its two schools for girls, 296 in its three forestry camps for boys and 1,104 in its four schools for boys; the remainder were in other institutions or prisons.

Communications.—Final automobile registrations for 1950 were 4,076,484, while the total number of vehicles aggregated 5,043,368. Estimated total expenditures by the state division of highways for reconditioning, resurfacing and construction of highways for 1951-52 were estimated at \$133,888,594 including \$21,754,971 in federal-aid contributions (1950-51, \$131,978,471 including \$16,828,919 federal assistance). Figures for 1950 indicated 7,518 mi. of steam railways and 702 mi. of electric railroads within California. As of Jan. 1, 1951, the state had 530 airfields, including 169 commercial, 162 municipal, 43 military and 156 other airports. At the same time there were 3,984 mi. of federal airways. Telephone stations within the state numbered 3,820,000.

PASSENGERS leaving the westbound streamliner "City of San Francisco" which hit a snowdrift and stalled during a severe blizzard in Jan. 1952. Stranded passengers were reached by snow plows after being trapped for three days and nights less than 200 mi. from San Francisco, Calif.

Banking and Finance.—Total assets of the 117 state-licensed savings and loan associations operating in California (as of Dec. 31, 1951) were \$760,706,588. As of March 31, 1952, California had 119 banks, with total assets of \$14,864,975,000, which were members of the federal reserve system.

Estimated total state revenues for 1951-52 were \$1,058,200,960 (1950-51, \$994,042,745), while estimated total expenditures were \$1,103,333,000 (1950-51, \$1,006,339,000). The state's net bonded debt (outstanding Nov. 30, 1951) was \$389,986,609. Per capita income for 1951-52 was estimated at \$1,878, while state tax collections amounted to \$1,007,599,000 (1950-51, \$943,534,000).

Agriculture.—For the sixth successive year California's estimated gross cash farm income for 1951 exceeded \$2,000,000,000, being \$2,724,743,000 (1950, \$2,284,701,000). Returns from livestock and poultry products aggregated \$1,073,933,000 (1950, \$830,908,000), while crop returns yielded \$1,637,320,000 (1950, \$1,440,152,000). Government payments added \$13,490,000 (1950, \$13,641,000) to the state's farm income. Total value of truck crops for 1951 was \$368,267,000, of field crops \$884,688,000 and of fruit and nut crops \$492,335,000.

Manufacturing.—Employment in manufacturing industries rose to a total of 1,038,000 wage and salary workers as of Aug. 1952, thereby exceeding the 1,000,000-mark for the first time since World War II. At the midway point total civilian employment in California was 4,879,000, while unemployment figures indicated 171,000 not working. Preliminary estimates of 1951 retail sales indicated \$13,200,000,000 or an increase of 5% in value over the previous year's volume. Public and private construction figures were estimated at 13% above the 1950 figure, or \$3,370,000,000.

Table I.—Leading Agricultural Products of California

Crop	Indicated 1952	1951	Average, 1941-50
Cotton, bales	1,900,000	1,765,000	627,000

Zinc	8,000	2,144,000	7,000	1,788,000
Other minerals	30,515,000	...	19,133,000
Total		\$1,056,047,000		\$1,075,612,000

*Values for processed materials are not included in the totals.
†Value included with other minerals.

750 were engaged in production of nondurable goods while 528,650 were employed in manufacture of durable goods. (D. C. Cr.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in California in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. California ranks first among the states in the production of borates, diatomite, sand and gravel and tungsten; second in cement, petroleum and potash; and third in gold and natural gas. The state stands third in the value of output, with 8.91% of the U.S. total.

Cameroons: see BRITISH WEST AFRICA; TRUST TERRITORIES.

Cameroon: see FRENCH EQUATORIAL AFRICA; FRENCH UNION.

Camp Fire Girls: see SOCIETIES AND ASSOCIATIONS, U.S.

Canada. A member of the Commonwealth of Nations, Canada is a federal union covering all of North America north of the United States except Alaska. Provinces: Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, British Columbia, Prince Edward Island, Alberta, Saskatchewan, Newfoundland. Outside the provincial boundaries are the Yukon and the Northwest Territories, under federal jurisdiction.

Area: 3,843,144 sq.mi.; capital: Ottawa (*q.v.*); largest English city: Toronto (*q.v.*); largest French city: Montreal (*q.v.*); governor general: Vincent Massey (*q.v.*); prime minister: Louis Stephen St. Laurent (*q.v.*); pop.: (1951 census) 14,009,429, (June 1, 1952) 14,430,000.

History.—As a result of by-elections during 1952, federal parliamentary representation was modified. The new representation was as follows (1949 election results in parentheses): Liberals, 184 (190); Conservatives 49 (41); Co-operative Commonwealth Federation, 13 (13); Social Credit, 10 (10); Independents, 6 (8). In the 1949-52 period, 30 vacancies had occurred in the house of commons and 30 by-elections had been held. The mild Conservative revival indicated by the returns was thought to be public reaction to high taxes and the high cost of living. By the end of 1952, with a federal election discussed for the autumn of 1953, the Liberals hinted at lower taxes, which would automatically reduce living costs.

Legislation.—In a session that lasted from February 28 to

THE DIONNE QUINTUPLETS of Callander, Ont., who reached their 18th birthday and were graduated from high school on May 28, 1952

July 4, parliament put some significant legislation upon the statute books. It authorized establishment of a national library, took more effective power to curtail and prevent restrictive trade practices, extended the unemployment insurance coverage, increased financial assistance to gold miners, increased the amount of money available for loans to farmers and enacted various financial measures.

A major piece of legislation was an amendment to the Canadian constitution, the British North America act, to readjust the membership of the house of commons and to increase it from 262 to 265. Saskatchewan lost three seats, Manitoba two and Nova Scotia one, while British Columbia gained four, Ontario two and Quebec two, because of population shifts. It was the first time in history that Canada's constitution was changed by Canada without consultation and approval of the British parliament. One law passed by parliament in 1952 was an act to authorize the federal government to enter into agreements with the provincial governments pursuant to which, in return for compensation, the provinces would agree to refrain from levying personal income, corporation income and inheritance taxes for five years. The similar 1947 agreement had been signed by seven provinces, Quebec and Ontario refraining; the 1952 agreement was signed by nine provinces, Quebec alone refraining.

External Relations.—During the year Canada signed various agreements with the United States, including a supplementary extradition convention, an arrangement to promote safety on the Great Lakes (see CANALS AND INLAND WATERWAYS) and an agreement to restrict northwest Atlantic haddock fishing. Planning and co-operation between the two countries for the defense of North America continued, including broader exchange of atomic information, joint manning of arctic weather stations and integration of military forces for various training exercises.

Canada was equally active in other international relationships. Parliament ratified the Japanese peace treaty, as well as the North Atlantic Treaty organization protocol extending the guarantees of article 5 to the European Defense Community. Canada's gifts to other nations, besides the military and industrial aid under NATO, included 500,000 lb. of flour to Greece, grants and loans to Ceylon and \$150,000,000 worth of arms to the United Kingdom.

Defense.—The government announced that the nation's defense bill for the year ending March 31, 1953, would total not less than \$1,400,000,000, the highest peacetime military expenditure in Canada's history. A new 600-sq.mi. army camp was started in New Brunswick, planned in size and contour to provide an effective training ground for an armoured division. The Royal Canadian air force created a belt of northern stations equipped to give warning of an approach of enemy aircraft. An expansion of the Canadian navy included the building of 14 antisubmarine vessels with special underwater warfare equipment; all Canadian coastal and deep-sea freighters were scheduled to be equipped with degaussing gear and gun platforms, in order to be prepared against sneak magnetic mine attacks.

Several major military exercises were carried out during the year, including "Sun Dog Three" in Labrador-Ungava, "Eager Beaver" in the Yukon and "Signpost" in Quebec. The defense research board announced experiments with air-to-air guided missiles, new types of antiatomic-radiation clothing, special anti-tank guns and cold-weather military problems. Casualties mounted among the Canadians serving in Korea, and larger numbers of Canadian airmen and soldiers went to Europe for NATO service, but by and large the nation was not too conscious either of the government's defense preparations or of its active participation in war-curbing measures. Civil defense measures were correspondingly half-hearted, but the government planned caches across the country of medical supplies worth \$2,250,000, and

contributed some money to provinces for the stimulation of civil defense steps. (See INDUSTRIAL HEALTH.)

Veterans' Affairs.—Parliament improved the position of war veterans by extending the provisions of the Veterans' Benefits act until mid-1953, by increasing amputees' clothing allowances, by increasing general allowances, by raising the ceiling on permissible income and by assisting employable veterans. By early 1952 the government had, since the end of World War II, paid \$335,964,953 to 714,425 veterans to help them get re-established in civilian life.

Economic Conditions and Controls.—There was evidence of a quickening consumer demand in April 1952, and in May Canadians spent \$1,053,000,000 on consumer goods, a figure that topped the previous all-time high of \$1,005,000,000 in Dec. 1951. Since personal expenditures in Canada were about equal to two-thirds of the value of all goods and services produced by the nation, it was obvious that the 1952 increase in consumer spending had a notably stimulating effect upon employment, over-all production and general business activity. In 1951 consumer spending totalled \$10,400,000,000. Late in Oct. 1952 the government announced a new and more accurate cost-of-living index, which indicated that, using 1949 prices as a base of 100, the index in October was 116.1. The gross national product for 1951 was \$21,241,000,000.

Improved economic conditions during 1952, resulting not only from a greater rate of consumer retail spending but also from the stepped-up defense production activities, led to a relaxation of a number of economic controls, including those on semifabricated copper and aluminum, steel for most types of buildings, chemicals, explosives and pulp and paper materials. After two years of effort, supplies had practically caught up with demand.

Budget and Taxation.—Parliament approved the government's 1952-53 estimates totalling \$4,335,796,800, compared with \$3,370,587,800 for 1951-52. The most significant 1952-53 expenditures (1951-52 in parentheses) were: national defense \$2,001,725,000 (\$1,609,314,371); health and welfare \$727,309,400 (\$474,925,523); veterans' affairs \$228,338,584 (\$213,487,794). For 1952-53 the government expected revenues totalling \$4,514,000,000 (1951-52 actual income, \$4,003,000,000), largely made up of personal income taxes of \$1,260,000,000 and corporation income taxes of \$1,270,000,000 (1951-52: \$980,000,000 and \$1,136,000,000). The 1952-53 customs duties were estimated at \$370,000,000, excise duties at \$240,000,000 and sales tax at \$539,000,000, making a total of \$1,149,000,000, compared with the 1951-52 total of \$1,177,000,000. Taxation for 1952-53 continued high; there was a 6% cut in personal income taxes, but new old-age security taxes cancelled the cut; however, there were excise tax cuts on tobacco, automobiles, appliances and jewellery which would save Canadians \$146,000,000 per year.

Arctic Developments.—The federal government replaced the former Northwest Territories act with a new one that gave greater self-government to the people of the area "so as to make it easier for them to raise their standards of living and add to their well-being and happiness." Territorial courts were re-established, educational facilities were improved, hospitals were aided and roads were planned. During the latter part of July and most of August the federal Pacific naval laboratory at Esquimaux, B.C., sponsored the first official study of the western Arctic ocean when eight oceanographers sailed aboard the "Canolm II," and brought back much scientific data and many samples of arctic water. The Aug. and Sept. 1952 issues of

VINCENT MASSEY, first native-born governor general of Canada, was sworn in at Ottawa, Ont., Feb. 28, 1952. He is seated on the throne from which he opened parliament that evening; to his right is Prime Minister Louis St. Laurent

RECORDERS in the boom town tents of Uranium City, Sask., after the first day of a uranium rush. Prospectors flocked there to register 50-ac. claims when the field was thrown open to the public on Aug. 4, 1952

the federal government monthly, *External Affairs*, published two authoritative articles on the arctic which contained the latest available information about much of the area.

Finance and Banking.—In July 1952 (July 1951 in parentheses) the total of securities held by the Bank of Canada was \$2,160,100,000 (\$2,276,300,000); total current public loans of commercial banks, \$2,928,000,000 (\$2,890,000,000); demand deposits at commercial banks, \$2,885,000,000 (\$2,675,000,000); currency and active bank deposits, \$4,872,000,000 (\$4,750,000,000); cheques cashed at clearing centres, \$10,945,000,000 (\$9,032,000,000) (1951 monthly average, \$9,349,000,000). The net debt of Canada on March 31, 1951, was \$11,433,314,948.

National Accounts.—Net national income at factor cost: salaries, wages and supplementary labour income, (1949) \$7,761,000,000, (1951) \$9,640,000,000; military pay and allowances, (1949) \$115,000,000, (1951) \$201,000,000; investment income, (1949) \$2,445,000,000, (1951) \$3,655,000,000; net income of farm operators, (1949) \$1,504,000,000, (1951) \$2,138,000,000; net income of other unincorporated business, (1949) \$1,369,000,000, (1951) \$1,595,000,000. Gross national expenditure at market prices: personal expenditure on consumer goods and services, (1949) \$10,963,000,000, (1951) \$13,062,000,000; government expenditure on goods and services, (1949) \$2,128,000,000, (1951) \$3,120,000,000; new construction, (1949) \$1,645,000,000, (1951) \$1,993,000,000; new machinery and equipment, (1949) \$1,323,000,000, (1951) \$1,814,000,000; change in inventories, (1949) \$231,000,000, (1951) \$1,650,000,000; exports of goods and services, (1949) \$4,011,000,000, (1951) \$5,099,000,000; less imports of goods and services, (1949) \$3,837,000,000, (1951) \$5,633,000,000; residual error of estimate, (1949) subtract \$2,000,000, (1951) add \$136,000,000.

Trade.—For the first eight months of 1952 exports totalled \$2,839,500,000, imports totalled \$2,596,400,000; during the same period of 1951 exports totalled \$2,495,700,000 and imports \$2,830,500,000.

Agriculture.—Total farm cash income: 1951, \$2,825,520,000; first half of 1951, \$1,251,910,000; first half of 1952, \$1,226,720,000. Quarterly average farm cash income by products—grains, seeds and hay, (1951) \$229,060,000, (second quarter 1952) \$225,410,000; vegetables and other field crops, (1951) \$40,800,000, (second quarter 1952) \$21,220,000;

livestock, (1951) \$257,340,000, (second quarter 1952) \$202,950,000. The official government estimate of the 1952 wheat crop in the west was 651,000,000 bu., an all-time record; in all of Canada the crop was estimated at 675,000,000 bu.

Industry and Manufacturing.—With the 1947 average equalling 100, the July 1952 index of manufacturing inventories and shipments by economic-use groupings (compared with 1951 monthly average in parentheses): consumers' goods—inventories 175.6 (191.4), shipments 159.2 (162.3); capital goods—inventories 188.8 (178.6), shipments 234.8 (198.7); producers' goods—inventories 198.1 (198.7), shipments 173.1 (174.0). Inventories of all industries by components in June 1952 (with 1951 monthly average in parentheses): raw materials, \$1,745,500,000 (\$1,859,800,000); goods in process, \$654,200,000 (\$588,100,000); finished products, \$1,065,600,000 (\$1,015,200,000).

Employment.—Labour force (survey averages): 1950, 5,157,000; May 31, 1952, 5,329,000. Without jobs and seeking work (survey averages): 1950, 169,000; May 31, 1952, 107,000. Labour income: 1951 monthly average, \$803,000,000; May 1952, \$876,000,000. Industrial composite weekly earnings: 1951 monthly average, \$49.61; July 1952, \$53.90. During the first seven months of 1952 there were 143 strikes and lockouts involving 97,324 workers and a time loss of 2,204,363 man-working days, compared with the first seven months of 1951, when there were 165 strikes and lockouts involving 49,126 workers and a time loss of 347,525 man-working days.

Minerals and Natural Resources.—Production of various minerals in July 1952 (with July 1951 in parentheses): copper, 39,400,000 lb. (45,100,000); nickel, 20,700,000 lb. (23,700,000); lead, 22,500,000 lb. (22,100,000); zinc, 68,400,000 lb. (57,600,000); iron ore, 902,900 tons (717,900); gold, 375,000 fine oz. (344,000); silver, 1,771,000 fine oz. (1,794,000); asbestos, 69,400 tons (71,000); gypsum, 67,700 tons (73,500); cement, 1,607,000 bbl. (1,538,000).

Canadian Literature. Fiction.—No mountains—indeed, no hills—rose above the modest plain of Canadian literature in 1952. This was an embarrassment for critics who had been anticipating an upsurge of creative effort to match Canada's economic boom; and it was a disappointment for readers who had been expecting increased and improved production from Canada's growing body of literary talent. Nor were the embarrassment and the disappointment assuaged by the appearance of four new novelists, even though they showed more than usual talent. Their talent was so overburdened by faults that in the end the faults hid the talents. The best work of the four was Ernest Buckler's *The Mountain and the Valley*, a nostalgic account of Nova Scotian farm life; next best was Basil Partridge's *The Penningtons*, a saccharine account of Canadian family life during the early years of the 20th century. But in both cases the melancholia and the sweetness were laid on with slightly heavy hands. The deft touch was also lacking in Doris Hedges' *Dumb Spirit*, a fantasy in which a dead man returned to life in the body of a cocker spaniel, and in Charles L'Ami's *The Green Madonna*, an historical novel in which blood and balderdash obscured the tapestry of 15th-century events in England. Established novelists who returned with new works included: Mazo de la Roche, *A Boy in the House*; Isabelle Hughes, *Lorena Telforth*; Ethel Wilson, *The Equations of Love*; Marian Keith, *Lilacs in the Dooryard*; and Arthur Mayse, *The Desperate Search*. All were workmanlike in their separate fields; none was distinguished by strokes of genius.

Poetry and Drama.—Low public interest in poetic and dramatic writing was reflected in the meagre 1952 crop of poetry and printed plays. Veteran E. J. Pratt presented *Towards the Last Spike*, a 1,500-line narrative poem which captured the essence of the drama of building the Canadian Pacific railway back in the 1880s; satiric Earle Birney presented *Trial of a City and Other Poems*, a collection of strong verse through which ran an obvious thread of criticism of man and his works. The rest of the 1952 poetic output was confined to ephemeral chapbooks. Plays appearing in print included Maurice Corbett's *The Woman Called X* and Robertson Davies' *A Masque of Aesop*. Munro MacLennan

published a curious poetic poem in three acts, *Seven Caesars' Ransoms*.

Nonfiction.—There was no clear explanation of why Canadian literature leaned so heavily away from imaginative writing. For one novel or one book of poems that saw print, there were a dozen sober treatises on personages, travel, nature lore, politics, economics and the like. Canadian writers had a remarkable knack of taking themselves seriously. The most significant biography of the year was Donald Creighton's *Sir John A. Macdonald: The Young Politician*, which covered with lively humanity the preconfederation career of Canada's first prime minister. The most significant autobiography of the year was C. L. Burton's *A Sense of Urgency*, the memoirs of a major Canadian merchant which contained many first-time-told tales of Canadian commercial practices. Another personal narrative of interest as well as challenge was Farley Mowat's controversial *People of the Deer*, the Eskimo of the Keewatin district of the arctic. There was a subjective approach, also, in J. Harry Smith's *Newfoundland Holiday*, which was freighted with folklore and history in addition to personal experiences. Other Canadian areas were subjects of books during 1952. Ken E. Liddell's *This Is Alberta* was a racy volume designed to catch the tourist's eye; Jean Burnet's *Next-Year Country* was a serious study of rural social organization. O. M. McConkey wrote of *Conservation in Canada*, and his book was valuable because it was the first comprehensive survey of the matter. *Canada: The Golden Hinge* by Leslie Roberts was the best contemporary account of Canadian development and potentialities yet written. As usual, Canadian writers cast glances backward in 1952: A. R. M. Lower analyzed the background of *Canada: Nation and Neighbor*; Grant MacEwan reported the conquest by agriculture of that part of Canada lying *Between the Red and the Rockies*; D. A. MacGibbon usefully discussed *The Canadian Grain Trade, 1931-51*. Efforts to assess Canadian literature were made by A. L. Phelps in *Canadian Writers* and by Desmond Pacey in *Creative Writing in Canada*, but both appraisals were disappointingly short of being definitive.

Juvenile.—The slump from previous years in the production of juvenile books was discouraging to both parents and educationists. Juvenile novels included Jack Hambleton's *Charter Pilot*, Janet Carruthers' *The Forest Is My Kingdom* and G. E. Tait's *Wake of the West Wind*, all with settings in Canadian forests. Marianne Macdonald used Lake Ontario cruising as a background for her stirring *Black Bass Rock*; June Dennis dipped into the radio world in *A Mike for Marion*; Earl C. Merrick went to Bolivia for the adventures of *Paco of the High Country*; Scott Young used his hockey reporting experiences for *Scrubs on Skates*. The best juvenile nonfiction of the year was Mary Q. Innis' *Changing Canada: New France and the Loyalists*, closely followed by Marie McPhedran's *Cargoes of the Great Lakes*. (C. Cy.)

French.—*Les Enfances de Fanny*, an autobiographical novel by Louis Dantin, threw much light on the tragic life of this well-known poet and essayist, while *L'Ampoule d'or* by Léo-Paul Desrosiers was a lyrical narrative inspired by the quest for happiness in the picturesque Gaspé setting. These were the only two novels by established authors to appear in 1952.

Three young poets showed early promise. They were Fernand Dumont whose *L'Ange du matin* was made of short pieces, barren in style but rich in spiritual experience; Pierre Trottier, a young Romantic who took up the cudgels in *Le Combat contre Tristan*; and Sylvain Garneau, who blended irony and emotion in picturesque narratives in *Les Trouble-fête*.

In the field of history the most important work was *Le Grand marquis* by Guy Frégault, a biography of Vaudreuil; *Réalités françaises de Cartier à Montcalm* by Gustave Lanctôt, dealing mainly with civil administration and militia in New

France; the second volume of *Histoire du Canada français* by Lionel Groulx, a bird's-eye view of the years 1713-63; *Le Régime militaire dans la gouvernement des Trois-Rivières* by Marcel Trudel; and *L'Histoire du Canada par les textes*, a repository of the most significant documents on Canadian history, compiled by Guy Frégault, Michel Brunet and Marcel Trudel.

The only play of distinction published in 1952 was *Brutus* by Paul Toupin, a drama in three acts about the friendship of Brutus and Caesar.

(G. SR.)

Canals and Inland Waterways. Of the estimated 65,000 mi. of potential inland waterways in the United States, approximately 28,600 mi. had been improved by the end of 1952 for navigation by commercial and pleasure craft. All operations and maintenance of the system, which included 417 commercial ports, 312 locks and 219 navigation dams, is the responsibility of the corps of engineers, department of the army, under the direction of congress.

The principal components of the over-all interrelated system of rivers, lakes, bays and canals include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York state canal system, the Cape Cod canal, the Chesapeake and Delaware canal, the Atlantic intracoastal waterway, the Gulf intracoastal waterway, the Sacramento river system and the Columbia river system.

The Rivers and Harbors act approved July 11, 1952, provided for \$158,435,800 for the construction of 26 projects in 23 states. An additional \$73,458,900 was appropriated for maintenance, operation and care of the nation's vast network of ports and inland waterways; \$405,000 was allotted to advance planning; \$825,000 to examination, survey and other study programs; \$3,664,100 for transfer to other federal and state agencies. A special \$100,000 was allotted for Niagara river investigations in New York state. Also, in addition, the lower Mississippi river and the Sacramento river in California received separate appropriations of \$60,020,000 and \$1,000,000, respectively, for construction, maintenance and operations.

Among the principal projects on which construction was begun or continued during the year were the Dalles lock and dam, McNary lock and dam and Chief Joseph dam on the Columbia river in the interest of navigation, power development, flood control and irrigation; the New York and New Jersey channels; Demopolis lock and dam on the Tombigbee-Warrior system, Alabama; the Gulf intracoastal waterway, Texas; Cleveland harbour, Ohio; the Arkansas river and tributaries, Arkansas and Oklahoma; the lateral canal and lock project at Chain of Rocks on the Mississippi river near St. Louis, Mo.; Morgantown dam and lock no. 2 on the Monongahela river, Pennsylvania; the Missouri river between its mouth and Sioux City, Ia.; Buford dam on the Chattahoochee river, Georgia; Cheatham lock and dam and Old Hickory lock and dam on the Cumberland river, Tennessee; and Jim Woodruff lock and dam, Apalachicola river, Florida.

According to preliminary estimates, the total net water-borne commerce of the United States, eliminating all known duplications of traffic between rivers and ports, was 923,931,053 short tons in the calendar year 1951. Ocean traffic, foreign and coastwise, aggregated 418,617,598 tons.

United States water-borne commerce on the Great Lakes totalled 178,463,212 tons. Inland waterway commerce, excluding the Great Lakes, totalled 213,407,633 tons, including deep-sea traffic on the Mississippi river below Baton Rouge, La. Intraport tonnage totalled 50,952,725; local hauls amounted to 61,243,109 tons; and intraterritory hauls totalled 1,246,776 tons.

(G. HB.)

Canada.—Although Canadian plans for the deepening of the St. Lawrence seaway remained largely in the discussion stage during 1952, some definite steps were taken. The federal government set up a special projects branch within the department of transport to prepare detailed plans and designs for the project, which was expected to give jobs to 9,500 men. The government of Ontario passed a bill at a special autumn session of the legislature to give river residents between Cornwall and Iroquois on the St. Lawrence the choice of compensation or rehabilitation for their properties to be lost by flooding and "to make up for loss of their old environment, traditions and sentimental attachments." The International Joint commission held hearings throughout the year; by September the commission had heard 13 major briefs concerning the project, of which only 3 were against it.

To increase the safety factor of shipping on both Canadian and United States inland waterways, Canada and the United States signed a treaty providing for a uniform system of marine radiotelephony on the Great Lakes and related watercourses. Tonnages taken up and down through the three major lock systems of the St. Lawrence river-Great Lakes system, for the April-Sept. 1952 period, showed a general falling-off when compared with the similar 1951 period (in parentheses): St. Lawrence, 7,264,357 (7,381,271); Welland, 13,136,408 (11,781,008); Sault Ste. Marie (Canadian-U.S.), 74,928,489 (90,273,598); Sault Ste. Marie (Canadian only), 2,387,259 (1,898,862). (See also ELECTRICAL INDUSTRIES.) (C. Cy.)

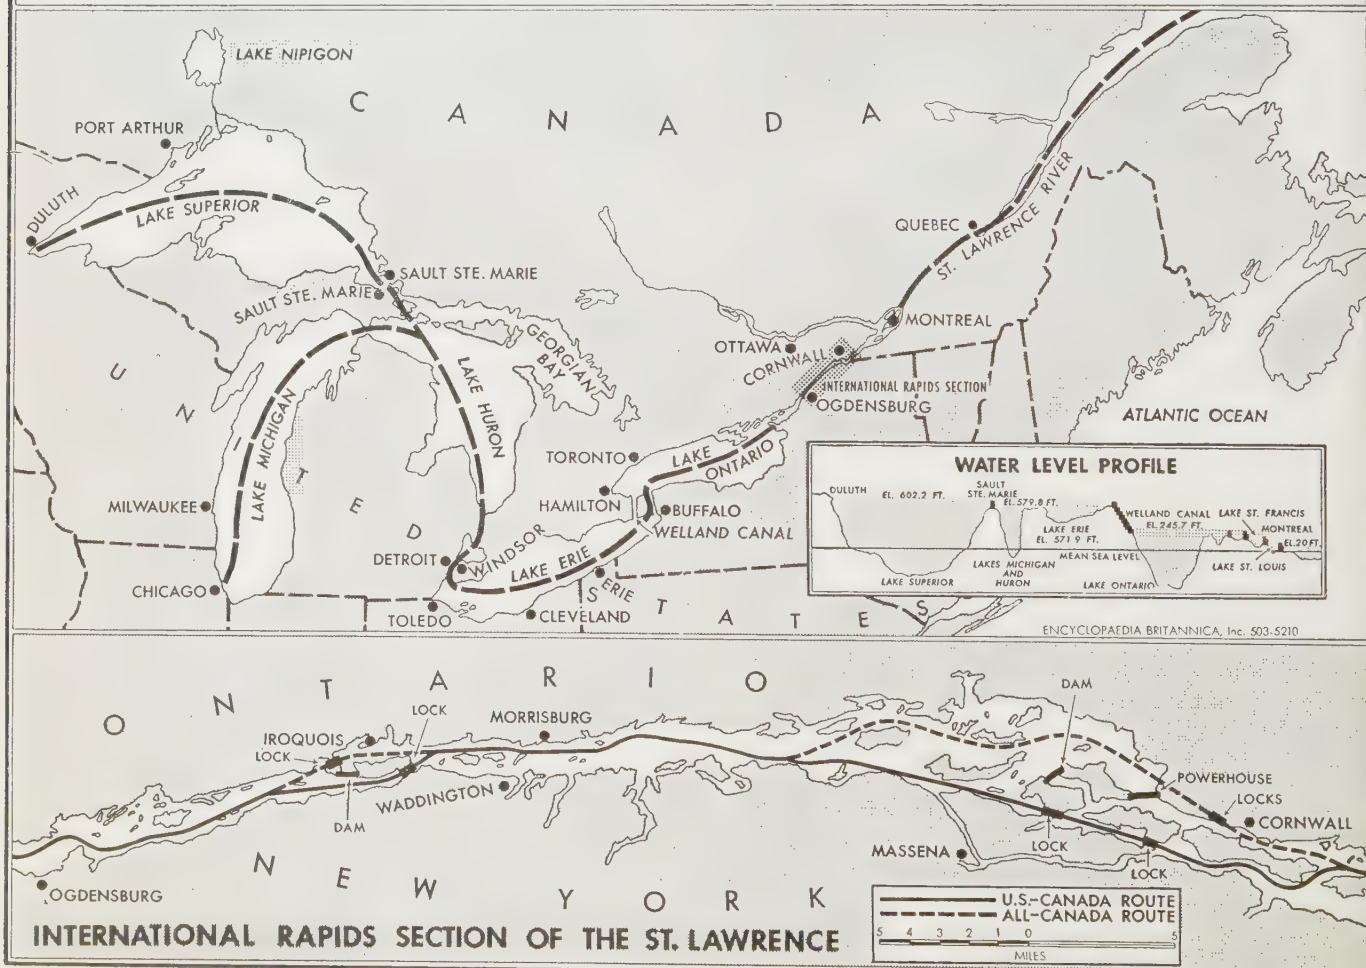

Great Britain.—The fourth annual report of the British Transport commission was published in July 1952. It recorded

that during 1951 the Docks and Inland Waterways executive acquired the Monkland canal, Lanarkshire, the Bridgwater and Taunton canal, the Tone river navigation, Somerset, and the Grand Western canal. Development of the main waterways was advanced, particularly on the Severn river at Worcester and at Newark Town lock on the Trent river. Total traffic carried on the waterways in 1951 was 12,236,000 tons, as against 11,802,000 tons in 1950, consisting of 5,844,000 tons of coal and coke, 2,036,000 tons of liquids in bulk and 4,356,000 tons of general merchandise. The British Transport commission's own fleet represented about one-fifth of the total carrying capacity engaged on the waterways. In 1951 gross receipts from state-owned waterways amounted to £1,761,035 and working expenses to £1,947,487, showing a deficit of £186,452. In carrying operations, gross receipts amounted to £806,934 and working expenses to £895,214, making a deficit of £88,280.

Belgium.—Progress was made with extensive modernization of the network of Belgian waterways and especially those ports connecting industrial districts with the ports of Antwerp, Ghent, Ostend and Zeebrugge. The widening and deepening of the whole length of the canal joining Charleroi with Brussels would make it accessible to vessels up to 1,350 tons. It would then be possible to dispense with the one-kilometre tunnel used by boats at Godarville.

Netherlands.—The great Tiel lock was opened, inaugurating the new Amsterdam-Rhine canal and marking the conclusion of a project first authorized in 1931. Amsterdam thus became the nearest seaport to the Swiss, German and French industrial districts bordering on the Rhine river. The lock at Tiel, more

than 1,180 ft. long and the largest inland lock in the world, was constructed in monolithic form and founded on piles.

U.S.S.R.—A canal was opened joining the Volga river to the Don river, thereby completing a water transport route from the Baltic to the Black sea. Work had been begun before World War II and was resumed in 1947. More than 60 mi. of canal were cut across the steppes from Stalingrad to Kalach and construction works included 13 sluices, 3 dams and a large number of pumping stations, bridges and wharves. (See also **AQUEDUCTS; FLOODS AND FLOOD CONTROL; IRRIGATION; RIVERS AND HARBOURS.**)

Cancer. An estimated 220,000 persons died in the U.S. from cancer during 1952, a moderate and anticipated increase over 1951. Such increase was considered to be largely the result of the increasing life span (there were 44,500,000 living persons 45 years and older), and to a lesser extent of generally more accurate diagnosis. However, a few types of cancer, notably cancer of the lung, appeared to be increasing more rapidly than could be explained solely on these bases. At the same time, reports from numerous sources indicated that more cancer was being cured than ever before.

Nation-wide programs of cancer control, conducted by the American Cancer society and the federal government's National Cancer institute, sought to increase the awareness of the public to the early signs of cancer; to inform practising doctors of new developments in the field; to improve cancer education and training in medical schools and hospitals; to raise the standards of diagnosis and treatment; and to assist needy cancer patients. The same agencies supported broad programs of research into the causes of cancer and better methods of diagnosis and treatment.

The general public contributed \$16,500,000 to the American Cancer Society, Inc., for its combined program of research and control, and an additional \$1,500,000 to the Damon Runyon Cancer Research fund. The federal government's appropriation

for similar purposes was \$19,700,000. The year saw 16 new cancer research buildings (aided by grants from the United States public health service) completed and put into operation, making a total of 42 such facilities constructed since 1948. The number of approved cancer diagnostic clinics decreased by 3 to a total of 116, and approved cancer clinics (for treatment and diagnosis) numbered 497, or 55 more than in the previous year.

More widespread and intensive efforts were made to find cancer in presumably healthy persons, before symptoms appeared. Mass chest X-rays were offered in many communities, and the results of these demonstrated that a patient with lung cancer has a sevenfold greater chance of being cured if treated before symptoms appear than after. The smear method of diagnosis found wider acceptance and its value in detecting cancer of the womb, prostate, bladder, kidney, lung and large intestine was further established. The method was extended to the stomach, by means of a small net-covered balloon swallowed by the patient, inflated, and later withdrawn; cells clinging to the net could be washed off and examined under the microscope, indicating with high accuracy the presence or absence of cancer.

A trend toward more radical surgical operations was noted, especially in cancer of the pelvic organs (uterus, bladder, prostate) and cancer of the breast. In selected cases of breast cancer, the chest wall was opened and deep-lying lymph glands, hitherto regarded as inaccessible, were excised.

Further evidence of the relationship of hormones to cancer was brought forth by C. Huggins and D. M. Bergenstahl, who noted substantial improvement in about half of the patients with advanced cancer of the breast or prostate following removal of the adrenal glands.

Attempts were made to control advanced prostate cancer in two patients by removing the pituitary gland, situated at the base of the brain; both patients improved.

Advances in the irradiation treatment of cancer were highlighted by the installation in several institutions of large bombs of radioactive cobalt, having energy equivalents of X-rays generated at 2,000,000 v., and by the use of radioactive metal wires threaded into tumour areas.

Interest in basic research tended to focus on the chemistry of the nucleus of the cancer cell, whose synthesis of amino acids appeared to differ from that of normal cells, although the sig-

CANCER PATIENT being treated in 1952 with the largest radium unit used in the U.S. to that date. He is shown under a beam from the giant container in a special radiation-proof room at the Roosevelt hospital, New York city, as a nurse attended outside a glass port

nificance of this observation was not clear. The search for chemical compounds having specific destructive effects on cancer cells developed several substances which destroyed cancer in experimental animals without killing the animal hosts, a unique accomplishment. Certain viruses causing noncancerous diseases in man and animals were found to have affinity for some animal cancers which they partially destroyed and efforts were made to train such viruses for attacking cancer in humans. Clinical and research developments of 1950-52 were summarized and discussed at the second National Cancer conference, held in Cincinnati, O., March 3-5, 1952. Candy. As 1952 drew to a close, estimates indicated that the dollar volume sales of candy in the United States for the year would be approximately \$1,000,000,000, compared with \$965,000,000 in 1951 and the record of \$1,001,000,000 in 1948. The bureau of the census reported that for the first seven months of 1952, 1,365 candy manufacturers, employing 75,000 persons, recorded sales of \$484,854,000, or an increase of 1% over the first seven months of 1951. The heaviest production and sales are recorded in the second half of the year, especially from October to December.

Tonnagewise, the latest available figures toward the end of the year pointed to an estimated volume of 2,700,000,000 lb., a slight increase over the 2,668,800,000 lb. reported for 1951.

The most significant development in the candy industry during 1952 was the move by candy manufacturers to develop and open new outlets for their products. As a result, increased sales of candy were reported by vending-machine operators in indus-

trial plants and institutions, supermarkets gave more space and bigger displays to candy, and drug and variety chains increased their activity in candy merchandising.

Other major developments of the year were: (1) emphasis on the manufacture and marketing of dime bars and other ten-cent candies; (2) greater interest in research on product development; (3) continued stress on the mechanization of candy production; (4) the creating of new merchandising methods of selling candy, especially the designing of a ten-cent rack; (5) increased activity by importers of candy from abroad; and (6) heavier expenditures by candy manufacturers on advertising and promotional efforts.

The greatest gain in the industry was made by manufacturers of popular-priced packages, especially those ranging in the 29- to 59-cent class. Other advances were shown in packages ranging in price from 49 to 99 cents a pound. Packages retailing at from 50 to 59 cents per pound accounted for approximately 10% of the dollar volume, while packages designed to sell for less than 50 cents per pound represented 12% of sales.

Bulk goods amounted to 13% of the dollar volume, while sales of penny goods were insignificant. Bar type candies accounted for 45% to 48% of the industry's tonnage.

Chocolate-coated and chocolate-containing candies continued to lead the field in consumer popularity, despite the fact that cocoa bean prices remained high.

The average price of candy at the wholesale level was 34½ cents per pound, or about the same as reported in 1951. Ten years earlier the average wholesale price for candy per pound was a little more than 16 cents.

As in previous years, the United States continued to be the greatest candy-producing country in the world. Per capita consumption in 1952 was estimated at 17½ lb., a slight decline from the 18 lb. recorded for 1951 and the 18.1 lb. for 1950. The all-time record of 20.5 lb. per capita consumption was established in 1944. The low of 13 lb. per capita was reached in 1932 and 1933.

Imports of candy into the United States showed an increase

over 1951, while exports declined. It was estimated that more than 12,000,000 lb. of candy were imported in 1952, compared with 7,000,000 lb. in 1951.

The United Kingdom, France, the Netherlands, Switzerland, Sweden, Finland and Denmark were the principal candy importing countries in 1951.

(H. D. G.)

Cane Sugar: see SUGAR.

Canning Industry. The United States and territorial pack of canned fruits, fruit juices, fruit and vegetable specialties, vegetables, milk, fish and meat in 1951 totalled approximately 648,000,000 standard cases (final statistics) compared with 588,000,000 cases in 1950, an increase of about 10%. With the exception of canned fish, which showed a substantial decrease, all packs were significantly larger than in 1950. The total pack was the highest on record.

In Table I is shown the production of various canned foods in the United States for the years 1938 to 1951, and in Table II the civilian annual per capita consumption for the same period.

From 1923 to 1952 the prices of canned fruits and vegetables showed a maximum variation of only 78.3 index points compared with 147.5 points for the all food index, and 171.4 points for fresh fruits and vegetables. The high point of canned fruit and vegetable prices was reached in 1947, while the index for all foods was still rising and reaching record highs throughout most of 1952. By the end of the third quarter of 1952 canned fruit and vegetable prices stood at about one and two-thirds the 1935-39 average while the average for all foods was about two and one-third times this pre-World War II average, and for fresh fruits and vegetables two and two-thirds times as high.

In 1952 the extended steel strike threatened serious container shortages in the canned food industry. However, prompt action by the National Production authority in allocating existing supplies to canners of perishable fruits and vegetables averted seri-

ous consequences to the industry. Consumption of steel for food cans in 1951 amounted to about 1,900,000 tons.

The canning industry in the United States comprised in 1952 more than 3,500 canneries in 47 states and the territories. These plants were producing annually all the basic canned foods totaling more than 400 items, utilizing more than 20,000,000,000 cans and jars, and adding up to about \$4,000,000,000 in value at retail.

In the field of fundamental research further progress was made in studies relating to sterilization by means of ionizing radiations. Research was continued in the laboratories of the National Canners association, other industry laboratories and in various universities. The United States Atomic Energy commission expanded its support of work designed to demonstrate the possible use of "gross fission products" which are produced as waste products by the operation of nuclear chain reactors. It was recognized that several years of fundamental research in this field would be necessary before industrial utilization could be made.

(E. J. C.)

Other Countries.—An important event in 1952 was the bringing into operation during September of the first of two electrolytic tinning lines in the largest and most modern tinplate plant in the world, at Trostre, South Wales, with a capacity of about 350,000 tons a year and with provision for expansion. An innovation in Great Britain was the use of cans labelled by printing on the tinplate before fabrication with special inks resistant to steam and high temperatures. Such cans had been available in the United States for several years, but the synthetic materials used in their formulation had not been available elsewhere.

Statistics published during the year by the ministry of food showed that United Kingdom production of canned vegetables decreased from 322,600 long tons in 1950 to 299,800 long tons in 1951, including 119,800 tons of processed dried peas, 94,200 tons of baked beans, 33,500 tons of fresh peas, 20,500 tons of macaroni and spaghetti and 12,900 tons of carrots. Canned fruits fell from 75,100 tons in 1950 to 74,600 tons in 1951, including 36,600 tons of plums, damsons and greengages, 8,400 tons of apples, 6,900 tons of gooseberries, 5,600 tons of cherries, 5,100 tons of strawberries, 4,800 tons of other berries and currants, 3,700 tons of rhubarb and 3,500 tons of other fruits. Other canned foods included 72,000 tons of soups, 7,900 tons of baby foods, 9,600 tons of meats and 72,800 tons of milk. The largest items in production were processed peas and baked beans, which kept the canneries in operation throughout the year, outside the short seasons for fresh fruits and vegetables.

The relative importance of the canning industries of different countries was roughly proportional to their consumption of tinplate. Statistics published by the International Tin Study group showed that, out of the world consumption of nearly 6,000,000 tons, the United States used (in round figures) 4,000,000 tons, the U.K. 500,000 tons, Canada 210,000 tons, Germany 150,000 tons, France 120,000 tons, Australia 110,000 tons, India 100,000 tons, Japan 80,000 tons, Italy 75,000 tons, the Netherlands 75,000 tons and South Africa 60,000 tons.

(G. H. M. F.)

Capehart, Homer Earl (1897—), U.S. senator, was born on June 6 at Algiers, Ind. Not continuing his education beyond high school, he began work as a salesman in Chicago in 1919 after serving two years in the U.S. army. In 1927 he established his own company, the Capehart corporation, manufacturers of phonographs, at Ft. Wayne, Ind. The company was later merged with another and Capehart went on to organize other enterprises. He became interested in politics about 1938 and in 1940 supervised the Elwood, Ind., ceremonies at which Wendell L. Willkie accepted the Republican

*Derived by U.S. department of agriculture from data on production and utilization. From the annual supply of each food (production plus carry-over stocks plus imports) are deducted exports, government purchases, and carry-over stocks. The residual is considered to be civilian consumption. This is divided by estimated population to determine per capita consumption.

†Estimated on the basis of total population, rather than on the population of babies. On the basis of the number of children under the age of 3 years, consumption of baby foods in 1951 amounted to about 60 lb. per child a year.

‡Calculated by statistics division, National Canners association.

§Estimated. ||Preliminary.

nomination for president. Capehart subsequently was elected U.S. senator from Indiana on the Republican ticket for the term 1945-51 and was re-elected for the term 1951-57. An early critic of the New Deal, he opposed the bulk of legislation proposed by Presidents Franklin D. Roosevelt and Harry S. Truman, although he occasionally voted for administration-sponsored measures, such as U.S. participation in the United Nations and military and economic aid to Greece and Turkey. Later, however, he became one of the senate's strongest opponents of President Truman's foreign policy, calling for dismissal of Secretary of State Dean Acheson and scoring the removal of Gen. Douglas MacArthur in 1951. Capehart sponsored the price-control amendment bearing his name, which authorized passing on to consumers all increases in prices occurring during the first year of the Korean war.

Cartography. International.—The centre of international cartography in 1952 was the United States, where two major meetings pertaining to mapping were held. The 17th International Geographical congress of the International Geographical union met in Washington, D.C., Aug. 8-15. The congress was held in the United States in connection with the centennial of the American Geographical society. Three sectional meetings were devoted to cartography and the 30 papers presented by representatives of American, European and African nations covered a wide range of topics from mathematical to historical cartography.

The International Map of the World (*Carte du Monde au 1:1,000,000*), which before World War II was an important and progressive international effort, was a major item of discussion at the congress. Various map series and aeronautical charts developed during that war for military purposes had eclipsed the international map and little progress had been made on it since 1946. At the 17th International Geographical congress it was brought out that the military maps or aeronautical series did not satisfy the needs for a detailed map of the world, and steps were taken for the rejuvenation of the International Map of the World at a scale of 1:1,000,000.

In addition to the regular cartographic meetings of the congress there was a convening of the Commission on Bibliography of Ancient Maps. The work of this committee was expected eventually to prove of greatest interest to students of historical cartography. An elaborate display of maps from European, African and American countries was a part of the congress and included a number of new maps and map series.

The Seventh International Congress of Photogrammetry closely followed the Geographical congress. About 1,200 persons from 37 countries in Europe, America and other parts of the world attended the meetings in Washington, D.C., Sept. 4-16. The congress was held in the United States as a part of the Centennial of Engineering. Numerous papers on maps, mapping techniques and allied photogrammetric fields were presented. A display of maps and surveying instruments was a part of the meetings. The display included methods of aerial photo interpretation, mapping techniques and many published maps seldom seen by the public. Included in the last named were the new 2½-, 6- and 25-inch maps and plans of Great Britain; new 1:25,000, 1:50,000 and 1:100,000 maps of Switzerland; and 1:25,000 and 1:50,000 scale maps of Portugal. Similar large-

THE STEREOSIMPLEX, an Italian-made instrument for plotting maps from aerial photographs, first shown in the U.S. in 1952. It permitted use of aerial photographs taken at altitudes of 10,000 ft., compared with 2,500 ft. with U.S. equipment

scale products of the Netherlands, France, Italy and Austria were exhibited. Information concerning the new 1:20,000 scale topographic map of Luxembourg being prepared by the Institut Geographique National (France) was released at the congress. Similar data concerning the basic topographic mapping of Turkey at 1:25,000 scale were presented. Both the Luxembourg and Turkish series were based entirely on aerial photography.

Two other conferences concerning international cartography in the Americas were held in 1952. The Third Pan-American Consultation on Geography held in Washington, D.C., July 25 to August 4 devoted some attention to mapping. The Sixth International Consultation on Cartography was held at Ciudad Trujillo, Dominican Republic, Oct. 11-24.

America.—The centennial year of the American Geographical society of New York city was celebrated in 1952. This institution had long been a recognized leader in the field of American cartography. In its hundred years of existence it had issued a wealth of mapping data as a part of its publications covering the sciences of geography and exploration. However, its greatest cartographic contribution was the preparation of the 1:1,000,000 scale map of Central and South America. This set of 107 sheets, covering all the Americas south of the United States, was begun shortly after World War I and was completed at the end of World War II. It had been accepted as a part of the International Map of the World and represented the acme of pre-World War II cartography in America. During World War II the society contributed considerable information as well as technical aid to the war effort. From 1945 and into its second century the society had given continued emphasis to cartography and by 1952 was well on its way toward producing another notable series of maps, the *Atlas of Disease*. Two additional sheets (no. 4 and 5) of this atlas were issued as supplements to

the *Geographical Review* in 1952. The maps, in colour, were compiled by Jacques May and one covered the world distribution of helminthiasis while the other depicted the distribution of dengue and yellow fever. Each map was accompanied by tables and text that fully explained the cartographic data.

A notable atlas was published in 1952 by Prentice-Hall for the University of Maryland. This atlas, the *Mineral Resources of the World*, was compiled by William van Royen and Oliver Bowles of the university's department of geography in collaboration with Elmer W. Pehrson of the U.S. bureau of mines. It was volume 2 of the *Atlas of World Resources*. The atlas had maps showing the world distribution of 29 mineral commodities. Each map was accompanied by text and tables compiled for the atlas by American authorities. The atlas filled a gap in American cartography and replaced a similar but obsolete 1921 publication of the U.S. geological survey.

The first two sheets of the *Hedin Atlas of Central Asia* were issued by the U.S. army map service in 1952. These maps at a scale of 1:1,000,000 were designed along the lines of the international map and would eventually cover much of Tibet and western China. They were based on original field surveys by the Swedish scientist Sven Hedin and other explorers. A previous start on the atlas was made by the Germans in 1938 but the war caused cancellation of the work after three maps were published.

In the field of cartographic bibliography an important contribution was made by the U.S. national archives. Its preliminary inventory, no. 45, *Cartographic Records of the Federal Housing Administration*, compiled by Charlotte Munchmeyer, contained many data of value to the cartographer interested in urban areas.

The Canadian Board on Geographical Names (formerly the Geographic Board of Canada) published the first volume of a detailed *Gazetteer of Canada*. This volume, covering southwestern Ontario, gave a complete list of place names keyed to the topographic maps of Canada by latitude and longitude.

Europe.—In Germany, private cartography began the production of detailed topographic maps. The first of a series of maps of the antarctic at a scale of 1:1,000,000 to conform to the style of the international map was published in volume 6 (1952) of the geographical periodical *Erdkunde*. The compiler H. P. Kosack was a student of the antarctic and indications were that a series of standard maps at a scale of 1:1,000,000 was planned that would eventually map the entire antarctic. From Germany there were also received two new and important texts on cartography: *Kartentechnik*, by Heinz Bosse, in two volumes, was published as *Ergänzungsheft 243* and *245* of Petermann's *Geographische Mitteilungen*, and Ulrich Graf's *Mathematik für Kartographen* was no. 244 of the same publication.

Cement. World production of cement had been expanding rapidly since the low of 1945, having nearly trebled output in six years. The production was widely distributed, with more than 70 countries contributing, but of the 145,000,000 short tons reported in 1950 the United States supplied 30%, Germany, the U.S.S.R. and the United Kingdom 8% each, France 5%, Italy 4% and Japan 3%—two-thirds of the total in seven countries.

United States.—The salient features of the cement industry in the United States were reported by the U.S. bureau of mines as follows:

Cement Industry in the U.S.

(Millions of barrels)

	1944	1945	1946	1947	1948	1949	1950	1951

Production and shipments made new record highs in both 1950 and 1951. In the first eight months of 1952 production dropped slightly from the 1951 level, with 158,988,000 bbl., compared with 160,388,000 bbl. in the same period of 1951. On the other hand, shipments ran ahead of 1951, with 164,163,000 bbl., compared with 162,012,000 bbl. With production down and shipments up, stocks declined.

(G. A. Ro.)

Censorship: see LAW.

Census Data, U. S. The census of 1950 was the 17th in a series of decennial censuses which extends back to 1790. A simple count of the people, classified as slave and free, would have been sufficient to comply with the constitutional requirement of a census to serve as a basis for the apportionment of members of congress among the states, but even the first census provided in addition some information about the make-up of the families recorded; and the extent of the additional information collected has increased decade by decade, until in 1940 the published results of the census of population and housing occupied about 45,000 pages, mainly quarto tables set in six-point type.

Some data on housing were collected in the censuses of 1890, 1900, 1910 and 1920, primarily information on home tenure, in some cases including mortgage status of owned homes. The tenure questions were continued in 1930, with the important addition of a new question on value of owned homes and monthly rental of rented homes.

The returns from this question served, incidentally, as an index of family income; in fact, the use of this classification as a general index of potential buying power, etc., may have been more important than its use as an element in the description of housing as such.

The interest in housing data was increasing, however, and in 1940, after extended work on the part of a special committee in formulating an adequate and reasonable set of questions, there was set up a formal census of housing, with its own separate schedule, taken at the same time as the population schedule and for some purposes correlated with the population schedule in tabulation. The reports of this housing census occupied a substantial part (perhaps 40%) of the published reports of the 1940 census; and in 1950, with a census program substantially similar, the name of the administrative subdivision in the

bureau of the census which handled these two features of the decennial census was changed to population and housing division.

Significant figures from the 1950 housing schedule are presented in Tables X, XI and XII.

Landmarks in the development of census methods were the adoption, in 1850, of a schedule requiring the collection of information about each individual in the family in place of a summarized statement for the family, as in prior censuses; the introduction of machine tabulation through the use of punched cards in 1890; and possibly the use of sampling in 1940, in the form of a list of additional questions on the schedule to be asked only of 1 person in 20, which provided material for a series of important supplementary reports.

Population Growth.—The population of the United States in 1790, when the first census was taken, was only 3,929,214, and even a 35.1% increase brought it up to only 5,308,483 in 1800. The rapid increase continued, however, at around 35% per decade up to 1860, when the total amounted to 31,443,321. Then there was a gradual slowing down in the decennial rate of increase, to a minimum of 7.2% in the depression decade, 1930-40, followed by an unexpectedly rapid growth between 1940 and 1950, amounting to 14.5%.

Table I.—Population and Land Area of the United States

Year	Total number	Increase over preceding date	Land area (sq. mi.)	Population per sq. mi.
		Amount	Per cent	
By 50-year periods:				
1800	5,308,483	—	867,980	6.1
1850	23,191,876	17,883,393	2,944,337	7.9
1900	75,994,575	52,802,699	2,974,159	25.6
1950	150,697,361	74,702,786	2,974,726	50.7
By decades:				
1900	75,994,575	—	2,974,159	25.6
1910	91,972,266	15,977,691	2,973,890	30.9
1920	105,710,620	13,738,354	2,973,776	35.5
1930	122,775,046	17,064,426	2,977,128	41.2
1940	131,669,275	8,894,229	2,977,128	44.2
1950	150,697,361	19,028,086	2,974,726	50.7

Taking the growth over the last century and a half in 50-year periods, as presented in Table I, it would appear that the population in 1850 was about 4½ times that of 1800 (increase in the 50 years, 336.9%); in 1900 the population was about 3¼ times that of 1850 (increase 227.7%); but in the final period of this series, from 1900 to 1950, the population did not quite double (increase, 98.3%). Table I presents also the population change decade by decade from 1900 to 1950, together with the population density expressed in terms of number of persons per square mile of territory. This figure increased only from 6.1 in 1800 to 7.9 in 1850, by reason of extensive acquisitions of unsettled territory; then, with little further change in area, to

25.6 in 1900 and 50.7 in 1950.

Current Estimates.—Monthly estimates of the population of the United States have been made since the 1940 census by adding each month the number of births, subtracting the number of deaths (with allowances for underregistration of births and deaths) and then adding the net civilian immigration into continental United States. The annual increase in the estimates for July 1 of each year between 1940 and 1945 ranged from 0.97% (in 1940-41) to 1.38% (in 1942-43) with slightly lower figures for the remaining years in the period.

For the period between 1945 and 1950 the annual increases averaged 1.63%, with a maximum of 1.94% in the year ending July 1, 1947.

The estimates for 1945, 1950, 1951 and 1952 are presented in Table II, with the births, deaths and net immigration on which the estimates are based. The table gives also the three types of estimates which are currently available, namely, total population, including armed forces overseas, civilian population and population residing in continental United States (the census population). The first of these is the most fundamental, reflecting as it does the complete results of the changes listed, but each of the other two estimates has its advantage for some special purpose.

Table II.—Estimated Total Population of the United States, Including Armed Forces Overseas

Item	July 1, 1952	July 1, 1951	July 1, 1950	July 1, 1945
Population	156,981,000	154,360,000	151,677,000	139,934,000
Increase during preceding year:				
Amount	2,621,000	2,683,000	2,528,000	1,538,000
Per cent	1.70	1.77	1.69	1.10
Factors in increase:				
Births*	3,835,000	3,761,000	3,686,000	2,955,000
Deaths*	1,503,000	1,484,000	1,467,000	1,636,000
Excess of births over deaths	2,332,000	2,277,000	2,219,000	1,319,000
Net civilian immigration	289,000	406,000	309,000	219,000
Civilian population	152,661,000†	151,082,000	150,196,000	127,571,000
Population residing in continental U.S.	155,152,000†	153,383,000	151,228,000	132,137,000

*Adjusted for underregistration.

†Estimate for April 1, 1952.

There is always wide interest in the prospects for the future, especially the near future, but population experts have been so much disturbed by the unexpected recent increase in population (notably the unexpectedly large numbers of births) that, after having insisted for 10 or 15 years that a stable population with no further increase was "just around the corner," they are reluctant to venture further forecasts. An official series does venture figures for dates up to 1960, under the conservative title "projections," which include the following (taking from the series of three sets of figures the one designated "medium"): for 1955, 163,186,000; for 1958, 168,132,000; and for 1960, 171,176,000. All of these projections represent the total population of the country including military overseas.

Births have contributed the major part of the increase in recent years, though net immigration amounted to 406,000 in 1951 and 289,000 in the year ending June 30, 1952.

Colour and Nativity.—In 1900 the foreign-born white population of the United States numbered more than 10,200,000 and formed 13.4% of the total. By 1910, following especially heavy immigration, the number had increased to 13,346,000, or 14.5% of the total, and there were further increases, in spite of the emigration of hundreds of thousands of foreign-born prior to World War I and the later restrictions on immigration, to 13,983,000 in 1930. During the decade 1930-40, however, there was little or no net immigration, and with a heavy mortality among the rapidly aging foreign-born the number had fallen in 1940 to 11,419,000, or 8.7% of the total population; and in 1950

TRENDS in the labour force, 1940 to 1952 (Source: U.S. Bureau of the Census)

Table III.—Population by Colour and Nativity, 1900 to 1950, with Urban and Rural for 1950

	Number	Total	White	Native	Foreign-born	Negro	Other races
1900	75,994,575	66,809,196	56,595,379	10,213,817	8,833,994	351,385

Rural-farm	100.0	86.7	83.3	2.4	13.7	0.8	

there were only 10,161,000 foreign-born white, forming 6.7% of the otherwise rapidly increasing population.

The Negro population, on the other hand, has formed a relatively stable percentage of the total population over a long period, ranging, in the 50 years ending in 1950, from 11.6 in 1900 to a minimum of 9.7 in 1930 and 10.0 in 1950. The increase from 1930 to 1950 was in part a reflection of the decline in the percentage foreign-born white, since the percentage native white increased during this period only from 78.4% to 82.8%, or 4.4 percentage points, while the foreign-born white decreased 4.7 points.

The census data on colour and nativity are summarized for the period from 1900 to 1950 in Table III, which gives figures also for urban and rural areas in 1950. In general, it may be said that the foreign-born whites were very largely in urban areas (where they formed 8.8% of the total, as compared with 2.4% in rural-farm areas) and that the Negroes, even after the extensive northward migration of the 1940s, were more numerous in rural-farm areas, where they formed 13.7% of the total population compared with 9.7% in urban and 8.0% in rural-nonfarm areas.

Sex Distribution.—In 1900 there were 1,638,321 more males than females in the population of the United States or, on a relative basis, 104.4 males per 100 females. The excess of males increased by more than 1,000,000 between 1900 and 1910, to a maximum of 106 males per 100 females, mainly as a result of the heavy immigration of that decade. By 1930, however, the excess of males had declined to about 1,500,000 and by 1940 to 453,909, there being only 100.7 males per 100 females. In 1950, as result of the lessening immigration (and the fact that such immigration as there was was largely female) and the tendency of women to live longer than men, the situation was reversed, and there were 1,031,883 more females than males in the census population, making a sex ratio of 98.6. About 400,000 of this excess resulted, however, from the fact that the persons in military service overseas, who were omitted from the regular census count which was classified by age and sex, were practically all males. The excess that would be closely comparable with 1940, then, was only about 600,000.

The sex ratio of the urban population in 1950, however, was only 94.6, representing an excess of females amounting to 2,684,122, while there was a substantial excess of males in the rural-nonfarm areas (543,369, or a ratio of 103.6) and especially in the rural-farm areas (1,108,870, or 110.1 per

100 females).

The population data classified by sex are summarized for the censuses from 1900 to 1950 in Table IV, which gives urban-rural data also for 1950.

Age Distribution.—The figures representing the age distribution of the population of the United States in 1950, which are presented in Table V, show clearly the effect of the relatively large numbers of births that had taken place in the years just preceding the cen-

sus. There were 16,163,581 children under 5 years of age, forming 10.7% of the total population, these being the survivors of approximately 17,750,000 births during the last 5 years of the census decade. In 1940, at the close of a period of very low birth rates, children under 5 numbered only 10,541,524 and formed only 8.0% of the total population; and higher quinquennial age groups, running up to 25-29 years, constituted larger percentages of the 1940 total, with a maximum of 9.4% in the group 15-19 years of age.

Table IV.—Population by Sex, 1900 to 1950, with Urban and Rural for 1950

Year	Total	Males	Females	Males per 100 females	Excess of males
1900	75,994,575	38,816,448	37,178,127	104.4	1,638,321
1910	91,972,266	47,332,277	44,639,989	106.0	2,692,288
1920	105,710,620	53,900,431	51,810,189	104.0	2,090,242
1930	122,775,046	62,137,080	60,637,966	102.5	1,499,114
1940	131,669,275	66,061,592	65,607,683	100.7	453,909
1950	150,697,361	74,833,239	75,864,122	98.6	1,031,883*
Urban	96,467,686	46,891,782	49,575,904	94.6	2,684,122*
Rural-nonfarm	31,181,325	15,862,847	15,318,478	103.6	543,369
Rural-farm	23,048,350	12,078,610	10,969,740	110.1	1,108,870

*Excess of females.

In 1950, however, the percentage of population under 5 years of age was decidedly higher than that representing any later group; the 5-9 year group formed a not-too-close second, with 8.8%; and the 25-29 year group (the survivors of the 15-19 year group of 1940) stood in third place with 8.1%. The proportion 65 years old and over of course showed some increase in 1950, in spite of the "pull" in the opposite direction by the young children, and registered 8.1%, compared with 6.9% in 1940.

The percentages of young children in the population were decidedly higher in the rural area than in the urban, especially in the rural-farm areas—except that the percentage of children under 5 years old was higher in the nonfarm rural areas than in the farm areas. The rural-nonfarm areas likewise registered a larger percentage of persons 65 years old and over (8.6) than either the urban (8.1) or the rural-farm (7.6). In most cases up to age 45, however, the rural-nonfarm percentage stood be-

Table V.—Population by Age, Urban and Rural: 1950

*Figures based on a 20% sample; enrolment in kindergarten excluded.

The percentages in school in 1950 ranged from 39.3 for children 5 and 6 years old to 95.7 for those 7 to 13 and 92.9 for ages 14 and 15, these groups including the major part of the elementary school enrolment. In the high school range, 74.4% of the boys and girls 16 and 17 years old were in school, and 32.2% of those 18 and 19 years old. The 1940 figures for single years of age indicate roughly the distribution within the marginal groups. The 43.0% of children 5–6 years old attending school in 1940 (including some kindergarten) was made up of 18.0% of the 5-year-olds and 69.1% of the 6-year-olds; all of the single years of age from 7 to 14, inclusive, carried percentages above 92 in 1940; for boys and girls above 14 the percentages were: for age 15, 87.6; for age 16, 76.2; for age 17, 60.9; for age 18, 36.4; and for age 19, 20.9. These percentages indicate more clearly than the broader age groups the gradual tapering off in school attendance with increasing age and the increasing tendency to seek full-time employment or to marry (26.4% of the females 19 years old in 1940 were married, and 17.3% of those 18 years old).

The urban-rural differentials in school attendance (or enrolment) were less marked than in many other classifications—and less marked in 1950 than in earlier census years. Throughout the age range covered by the table, the percentage of school attendance recorded for urban areas was higher than that in rural areas, especially for ages above 15. As between rural-nonfarm and rural-farm the differences were rather small—smaller than in 1940 or 1930.

Educational Attainment.—From 1870 to 1930 the population census schedule carried a question on literacy, defined as ability to read and write, though the emphasis was placed on illiteracy, the lack of this ability. During this period the percentage of the population 10 years old and over classified as illiterate declined from 20.0 to 4.3, with the figure falling below 1.2% for the entire population in several states and below 0.5% for the native white population in those states. A comparable figure for 1940 for the United

States was estimated at 2.9%. Since illiteracy, as then defined, had so nearly disappeared, it seemed wise in 1940 to adopt a new question which would provide some gradation in the degrees of literacy, as measured by the not altogether perfect index provided by the number of years the individual had spent in school. The question on extent of schooling was repeated in 1950, and the returns, for the population classified by colour, are summarized in Table VII.

The simplest figure which can be derived from this material is the median number of years of school completed, that is a (theoretical) number of years which would divide the whole series into two parts, one with more schooling and one with less than the median. This median was 8.4 years in 1940, 9.0 in accordance with a sample survey made in 1947 and 9.3 as computed from the 1950 census returns. The colour classification gives a median of 9.7 for the white population and 6.9 for the nonwhite.

Table VII shows not only the percentages reporting the various specific amounts of schooling, but also a column of cumulative percentages indicating the proportions of the population who had had "at least" the specified number of years in school. Thus the third figure in the total column indicates that 13.5% of the population had had at least one year of college; and the fifth figure indicates that 51.7% had completed at least one year of high school.

Foreign-Born White by Country of Birth.—The foreign-born white population, mainly of European origin, has for 100 years formed a considerable fraction of the population of the United States, increasing from 9.7% of the total in 1850 to a maximum of 14.5% in 1890, which was almost equalled by the 14.3% in 1910. While the absolute number of the foreign-born white increased a little, from 13,345,545 in 1910 to 13,983,405 in 1930, their percentage of the total decreased rather rapidly from the former date, being only 11.4 in 1930, 8.7 in 1940 and 6.7 in 1950. The foreign-born white population has formed at all times more than 98% of the total foreign-born.

Table VIII distributes the foreign-born white population of the United States by country of birth for the years 1910, 1930 and 1950. The nine countries which contributed (each) more than 4% of the total in 1950 were as follows: Italy, 14.0%; Canada, 9.7%; Germany, 9.7%; U.S.S.R., 8.8%; Poland, 8.5%; England and Wales, 5.8%; Republic of Ireland, 5.0%; Mexico, 4.4%; and Austria, 4.0%. These countries together contributed nearly 70% of the total. Canada, with 994,562, or 9.7%, and Mexico, with 450,562, or 4.4%, represented nearly all of the population from non-European countries.

Considerable changes have taken place in the distribution of the foreign-born white population by country of birth, the countries of the so-called older immigration showing smaller percentages in 1950 than in 1910, for example, and the countries

*Percentage having completed at least the number of years indicated; thus the number of persons having completed at least eight years of elementary school includes all those who have completed more than this.

of southern and eastern Europe, representing the "new" immigration, showing larger percentages of the total foreign-born white, though not always larger numbers, since the grand total was much smaller in 1950. The percentage from England and Wales, for example, declined from 7.2 in 1910 to 5.8 in 1950; the percentage from Norway and Sweden (combined) from 8.0 in 1910 to 5.2 in 1950; the percentage from Ireland (including Northern Ireland) from 10.1 in 1910 to 5.2 in 1950; and the percentage from Germany from 17.3 in 1910 to 9.7 in 1950 (partly as a result of repatriation of Germans prior to World War I). On the other hand the percentage of Italian-born in the foreign-born white population of the United States increased from 10.1 in 1910 to 14.0 in 1950, and the percentage of Greeks from 0.8 to 1.7.

Employment and Unemployment.—Estimates of the number of persons in the civilian labour force, the number unemployed, etc., have been published each month since 1940 on the basis of a sample survey covering about 25,000 representative households. For the purpose of these estimates a person who did any work for pay or profit during the week preceding the inquiry or who had a job from which he was only temporarily absent was counted as employed; and a person who was seeking work, using the term in a rather broad sense, was counted as unemployed. The employed and the unemployed, taken together, constituted the labour force. These figures are summarized for the months of Sept. 1951 and 1952, in Table IX, with the employed classified also by sex and as working in agriculture and in nonagricultural industries.

The civilian labour force increased by more than 500,000, from 63,186,000 in Sept. 1951 to 63,698,000 in Sept. 1952, the increase being only a little more than half the increase in the population 14 years old and over. The number of persons employed increased by 680,000, or 1.1%, while the number unemployed decreased by 168,000, or 10.5%. The number of unemployed in 1952 was only 1,438,000, or 2.3% of the labour force, which is close to an all-time minimum (except for some of the war years), representing largely persons in process of moving from one job to another. The most significant point brought out in the classification by sex and broad industry group was the increase of 942,000, or 5.5%, in female workers in non-agricultural industries, coupled perhaps with a decrease of 284,000 in the number of male workers in these industries, which

latter may be traceable to increases in the military services.

Table IX.—Employment Status of the Civilian Noninstitutional Population of the U.S.*

Employment status	Sept. 7-13, 1952	Sept. 2-8, 1951	Increase or decrease Amount	Per cent

Female	17,946,000	17,004,000	+942,000	+5.5

*Figures based on a small sample.

The changes in the several elements of the labour force for the entire period from 1940 to Sept. 1952 are presented in graphic form in the chart on page 152.

Vacant Dwelling Units.—Of the 46,012,917 dwelling units returned in the 1950 census, 3,156,932 were vacant, though only 731,282 of these were available for occupancy by families seeking to purchase or rent living quarters for permanent residence. An "available" unit is, by definition, one that is being offered for sale or rent—excluding those in such bad physical condition as to be classified as "dilapidated." Many of the remaining vacant units were seasonal dwellings, not suitable for year-round occupancy and in many cases held by the owners for summer occupancy, these being especially numerous in northern New England and other vacation areas.

The migration of families from farms and small towns into larger cities during recent years left many nonseasonal houses vacant in rural areas and accentuated the demand for housing in the large centres of population, though Table X, which summarizes the vacancy data for metropolitan areas and the remainder of the country, indicates that the percentage of vacant dwellings available for sale or rent was practically the same in these areas and outside.

Table X.—Vacant Dwelling Units Inside and Outside Metropolitan Areas: 1950

Subject	Total		In metropolitan areas		Outside metropolitan areas	
	Number	Per cent	Number	Per cent	Number	Per cent
All dwelling units	46,012,917	100.0	25,635,424	100.0	20,377,493	100.0
Vacant	3,156,932	6.9	1,110,361	4.3	2,046,571	10.0
Available	731,282	1.6	414,103	1.6	317,179	1.6
For rent	516,205	1.1	276,146	1.1	240,059	1.2
For sale only	215,077	0.5	137,957	0.5	77,120	0.4

Home Facilities.—One of the most significant of the tabulations of the housing census is that showing the number of home facilities, toilet, bathing, etc., in the dwelling units which house the population of the United States—especially as the second detailed census of housing, taken in 1950, makes possible comparisons with conditions ten years earlier. Figures are presented in Table XI for selected items from the list of home facilities covered by the questions on the housing census schedule.

In 1950, 30,614,000 homes, or 72.6% of the total, reported flush toilets inside the structure and for the exclusive use of the household, compared with 20,755,000, or 60.3%, in 1940. In addition 1,686,000 families in 1950 and 1,703,000 in 1940 (mainly in urban areas, where multifamily structures are common) reported flush toilets shared with other households. The percentage having flush toilets for exclusive use in urban areas in 1950 was 86.9, compared with 55.6 in rural-nonfarm areas and 28.8 in rural-farm areas.

The number of families having installed bathtub or shower for exclusive use in 1950 was 29,640,000, or 70.6% of the total, compared with 56.9% in 1940. Again the urban area showed a

*Figures based on a sample tabulation.

considerably higher percentage, namely, 83.7, with 54.6% for the rural-nonfarm area and 30.6% for the rural-farm. And likewise there were considerable numbers of installations, especially in urban places, which were shared by two or more households.

The percentage of families (occupied dwelling units) which reported mechanical refrigeration increased from 44.1 in 1940 to 80.0 in 1950, with an urban-rural differential somewhat less marked than that noted with respect to flush toilet and bathtub, the percentages being 86.5 for urban, 71.7 for rural-nonfarm and 60.9 for rural-farm. Ice refrigerators, the only other item of importance on this list, were most common in the farm areas, where they were reported by 14.9% of the families, and least important in urban areas, though even there they were reported by 9.1% of the families.

Radio distribution had reached the point, even in 1940, where 82.8% of the families had a radio set. This figure was increased to 95.6% in 1950, leaving only 4.4% of the families without a radio.

Television, on the other hand, came onto the market in quantity after 1940, so that the figure of 5,120,000 families (12.3% of the total) with television may be considered to measure the growth during the decade. The urban-rural distribution of the total percentage was as follows: urban, 15.8; rural-nonfarm, 6.8; and rural-farm, 3.0.

Electric lighting is perhaps the most significant of all the "facilities" listed in the census, especially since the current supplied for lighting is practically always available also for the operation of various items of household and farm equipment. The reports on electric lighting were tabulated for all dwelling units, including those vacant, rather than for occupied units alone. The numbers shown in Table XI are therefore a little too large to represent actual families or households having electric current available, but the percentages may be compared roughly with those shown for the other facilities. The percentage of all dwelling units having electric lighting increased from 78.7 in 1940 (already higher than the percentage for any other listed facility except radio) to 94.0 in 1950, again with relatively favourable showing for the rural-farm areas, which reported 77.7% with electricity, compared with 98.9% for urban areas.

Dwelling Units by Monthly Rental.—In Table XII the renter-occupied dwelling units in urban and rural-farm areas of the United States are classified according to monthly rent paid in 1950 and 1940. (Farm dwelling units are excluded from this table by reason of difficulty in separating either value or rental value of farm homes from the remainder of the farm property.) The median rental of nonfarm homes increased from \$21 in 1940 to \$35 in 1950, or by more than 66%, which is not far different from the increase in the cost of living—though one would have expected, as a result of the widespread rent control, that increase in rents would have fallen far short of the general increase.

Table XII.—*Monthly Rent of Urban and Rural-Nonfarm Renter-Occupied Dwelling Units in the United States*

	1950		1940	
Contract monthly rent	Number	Per cent	Number	Per cent
All renter-occupied dwelling units	17,098,000	—	16,334,937	—
Number reporting*	15,422,000	100.0	16,177,770	100.0
Under \$10	680,000	4.4	2,822,402	17.4
\$10 to \$14	580,000	3.8	2,279,797	14.1
\$15 to \$19	1,598,000	10.4	2,217,466	13.7
\$20 to \$29	3,070,000	19.9	3,852,730	23.8
\$30 to \$39	3,090,000	20.0	2,526,102	15.6
\$40 to \$49	2,540,000	16.5	1,300,080	8.0
\$50 to \$59	1,611,000	10.4	570,410	3.5
\$60 to \$74	1,122,000	7.3	326,662	2.0
\$75 to \$99	787,000	5.1	164,301	1.0
\$100 or more	343,000	2.2	117,820	0.7
Average rent	\$39	—	\$24	—
Median rent	\$35	—	\$21	—

*Excludes units occupied rent-free.

The figures for some of the specific rental classes are more significant, perhaps, than the median. Dwelling units renting for less than \$10 per month, for example, formed 17.4% of the total in 1940 but only 4.4% in 1950, while those with rent from \$10 to \$14 declined from 14.1% in 1940 to 3.8% in 1950. Conversely, units with rent between \$40 and \$49 formed 16.5% of the total in 1950, compared with 8.0% in 1940; and those with rent between \$50 and \$59 formed 10.4% in 1950 as against 3.5% in 1940.

There were corresponding increases in the reported value of owner-occupied homes (following a notable decrease between 1930 and 1940), but the 1950 tabulations are limited to single-family houses, whereas the earlier tables include estimated value of the owner-occupied part of larger structures, so that close comparison is not possible. Ceramic Products. The volume of manufacturing in the ceramic field continued on a high plane throughout 1952, despite some curtailment of production in the pottery and dinnerware fields. Peak markets were again the experience of the structural clay products, sanitary ware, structural glass, window glass, refractories and enamelled kitchenware and structural porcelain panels.

Shortages of strategic minerals continued to plague the industry. Copper and cobalt were virtually unobtainable. Substitutes were developed for them, but by the latter part of 1952 some manufacturers were beginning to obtain limited quantities of these metals.

New Developments, 1951-52.—A high-voltage bushing was developed for use at radio frequency. This bushing was designed to operate at 300,000 v. and 18 to 25 kc. Its over-all length was about 26 ft. and its weight was more than 6,000 lb. In order to keep capacitance and electrical losses at a low value, conventional type construction could not be used. Instead, the bushings were filled with gas under pressure.

Glass container production continued on a high plane. Flat glass stayed at a high volume, because of continued heavy building construction. (See also GLASS.)

The dinnerware and pottery industry was facing increased competition from foreign producers in addition to some competition from the plastics industry. Some manufacturers were concentrating on innovations in design and multiple unit replacement sets. One of the world's largest producers of dinnerware announced an addition to its industrial capacity.

There was continued heavy demand for refractory raw materials, and action was being taken to improve quality and alleviate shortages. The heavy media process had been applied to Austrian magnesite and Philippine chrome ore. The cyanite supply, especially that from India, was becoming shorter and prices were increasing. This stimulated the use of synthetic products. Depletion of diaspore deposits in Missouri was continuing at a rapid rate. Steps were taken to increase the supply of calcined South American bauxite for high alumina refractories. New sources of raw material were investigated and proven for silica brick. Higher quality refractories were in demand by the principal consumers in order to insure uninterrupted services of furnaces. A number of different refractories were used so that uniform life could be secured in all parts of the furnace, which also guarded against shutdowns and lower production rates. There was an increase in the use of castable and plastic refractories.

The magnesite industry set a record by producing more than 400,000 tons of dead-burned magnesite. The treatment of crude magnesite by flotation prior to dead-burning was resumed by Basic Refractories, who put a heavy media plant into service in order to separate brucite from gangue. In the synthetic field, there were no major changes. All producers improved the control of impurities in their products.

The Structural Clay Products institute announced a new brick, SCR Brick, which was said to possess design advantages making it competitive with frame construction.

The Porcelain Enamel institute was actively developing its curtain wall project. The use of colours in these wall panels promised to give them a favourable competitive position with glass and tile.

Enamelling on aluminum was rapidly assuming manufacturing importance in the porcelain enamel field. Extensive in-

SWEDISH CERAMICS (on table) and Dutch pewter ware (beneath table), popular with U.S. tourists in Europe in 1952. Ceramics shown include a Gustavsberg bowl (centre), Orrefors glass bottle and vase (left)

stallations where porcelain enamel formerly could not be used now became open because of the lighter weight advantage.

The lightweight aggregates, including expanded clay and shale aggregates, cinders, perlite, pumice, slag and vermiculite, continued to increase in importance and to expand into new uses and markets. Studies of the clays and shales of various geographic areas indicated additional sources of raw materials for making lightweight aggregates, and a considerable enlargement occurred in the body of technical information relating to the properties of clays and shales which cause bloating and to the technology of expanding them by more or less conventional procedure. Departing from the latter was a plant at Salisbury, N.C., which produced lightweight aggregate from clay, using the Dwight-Lloyd sintering process. The waste slimes from the washing of land pebble phosphate were suggested as a raw material for making lightweight aggregate by firing. (C. S. Pe.)

Ceylon. A self-governing member of the Commonwealth of Nations, Ceylon lies southeast of the most southerly point of India. Area: 25,332 sq.mi. Pop.: (1946 census) 6,657,339; (mid-1951 est.) 7,743,000. Language: mainly Sinhalese (69%) and Tamil (21%). Religion: Buddhist (61%), Hindu (22%), Moslem (9%) and Christian, mainly Roman Catholic (7%). Chief towns (pop., 1946 census): Colombo (cap., 362,000); Jaffna (63,000); Dehiwala-Mt. Lavinia (56,900); Kandy (51,200); Moratuwa (50,700). Governor general: Lord Soulbury; prime ministers (1952): Don Stephen Senanayake and (from March 26) Dudley Senanayake (q.v.).

History.—The death, following a riding accident, of Don Stephen Senanayake, independent Ceylon's first prime minister, occurred on March 22, 1952, and plunged the whole country into mourning. Three-quarters of a million people filed past the bier, and vast crowds attended the cremation in the centre of Colombo. After several days of uncertainty the premier's son, Dudley Senanayake, minister of agriculture in his father's government, was appointed prime minister. Parliament was dissolved in April and a general election was held in the following month. The omission from the voters' registers of large numbers of Indians, who had applied for Ceylonese citizenship but had not so far been accepted, drew a protest from the government of India; this was rejected and the controversy continued to smoulder throughout the year. The elections resulted in a decisive victory for the prime minister's United National party and in the weakening of Communist influence. A new government took office on June 2.

The International bank report, published in September, contained sharp criticism of government policy on the new state industries. Meanwhile Ceylon's financial position had worsened because of a contraction of revenue, and the severe pruning of voted expenditure was ordered. An adverse trade balance amounted to Rs. 67,000,000 for the first half of the year, compared with a favourable balance of Rs. 248,000,000 for the same period in 1951. To conserve dollars Ceylon imposed restrictions on certain classes of imports from the nonsterling area in September, two months before the prime minister went to London for the Commonwealth Economic conference.

The food situation caused acute anxiety during 1952. Because of Ceylon's inability to buy enough rice in Burma and Siam, the food minister, Sir Oliver Goonetilleke, was forced to ask help from the United Kingdom government in obtaining supplies from other sources. Following a visit to Washington, D.C., the food minister bought 40,000 tons of rice from the United States and the rice situation was thus made secure until early 1953. Great efforts were also made to increase domestic rice production.

Illicit immigration into Ceylon from India was an important police problem and the army was called in to assist in making arrests. In September a trade delegation led by R. G. Senanayake, minister of commerce, visited Peking to further Ceylon's policy, strongly criticized in the west, of trading with China. Imports from Japan increased substantially during the year. In February an Indo-Ceylonese trade agreement covering the year 1952 was signed in Colombo.

In March an event of great religious significance to Buddhists took place at Kandy: in the Temple of the Tooth, before a company that included 100 Burmese on a special pilgrimage from Rangoon, the sacred tooth relic was exposed. (Jo. Hn.)

Education.—Schools (1949): Sinhalese and Tamil government and assisted 5,610, pupils 1,010,184; central and English 631, pupils 237,678. Technical college (1949–50), students 1,969. Teacher's training colleges (1949) 20, students, primary 1,653, secondary 222, post graduate 68. University (1949–50), students 1,850.

Finance and Banking.—Budget: (1951–52 est.) revenue Rs. 896,000,000, expenditure Rs. 886,000,000; (1952–53 est.) revenue Rs. 904,000,000, expenditure Rs. 939,000,000. Gross national debt (Sept. 1950) Rs. 561,400,000. Currency circulation (Aug. 1952): Rs. 362,000,000. Bank deposits (July 1952) Rs. 554,000,000. *Monetary unit: rupee, with an exchange rate of Rs. 13.33 to the pound and Rs. 4.775 to the U.S. dollar.

Foreign Trade.—(1951) Imports Rs. 1,559,000,000, exports Rs. 1,904,000,000. Main sources of imports (1951): U.K. 22%; Burma 15%; India 12%; Australia 8%. Main destinations of domestic exports: U.K. 32%; U.S. 11%; Australia 7%; Canada 4%. Main imports: rice, cotton piece goods and sugar. Main exports: tea, rubber and coconut oil.

Transport and Communications.—Roads (1949): 6,535 mi. Licensed motor vehicles (Dec. 1950): cars 32,500; commercial 14,800. Railways (1949) 896 mi.; passengers (1949) 26,700,000; freight goods (1949–50) 1,350,000 metric tons. Air transport (1950): passenger-miles 6,152,000; cargo, ton-miles 73,000. Telephones (1951): 16,860. Radio receiving set licences (1950): 28,000.

Agriculture.—Main crops (metric tons): tea (1950) 138,900; rice, paddy (1951) 315,000; cassava (1950) 185,000; sweet potatoes and

yams (1950) 59,000; millet (1948) 10,000. Copra exports (1951) 36,900 metric tons. Livestock (Sept. 1951): cattle 1,072,000; sheep 51,000; pigs (1950) 104,000; buffaloes (1948) 658,000; goats (1950) 370,000. Coconut oil exports (1951) 111,500 metric tons.

Industry.—Fuel and power: manufactured gas (1951) 9,260,000 cu.m.; electricity (1951) 106,600,000 kw.hr. Raw materials (metric tons): rubber (1951) 108,000; graphite (exports, 1949) 12,434; salt (1949) 28,775.

Chapman, Oscar Littleton (1896–), U.S. secretary of the interior, was born on Oct. 22 in Omega, Va., and graduated from Randolph-Macon academy in Bedford, Va. He served in the navy in World War I and studied at the University of Denver, Colo., the University of New Mexico, Albuquerque, and at Westminster law school in Denver, where he received a law degree in 1929. He was chairman of the Colorado Child Welfare committee and later president of the Colorado state board of control. In May 1933 he was appointed assistant secretary of the interior. He was a member of President Franklin D. Roosevelt's so-called "little cabinet," and for a dozen years supervised at one time or another virtually all the interior department activities. In Dec. 1949 he became secretary of the interior. In Feb. 1951 he announced the resignation of the director of the national park service, Newton B. Drury, who had four years until retirement. Drury said Chapman forced him out; he had opposed Chapman's plan to build hydroelectric and irrigation dams in Dinosaur National monument in Utah and Colorado.

Chapman, a long-time friend of Adlai E. Stevenson, was reported to have sought the vice-presidential nomination during the Democratic convention in July 1952, but Stevenson chose Sen. John Sparkman (*q.v.*) as his running mate.

Chemistry. **Bond Lengths.**—It had long been known that the carbon-carbon distance in ethane is 1.55 angstrom units and in ethylene 1.32 Å. Just as benzene had been shown to be a true hexagon with bond lengths of 1.39 Å, so it had been assumed that naphthalene and anthracene would be composed of true hexagons. J. M. Robertson (England), however, demonstrated that significant deviations exist. He made very accurate measurements of C—C distances in these two hydrocarbons from electron density maps and triple Fourier analyses, with these findings. For naphthalene the bond distance of C₁—C₂ (also C₂—C₃ and C_{4a}—C_{8a}) is 1.395 Å; C₁—C_{8a}, 1.420 Å; C₇—C₈, 1.363 Å. It is particularly significant to compare C₁—C₂ with C₇—C₈ since these are equivalent positions in the two fused hexagons. For anthracene he found these values: C₁—C₂, 1.368 Å; C₇—C₈, 1.359 Å; C₈—C_{8a}, 1.424 Å; C_{8a}—C₉, 1.383 Å; C₉—C_{9a}, 1.393 Å; C_{9a}—C₁, 1.414 Å; C₆—C₇, 1.389 Å; C_{8a}—C_{10a}, 1.439 Å.

Ion Exchange Separation of Rare Metals.—F. H. Spedding, E. I. Fulmer and co-workers (Iowa State college, Ames, Ia.) developed an efficient scheme for separation of some of the difficultly separable rare earths, namely, by use of the high-capacity resin Nalcite HCR and 0.1% citrate solutions. Gram quantities of the elements holmium, erbium and dysprosium were obtained in this way.

The ion exchange resin Dowex-50 was used by L. B. Werner

and I. Perlman (University of California, Berkeley, Calif.) for the similar separation of americium from curium in the first isolation of curium. The latter metal was obtained in microgram quantity by neutron irradiation of americium. W. E. Brown and William Rieman III (Rutgers university, New Brunswick, N.J.) also reported the use of ion-exchange methods for the separation of titanium, zirconium and thorium.

Metal Hydrides.—H. I. Schlesinger and collaborators at The University of Chicago prepared hydrides of zinc and cadmium by interaction of dialkylzinc or dialkylcadmium with lithium aluminum hydride, LiAlH_4 , in ether. Zinc hydride, ZnH_2 , was found to be a white, nonvolatile solid. It turned gray in a day or two, presumably because of slight dissociation into the elements. Freshly prepared material did not react with air and reacted only slowly with water. It absorbed diborane to yield zinc borohydride, $\text{Zn}(\text{BH}_4)_2$.

Cadmium hydride was unstable, but at -78°C . it could be maintained. On warming to 2°C . it suddenly decomposed. Attempts to prepare beryllium and magnesium hydrides in this way were partly successful. The compounds were formed but the investigators were unable to remove all the ether (solvent) from the preparations.

Borazole.—In 1926 the German chemists A. Stock and E. Pohland allowed diborane and ammonia to interact. An adduct, $\text{B}_2\text{H}_6(\text{NH}_3)_2$, was formed at low temperature and it lost hydrogen at 180°C . to yield borazole, $\text{B}_3\text{N}_3\text{H}_6$. This substance was a colourless liquid boiling at 53°C . and melting at -58°C . The structure assigned was a six-membered ring like benzene, with B and N atoms alternating. For this reason, and because the physical properties somewhat resemble benzene, it was nicknamed "inorganic benzene." Chemically, however, there is no resemblance since water decomposes it with formation of boric acid, ammonia and hydrogen.

D. L. Coursen and J. L. Hoard (Cornell university, Ithaca, N.Y.) made careful X-ray diffraction measurements in 1952 of the bond lengths in B-trichloroborazole. Results proved that the B and N atoms were planar and that its molecular configuration closely resembled that of the benzene analog, sym-trichlorobenzene. The bond distances found were $\text{B}-\text{N}$ 1.41 Å and $\text{B}-\text{Cl}$ 1.76 Å. The bond angles were about 120° . R. L. Pease of Atomic Energy Research establishment, Harwell, Eng., also was active in this field.

Aluminum Chloride.—Claims and counterclaims had appeared in the past regarding possible interaction of dry hydrogen chloride and dry aluminum chloride. To settle this question, H. C. Brown and H. W. Pearsall (Wayne university, Detroit, Mich.) demonstrated nonreaction. Hence, the acid HAlCl_4 is nonexistent as such, although derivatives of it seem to be well authenticated.

Brown and Pearsall's work also showed that nothing happened between toluene and pure aluminum chloride at either -80°C . or 0°C . unless a trace of water was present; but at -80°C . with water present the aluminum chloride dissolved to give a brilliant green solution. One part of hydrogen chloride was taken up for each part of aluminum chloride dissolved. The green complex possessed the structure $(\text{CH}_3\text{C}_6\text{H}_5)^+ \text{AlCl}_4^-$. In other words, it was a carbonium salt of the hypothetical HAlCl_4 .

At -45°C . a yellow complex was formed, $(\text{CH}_3\text{C}_6\text{H}_5)^+ (\text{Al}_2\text{Cl}_7)^-$, involving two parts of aluminum chloride. The complexes which form in the course of Friedel-Crafts reactions are regarded as related. The investigators proposed that the high solubility of aluminum chloride in these complexes is due to further complexing, yielding substances with this general formula: $(\text{ArH}_2)^+ (\text{AlCl}_4 \cdot n\text{AlCl}_3)^-$, wherein ArH is an aromatic hydrocarbon. Also, they suggested that these complexes play

HIGH-PRESSURE STRUCTURE at the coal-hydrogenation plant opened by the Union Carbide & Carbon Corp. at Institute, W.Va., in 1952. It was the first commercial plant to use coal as a raw material for producing chemicals

an important role in most Friedel-Crafts reactions by supplying a highly polar medium in which the ionic intermediates may form and react.

Paraffin Adducts.—The inertness of paraffins is well known. It was surprising, therefore, when it was learned that they formed crystalline adducts with urea and thiourea. One of the most recent of the many investigations on this topic was that of R. W. Schiessler and D. Flitter of Pennsylvania State college, State College, Pa. They found that pentane or hexane did nothing, but that unbranched alkanes, heptane and above, readily formed crystalline complexes with urea at 25°C . Branching and terminal phenyl groups interfered with this addition, since 2,2,4-trimethylpentane, 7-methyltridecane, 3-ethyltetracosane and 1-phenyloctane failed to react. If the unbranched chain of an alkylbenzene was sufficiently long (as in 1-phenyl-eicosane) then addition did occur.

Thiourea was found even to add to many branched paraffins and cycloalkanes: neopentane, 3-ethyltetracosane, cyclopentane, cyclohexane, but not to others: 5-butylnonane, 3-methylheptane, 1-phenyloctane. They found that complexes will form if the cross-sectional dimensions of two of the three axes of the hydrocarbon is about $5.8 \times 6.8 \text{ Å}$.

D. Swern and W. S. Port (Eastern Regional Research laboratory, Wyndmoor, Pa.) employed urea complexes to recover vinyl palmitate (monomer) from partly polymerized material, and to separate vinyl pelargonate from cross-linking contaminants. The ingredients were mixed in methanol solution and the complex precipitated directly. To remove urea from the complex one only needed to add water and the urea dissolved.

Acetylenic Compounds in Nature.—In 1950 N. A. Sörensen (Sweden) found that polyacetylenic compounds were isolable from several genera of Compositae. Extending this work, Mar-

jorie Anchel (the New York Botanical Garden, New York, N.Y.) found that acetylenic compounds were also obtainable from fungi, from culture liquids of different species of Basidiomycetes. The presence of groupings such as $-C\equiv C-C\equiv C-C\equiv C-CH=CH-$ or $-C\equiv C-C\equiv C-C\equiv C-$ were strongly supported by ultra-violet absorption spectra and other evidence.

Soil Conditioners.—Much industrial interest was aroused in 1952 in the field of soil conditioning in view of the announcement, notably by Monsanto Chemical company, St. Louis, Mo., that small amounts of certain polymeric substances when mixed with a clay soil were capable of imparting structural strength and workability to the moist soil. Trade names such as Krilium, Merloam, Acrylon and Fluffium appeared. One of these products is the sodium salt of hydrolyzed polyacrylonitrile. Another is a modified vinyl acetate and maleic compound. In powder form 1 lb. of material is recommended to treat about 200 sq.ft. of soil. It seemed that this might be a growing area of agricultural chemistry.

Ring Contraction During Reduction.—The Clemmenson reduction of ketones by zinc amalgam and hydrochloric acid is an established way to replace the keto oxygen by hydrogen. An example is the conversion of acetophenone into ethylbenzene. N. J. Leonard and co-workers (University of Illinois, Urbana, Ill.) found remarkable peculiarities in this reaction. In heterocyclic ketones wherein the keto group is attached to a carbon atom holding a ring nitrogen or sulphur atom, Leonard found many examples where ring contraction occurred during reduction of the ketone under Clemmenson conditions. Thus, a seven-membered ring changed to six, and a six-membered to five. An eight-membered ring did not change to seven, but instead became acyclic. This example was the change of 1,2-dimethyl-1,2,3,4,5,6,7,8-octanone into N-methyloctylamine.

Dihydropyran.—This compound had become an industrially important chemical a few years before, stemming from its synthesis from tetrahydrofurfuryl alcohol by catalytic dehydrogenation over hot alumina.

Alkoxy derivatives of dihydropyran were prepared in 1952 by chemists (C. W. Smith, D. G. Norton, S. A. Ballard) at Shell Development Co., Emeryville, Calif., but the method did not use either dihydropyran itself or its precursor. Instead, vinyl ethers were added to acrolein by heating the mixture in a nickel-lined bomb at 185° C. for 1 hr. Alcohols and carboxylic acids add to the double bond of these compounds in the same manner as to dihydropyran.

Acrolein was found to add not only to vinyl ethers but also to styrene (at 155° C.), acrylic esters (180° C.) and isobutylene (220° C.). Six-membered O-heterocyclic compounds were formed from each. These new classes of compounds opened the way to many new synthetic operations.

Isonicotinic Acid.—Until 1952 this compound had no important uses. The acid is made by oxidizing a methylpyridine (gamma picoline) which occurs in coal-tar bases. An important new use appeared when it was discovered that toward test animals certain of its derivatives displayed antitubercular activity in vivo far in excess of any other known substance. Isonicotinic hydrazide was particularly effective. The acid itself was not active.

Search for this compound started with the finding by V. Chorine (France) in 1945 that nicotinamide showed some tuberculostatic activity whereas nicotinic acid did not. Although both the amide and the acid are active as vitamins it was apparent that the tuberculostatic activity must be independent of vitamin activity. H. H. Fox of Hoffmann-LaRoche, Inc., Nutley, N.J., prepared several related compounds containing the pyridine nucleus and had them tested. 3-Aminoisonicotinic acid was one

of these. Although its in vivo antitubercular activity was only half that of nicotinamide it was the first compound encountered which displayed activity in the isonicotinic series. The hydrazide mentioned above was tested in a logical extension of this work. In mouse infections it was effective at $\frac{1}{13}$ the dose required for streptomycin. Also it protected mice against tuberculosis in an unusually low dosage range (10 mg. per kilogram per day). In view of the encouraging preliminary work with humans, many pharmaceutical houses were engaged actively on the tuberculosis problem. Search was largely empirical and many closely related compounds were found to be ineffective. For example, although hydrazine and hydroxylamine are closely related substances, T. S. Gardner of Hoffmann-LaRoche showed that isonicotinohydroxamic acid showed no antitubercular activity.

Cortisone.—Interest in production of this steroid continued unabated. Merck's production, starting with deoxycholic acid from ox bile, was such that its price was lowered in 1952 to \$9.60 per gram wholesale. The Upjohn company, Kalamazoo, Mich., became an important contender for part of the cortisone market by discovering biochemical methods of oxygenating the important C-11 carbon of steroids. A patent for this process was issued to H. C. Murray and D. H. Peterson. Thus, the bio-oxidation of progesterone to 11 α -hydroxyprogesterone was accomplished with *Rhizopus arrhizus*. Moulds of the Mucorales order were used to promote oxidations at C-11 on other steroids.

Carl Djerassi, H. J. Reingold and G. Rosenkranz of Syntex, Mexico City, Mex., found that hecogenin was a steroid containing a keto group at C-12 which occurred in many of the *Agave* indigenous to Mexico, southwestern U.S. and east Africa. To transfer the keto group from C-12 to C-11 these chemists brominated the compound, hydrolyzed the product (an acyloin), then oxidized it to the 11,12 diketo structure with bismuth oxide, and preferentially reduced the last to the 11-keto compound, from which cortisone was obtained by established procedures.

Terramycin.—This broad spectrum antibiotic, prepared in culture broths of *Streptomyces rimosus*, was isolated in 1951 in pure form by a group of chemists at Chas. Pfizer & Co., Inc., Brooklyn, N.Y. It is a pale yellow solid melting with decomposition at 184° C. but the anhydrous material retains four-fifths of its antibiotic activity after six days at 105° C. It gives salts with both acids and bases, hence it is amphoteric.

With the pure substance available, work on its structure progressed rapidly with the result that the complete structure was announced in 1952. F. A. Hochstein, C. R. Stephens, L. H. Conover, P. P. Regna, R. Pasternack, K. J. Brunings (all of Pfizer) and R. B. Woodward (Harvard university, Cambridge, Mass.) was the team making the announcement. The methods used were degradation processes in both acid and alkaline solutions, caustic fusion, reduction, and distillation with zinc dust.

The structure assigned carries a naphthacene skeleton. Just as anthracene is composed of three linear fused benzene rings, naphthacene is composed of four. Attached at various positions to this ring system are amide, amine, phenolic, alcoholic and keto groups. It may be named 2,4a,5,7,12-pentahydroxy-1-dimethylamino-11-methyl-4,6-diketo-1,4,4a,12a,6,11,11a,12-octahydro-3-naphthacenecarbonamide and this structure is supported by these facts. For convenience, the four rings will be referred to as A,B,C,D. Ring A carries the amine group, and ring D at the other end is phenolic. One double bond is in A, one in B and three (aromatic) in D.

If terramycin is first reduced by zinc and acetic acid (essentially removing the amine group and the hydroxyl at 4a) and then is dry-distilled with zinc dust, naphthacene is obtained thereby proving the nature of the skeleton. Acid treatment causes dehydration at 11,11a and induces opening of the B ring

by breaking the 4a,5 bond (a β -diketone) to form "apoterramycin," containing a lactone structure which involves the enol at 5 and the 12-hydroxyl.

The structure is consistent also with the products of alkaline degradation. Only the D ring survives this treatment. The products formed (such as 5-hydroxy-4-carboxy-3-methylindanone-2-acetic acid [or "terracoic acid"] and 6-acetylsalicylic acid) contain a salicylic acid moiety which would be expected because of the 6-keto and 7-hydroxy groups in the structure of terramycin. To explain formation of these compounds it was assumed that salicylic acid carrying this substituent next to the acid group, $-\text{C}(\text{CH}_3)(\text{OH})-\text{CH}(\text{CHO})-\text{COOH}$, was an intermediate. The indanone ring of terracoic acid then resulted by an aldehyde condensation para to the phenolic group.

Complete proof of structure awaited synthesis but the essential accuracy seemed firmly entrenched with the existing evidence.

Model Penicillin Systems.—J. C. Sheehan and collaborators at Massachusetts Institute of Technology were active in synthesizing compounds containing the ring system found in penicillin. In the key step, phthalimidoacetyl chloride was made to interact under conditions of high dilution with 2-phenyl-2-thiazoline in the presence of triethylamine. Essentially, this was a means of fusing the β -lactam ring such as is present in penicillin to the thiazole nucleus.

Triethylamine was known to extract the elements of hydrogen chloride from substituted acetyl chlorides to give ketenes (as their dimers). Possibly phthalimidoacetyl chloride,

was thus converted into phthalimidoketene,

If so, it would then add directly to the $\text{C}=\text{N}$ double bond of the thiazoline.

Extending this plan, Sheehan found that succinimidoacetyl chloride could also be used. The product from this reaction, on treatment with dilute base, underwent hydrolysis to open the imide ring without disturbing the lactam ring. This gave rise to a side chain resembling those in natural penicillins. Next, the thiazoline nucleus was modified to hold dimethyl and carboxy groups. Except for the phenyl group which was necessarily present in this work the thiazoline nucleus now was identical to that in natural penicillin. This compound also condensed acceptably with succinimidoacetyl chloride.

Morphine.—In 1952 Marshall Gates of the University of Rochester, N. Y., announced the complete synthesis of morphine starting with naphthalene. From it, 2,6-naphthalenediol was prepared. One of the two hydroxy groups was protected by benzoylation, then attack at the other position by nitrous acid yielded 1-nitroso-6-benzoxo-2-naphthol from which yellow 6-benzoxo-1,2-naphthoquinone and eventually 6-benzoxo-1,2-dimethoxy-naphthalene were obtained. After removal of the benzoyl groups, repetition of the above steps yielded 1,2-dimethoxy-5,6-naphthoquinone. Ethyl cyanoacetate condensed at position 8 of this compound, thus inserting the 8-cyanomethyl group (after decarboxylation).

This compound was now heated with butadiene at 85° C. for two days to produce a phenanthraquinone from the naphthoquinone. Morphine had long been known to possess a hydrogenated tricyclic phenanthrene skeleton and this step of Diels-Alder addition created it. With phenanthrene numbering, the cyanomethyl group was at 4a and the two quinone groups at 9,10.

The next step involved hydrogenation of the quinone at 10, then ring closure of this group with the cyano group to form a cyclic amide. Reduction of the other quinone oxygen (at 9) was next achieved, following which the amide carbonyl was reduced to amine by lithium aluminum hydride and methylated on the nitrogen. The resulting base was the same as one obtained by hydrogenating β -dihydrothebaine (from thebaine), then methylating, tosylating and detosylating with hot collidine. This proved unequivocally that the attachment of the N-containing chain of morphine was at the 4a-phenanthrene position (the C-13 morphine position).

This racemic base was now separated into its optically active, dextrorotatory component. The double bond from the butadiene adduct was hydrogenated with aqueous sulphuric acid and partly demethylated (ether to phenol). The secondary alcohol group created by hydration of the double bond was now oxidized to ketone. The next step was bromination. This not only substituted at 4 because of the phenolic hydroxyl at position 1, but also formed a double bond (by substitution and elimination of HBr) next to the ketone group. Another change also happened which was welcome but most unexpected, namely, inversion of asymmetry at the C-14 position to align it stereochemically to morphine.

Three steps took this compound to codeine: hydrogenation, bromination with three parts of bromine (which step caused the ether-type ring closure between positions 1 and 12), and reduction with lithium aluminum hydride (keto to alcohol, and replacement of Br by H).

Hydrolysis of codeine to morphine would have been a stumbling block, since the usual means of cleavage of ethers such as by mineral acids tend to destroy the morphine molecule. In 1951, however, H. Rapoport (University of California, Berkeley) discovered that heating of codeine with pyridine hydrochloride at 220° C. gave rise to morphine, hence this completed the synthesis.

Amino Acids and Peptides.—Perhaps the most outstanding work in this field was that of F. Sanger (Cambridge university) who completed the problem of the structure of insulin. Two or three years earlier this problem would have been regarded as incapable of solution, but Sanger developed an approach which was simple, logical and convincing. As a result of this work, insulin appears to be composed of four long polypeptide chains, held together by the disulphide linkages of cystine. Two of these four chains are identical and have glycine end groups. The other two also are identical to each other and have a terminal phenylalanine residue. These end groups were protected and labelled by 2,4-dinitrophenyl groups, inserted by use of 2,4-dinitro-1-fluorobenzene and mild alkali. Then the disulphide linkages were broken and oxidized by performic acid (a peroxide) and the fragments were collected into acidic and basic fractions. The order of the amino acid constituents in the basic fraction was previously announced. The work during 1952 completed the task by studying the acidic fraction. It was broken up into dipeptides and tripeptides by controlled enzymatic hydrolysis, and in these the amino acid sequence was recognizable. Thus the entire arrangement of 21 amino acids in this fraction was established, the order of the last 10 units being valine, serine, alanine, cystine, cystine, glutamic acid (amide form), glutamic acid, valine, isoleucine and glycine.

Sanger's method was used by J. F. Carson (Western Regional Research laboratory, Albany, Calif.) in determining the nature of the free amino groups in the antibiotic "subtilin." These were lysine and two sulphur-containing acids, $\text{C}_4\text{H}_5\text{S}(\text{NH}_2)_2(\text{COOH})_2$ and $\text{C}_5\text{H}_8\text{S}(\text{NH}_2)_2(\text{COOH})_2$.

In the field of synthetic polypeptides, H. Leuchs discovered in 1906 a novel synthesis which had recently been used extensively. He converted the amino group of glycine to a urethan

by reaction with ethyl chloroformate, and then changed it into a cyclic acid anhydride, best called azasuccinic anhydride, by reaction with thionyl chloride. (The prefix aza tells that one of the CH_2 groups of succinic anhydride is replaced by NH .) Reaction with water converted the anhydride into the polypeptide related to glycine, as carbon dioxide was evolved. Occasional interest in this reaction was maintained between the years 1906 and 1939; then there was nothing for eight years until a brief communication by R. B. Woodward and C. H. Schram (Harvard university) appeared to rediscover this synthesis of polypeptides. The publicity which attended this communication served to precipitate a flood of papers on polypeptide syntheses, not only from universities but also from industrial laboratories. This interest may have stemmed from the possible film and fibre-forming properties of these synthetic polypeptides. The extent of this interest may be judged by listing some of the workers who reported on polypeptides from azasuccinic anhydrides in 1951-52: F. Wessely (Vienna), E. Katchalski (Rehovot, Israel), W. E. Hanby (Courtaulds Ltd., Maidenhead, Eng.), H. Tani (Japan), M. A. Stahmann (University of Wisconsin, Madison), A. C. Farthing (Imperial Chemical Industries, London), M. Frankel (Jerusalem), K. Hofmann (University of Pittsburgh, Pa.), H. W. Jones (Western Regional Research laboratory), W. W. Prichard (E. I. du Pont de Nemours & Co., Wilmington, Del.).

To produce polypeptides by the Leuchs method, amino acids themselves were necessary. C. D. Hurd, C. M. Buess and L. Bauer of Northwestern university, Evanston, Ill., discovered a new method, starting with malonic acid. This was converted to a derivative with hydroxylamine and rearranged. Polypeptides precipitated on heating aqueous solutions of the hydroxamic salts. Azasuccinic anhydrides were probably formed transiently. These polypeptides were insoluble in aqueous solutions but were partially or totally soluble in ethanol, formic acid, cresol, pyridine and dimethylformamide.

Protein studies were also numerous, and one of these will be mentioned. I. M. Klotz, R. K. Burkhard and J. M. Urquhart (Northwestern university) found that on the alkaline side (above pH of 7) human albumin reacts in a specific manner with para (but not ortho) dimethylaminoazobenzene-sulphonates, -carboxylates, -phosphonates or -arsonates. The method was spectrophotometric, involving a comparison of optical densities. The nitrogen of the dimethylamino group was involved in a linkage with the protein, and experiments with modified proteins suggested that the tyrosine residues in human albumin completed this link. A bond was formed also between the anionic (negative) end of the azo dye and the cationic sites of the protein. Since the para but not the ortho compounds were effective it was reasoned that the relative distances separating the dimethylamino and sulphonate groups could be regarded as a yardstick for measuring certain distances in the albumin molecule. Thus, some side chains from tyrosine residues must be 12 to 13 Å away from certain cationic locations. (See also BIO-CHEMISTRY; CHEMOTHERAPY; PHYSICS; VITAMINS AND NUTRITION.)

Chemotherapy. Probably the most important and interesting drugs introduced during 1952 were isonicotinyl hydrazine (isoniazid) and its close relatives, 1-isonicotinyl 2-isopropyl hydrazine (iproniazid) and isonicotinyl-glucosyl-hydrazine. The development of these isonicotinic acid hydrazides was stimulated by the demonstration that the sulfone drugs and tibione possessed therapeutic value in the treatment of tuberculosis and leprosy. Search for more active related compounds led to the isonicotinic hydrazides. In the test tube, these isonicotinic acid derivatives showed themselves to be sev-

eral times more potent in antituberculosis activity than p-aminosalicylic acid (PAS) and slightly more active than the streptomycins. One of the great advantages of the isonicotinic derivatives is that they may be administered orally. Clinically, preliminary results were impressive. However, the exact position of these drugs in the long-term treatment of tuberculosis remained to be determined. It was suggested that they should be reserved for alternative or concomitant use with the approximately effective antibiotics, streptomycin or dihydrostreptomycin.

A new antibiotic, erythromycin, derived from *Streptomyces erythreus*, was investigated through the joint efforts of the large pharmaceutical manufacturers. It is a broad-spectrum antibiotic active against both gram-positive and gram-negative bacteria and mycobacteria as well as the viruses of the psittacosis-lymphogranuloma venereum group. It also showed activity against the rickettsial diseases and amoebic dysentery. Staphylococci which had developed resistance to the effects of penicillin and the broad-spectrum antibiotics, aureomycin, terramycin and chloromycetin, proved susceptible to erythromycin. However, these organisms then developed resistance to erythromycin. The drug may be administered orally and its toxicity is apparently low.

Pleocidin, another new antibiotic, was isolated from the organism *Streptomyces lavendulae*. It was shown to be highly toxic on injection but may be valuable for topical application since it was less irritant than streptothricin.

Mycobacillin, a newly introduced antibiotic, showed extreme activity against the acid-fast bacilli, the causative organisms of leprosy and tuberculosis. It had not been tested adequately in the laboratory or clinic.

Several new and interesting penicillin salts were developed during 1952. The hydriodide of the diethylaminoethyl ester of penicillin G, known as neopenil, when administered by injection caused a significantly higher concentration of penicillin in the bronchial secretions and saliva than ordinary types of penicillin. Its chief field of application appeared to be in the treatment of penicillin-sensitive infections of the respiratory tract.

The dibenzyl-ethylene-diamine salt of penicillin G, known as bicillin, produced protracted blood levels of penicillin. When the drug was given orally, these blood levels persisted for 48 hours but when given by injection, effective blood concentrations of penicillin persisted for three weeks following administration of 1,250,000 units. This effect was approximately five times longer temporally than any previously used penicillin preparation. The drug was expected to be of particular value in the prevention of recurrent attacks of rheumatic fever and in the treatment and prophylaxis of venereal disease.

Fumagillin, an antibiotic extracted from *Aspergillus fumigatus*, showed definite activity against *Endamoeba histolytica*, the organism responsible for amoebic dysentery. This drug was still in the investigational stage in 1952 but appeared to be a promising new weapon for the treatment of acute amoebic dysentery.

During the year it became apparent that chloramphenicol (chloromycetin) was responsible for the development of aplastic anaemia in a very small number of cases treated with this antibiotic agent.

X-ray diffraction studies of the molecular structure of aureomycin and terramycin, two of the wide-spectrum antibiotics, disclosed that they were strikingly similar in chemical content and the shape and orientation of their molecules.

For the treatment of malaria, three drugs seemed to have gained ascendancy; amodiaquin, camoquin and chloroquine (aralen) were shown to be valuable suppressants. A single massive dose of these drugs rapidly terminated the acute attack of vivax malaria and produced a clinical cure in a majority of

patients with falciparum malaria. However, they did not prevent relapse. Primaquine was shown to be curative for vivax malaria. It was advised that this drug be utilized only after the patient had been removed from an area where malaria was endemic. Since primaquine was curative, it completely eliminated the malarial parasites from the blood stream of the patient. As immunity is not conferred by an attack of malaria, the patient would succumb once more if bitten by an infected mosquito.

In the hormone field, a new process for the manufacture of cortisone made its manufacture simpler and more economical. The method ingeniously employed mould fermentation to convert progesterone to 11-ketoprogesterone and thus materially shortened the number of steps necessary in the synthesis of cortisone. Other factors which lowered the costs of production were successful synthesis from various plentiful vegetable sources and better yields from the bile acid method. (See also CORTISONE, HYDROCORTISONE and CORTICOTROPIN.)

Trianisyl-chloro-ethylene, better known as "TACE," a new estrogenic material, was introduced commercially during the year. This product demonstrated several unique properties. When administered orally, it was apparently changed in the liver to a more active estrogen than the original compound. It also had the property of being stored in the fat depots of the body. Therefore, although administered orally, it had a prolonged action since it was released slowly from the fat depots. The drug apparently showed usefulness in the treatment of the menopause and inoperable cancer of the prostate.

Corticotropin (ACTH, adrenocorticotrophic hormone) was further purified by oxycellulose absorption techniques. This more purified ACTH was found to be three or four times more active on intramuscular injection than the cruder preparations. Several firms made this more active material available commercially. In general, it was supplied in a mixture with 20% gelatin; the latter prolongs the absorption period of ACTH and therefore secures longer lasting effects, thus limiting the necessary injections to but one or two a day.

An interesting development was the report by University of Rochester, N.Y., chemists that they had successfully completed the first total synthesis of morphine beginning with Schaeffer's acid. This represented an outstanding triumph of synthesis.

An enzyme, hyaluronidase, was reported as successful in averting further formation of kidney stones in patients who had suffered repeated attacks. It acted by clearing certain colloidal materials from the urine of these patients.

In cancer research, the Sloan-Kettering institute reported that injections of Egypt virus for temporarily halted the progress of lymphosarcoma and carcinoma of the colon. On microscopic study of the cancer tissues, it was evident that the cancer cells were harmed materially. Unfortunately when the patient developed immunity to the virus, cancer growth accelerated markedly.

A new drug for the treatment of osteoarthritis was added during the year in the form of butazolidin or phenylbutazone. It proved to be an effective analgesic, antipyretic and anti-inflammatory agent.

A new development in the treatment of Parkinson's disease was announced during 1952. Working with the tropine portion of the atropine molecule, chemists succeeded in linking to it the benzohydril portion of the antihistamine, diphenhydramine hydrochloride (benadryl) molecule. The new drug, known as tropine benzohydril ether methanesulfonate or MK-02, had a cumulative effect which gradually controlled the rigidity, tremors, spasm, cramps and salivation in patients with parkinsonism in approximately two-thirds of the tests.

For the treatment of high blood pressure, 1-hydrazinophthalazine hydrochloride (apresoline) and the hexamethonium drugs showed definite value. Their combined use, however, increased

the incidence of dangerous side effects and was considered advisable only following careful, closely observed trial.

In experimental animals, the alkyl nitroindoles showed themselves to be potent, oral, blood pressure-reducing drugs. They counteracted the effects of serotonin, a substance found in considerable concentration in the circulation of hypertensive patients.

A new anticholinergic drug, prantal, was introduced during 1952 for the treatment of peptic ulcers. It demonstrated curative effect and relieved pain within a period of days following inauguration of use.

In the investigation of radioactive isotopes, it was discovered that the beta-rays from strontium 90 were effective in the treatment of ocular conditions such as corneal ulcers, vernal conjunctivitis and tuberculosis of the outer portions of the eye.

Waste fission products of the atomic energy program were suggested as a means of sterilization of heat-sensitive drugs. The gamma-ray radiation from these products presumably might be utilized for cold sterilization of antibiotics, hormones, vitamins, enzymes, antibodies, plasma, other blood fractions, essential oils and surgical dressings.

Radioactive cobalt was found an effective means of irradiation of tumour masses. Disks of radioactive cobalt are held within a huge barrel of lead weighing approximately a ton. The walls of the barrel are approximately a foot thick and the opening at the bottom of the tube is guarded by eight inches of mercury. The gamma-rays emitted from this machine follow an extremely narrow beamlike path permitting intensive bombardment of small areas of tissues. The approximate penetrating power of the cobalt gamma-rays is about the same as that generated by a 3,000,000-v. X-ray machine. Canadian experimenters reported extremely gratifying results in the treatment of radio-sensitive cancer. Several centres in the United States began experimentation with similar devices.

Drug Production.—Production of drugs both from synthetic and natural sources increased in the United States during 1952. Penicillin production increased 25%, streptomycin, 75%, and dihydrostreptomycin, 300%, over the same period in 1951. The output of wide-spectrum antibiotics also was materially increased but the adverse reports concerned with the incidence of aplastic anaemia following use of chloromycetin affected all members of this group. It was expected that production and demand would fall during the latter half of 1952. (See also ALLERGY; BACTERIOLOGY; MEDICINE; SURGERY; VETERINARY MEDICINE; VITAMINS AND NUTRITION.) (P. L. W.)

Chemurgy. New industrial uses for farm-grown raw materials and the development of new crops for agriculture, which are the primary objectives of chemurgy, advanced on many fronts in the United States during 1952. While no noteworthy new discoveries were announced, expansion of markets previously opened took place on an important scale.

The rising demand for corncobs presented a characteristic example. Formerly corncobs were regarded as a worthless waste by-product of corn production. They had little value even for fertilizer. They attracted little consideration as an industrial raw material because the supplies were widely scattered, mostly on the farms where the corn was grown. A few uses were discovered for them before World War II, and the one processor who purchased them handled about 5,000 tons in 1939. The 1952 consumption was expected to reach 600,000 tons, with more than 25 processors collecting and grinding them over the north central states where corn production is heaviest.

About two-thirds of the cobs used industrially during the year went into the manufacture of furfural. Furfural, an amber-coloured liquid chemical, contributes to the manufacture of

nylon. Furfural also enters into the production of synthetic rubber, synthetic resins and medicinals, and is used in refining vegetable and petroleum oils.

The next largest industrial use for corncobs was provided by the electroplating and metal-stamping industries. There ground cobs remove rough spots and dirt, absorb residual plating solutions and polish finished products. Ground cobs applied by air-blast methods clean many fine mechanical parts in precision machines in the automotive, aeroplane and electric industries, and remove rough parts from moulded plastics.

Still other markets for ground corncobs were found in agriculture itself. More than 100,000 tons went for poultry litter and livestock bedding. Still other quantities were combined with blackstrap molasses for feeding beef cattle, or were applied as mulches for garden crops.

No chemurgic matter attracted greater public attention than the remarkable expansion of applications for chlorophyll extracts. Medical researchers observed first that chlorophyll proved highly effective in reducing unpleasant odours arising from body wounds. From this discovery other studies resulted in chlorophyll, the green colouring matter in plants, being included in formulas for breath and body deodorants, toothpaste, chewing gum and even in dog foods. Consumer sales of chlorophyll products were estimated to exceed \$150,000,000 for 1952.

Chlorophyll was obtained principally by extraction from alfalfa. Spinach and broccoli also were used as sources.

The disappearance of the chestnut tree, once the country's principal source of tanning extracts, led to extensive search for other economical domestic sources. One of the more hopeful prospects was the sweet-potatolike root of canaigre, a wild plant native to southwestern United States and Mexico. Following researches by the Eastern Regional Research laboratory of Wyndmoor, Pa., 68 postmen in eastern Pennsylvania were wearing pairs of shoes with one sole tanned by a canaigre process and the other by the usual tanning methods. It was expected that such tests would determine the relative quality of the canaigre extract.

The new chemurgic fibre made from zein, the protein element in corn, was announced two years earlier under the trade name of Vicara. During 1952 it appeared to have won general consumer acceptance in blends with other natural and synthetic fibres.

A new development in antibiotics during the year was their general adoption in livestock feeds. Experiments and practice confirmed the previous observations that antibiotic additions to feeds greatly hasten the growth of young animals. One company began large-scale production of a synthetic milk for pigs which, if found practical by farmers, might considerably increase the potentials of pork production. Pigs raised on this milk are taken from the sows shortly after birth. By thus shortening the mother's lactation period, breeding might yield three litters a year instead of two.

About 4,000 ac. of kenaf, a fibre plant, were expected to be harvested in Florida. The crop received governmental encouragement in view of kenaf's adaptability to the uses of jute for burlap, of which around 500,000 tons are imported annually.

The campaign to create domestic supplies of castor beans made considerable headway. The 1952 acreage probably exceeded 200,000, principally in Oklahoma, Texas, California and Arizona. New strains of seed proved highly productive and better adapted to newly developed harvesting machinery. Uncertain foreign supplies and a rapidly growing industrial demand for castor bean oil in many forms had established the urgency for sources in United States agriculture.

Cherries: see FRUIT.

Chess. Larry Evans, a student at the City College of New York, retained the United States open chess championship at Tampa, Fla., in July 1952, finishing the tournament with a score of 10-2 after winning eight games and drawing four. Arturito Pomar of Madrid, Spain, was the runner-up. He went through undefeated for a final tally of 9½-2½.

Mrs. Mary Bain, New York, N.Y., kept her national women's open laurels and Evans and Donald Byrne, New York, N.Y., were co-champions in national speed competition. Curt Brasket, Tracy, Minn., won the United States junior title at Omaha, Neb., with Ross Siems, Toronto, Can., second. James T. Sherwin, Columbia university star, lost his New York state title in August, that prize being captured by Jack Collins, Brooklyn.

World team matches among 25 nations at Helsinki, Fin., featured international competitions, and the U.S.S.R. carried off the Hamilton-Russell trophy, symbolic of world supremacy, with a score of 21-11. Argentina was runner-up with 19½-12½. Then followed Yugoslavia, Czechoslovakia, the United States, Hungary, Sweden, the Federal Republic of Germany and Finland in the title division. The soviet team was comprised of Alexander Kotov, captain; Paul Keres, V. Smyslov, D. Bronstein, E. Geller and I. Boleslavsky.

The Hollywood invitation tourney at Los Angeles, Calif., in May attracted masters of several countries. Svetozar Gligoric of Yugoslavia came through as winner with 7½-1½ after winning six games and drawing three. Pomar was second and Herman Steiner, Los Angeles, Calif., was third. Gligoric earlier had triumphed at the Hastings Chess congress gathering in England in January, where he finished unbeaten with a tally of 7½-1½. D. A. Yanofsky, Canada; took the second prize with 6-3. Keres won the championship of the Soviet Union and added to his trophies with a victory at Budapest in April. Kotov led a big field of masters in the world zonal tournament in Sweden in October with a score of 16½-13½ after going through undefeated. T. Petrosian, also Russian, was second.

THREE-DIMENSIONAL CHESS demonstrated by E. G. Kogbetliantz, professor of mathematics at the New School for Social Research, New York city, where Kogbetliantz also taught a course in the three-dimensional game in 1952

Miguel Najdorf of Buenos Aires, Arg., and Samuel Reshevsky of New York, N.Y., tied for first in an international tourney that drew 23 masters to the Capablanca Chess club in Havana, Cuba. The two top players scored 18½-3½. Gligoric finished third with 17-5. Reshevsky and Najdorf later met in a match for what was called the "championship of the non-Communist world" and play was held in New York city, Mexico City and San Salvador. Reshevsky triumphed 11-7 after gaining a 7-1 lead in their New York series at the Manhattan Chess club.

(T. V. H.)

Chiang Kai-shek (1887-), virtual ruler of China for more than two decades before the National government was driven to Taiwan (Formosa) in 1949 by the Communists, resumed the presidency in 1950 about a year after he retired from his office to enable Vice-President Li Tsung-jen to negotiate a peace with the Communists early in 1949. In 1952 Chiang became a symbol of anticommunism, just as he was a symbol of China's resistance against Japanese aggression during 1937-45. In a press interview on July 4, Chiang stated that the Chinese Communists were irrevocably committed to loyalty to Moscow or they would never have gone into Korea. As in China's long history no tyrant remained in power long, Chiang believed that when the forces of his government eventually established beachheads on the mainland, the Chinese people would rise up to join him to overthrow the Communist rule. Furthermore, he declared that the national government would not, with the support of friendly free peoples, permit the Communist regime to be permanent.

In May Chiang stated that his government, if and when it returned to the mainland, would recognize the Communist redistribution of land.

After the ousting of Li Tsung-jen, Chiang controlled the national government practically without opposition. When Lieut. Gen. P. T. Mow, formerly Chiang's trusted aide and Chinese air force representative in Washington, D.C., defied Chiang's order to return to Formosa early in 1952 and denounced Chiang as unconstitutional head of the government, it was reported that Chiang was upset over the matter. Having been schooled in Confucian ethics as a boy and having become a Christian after rising to prominence, Chiang had always stressed the importance of faith, loyalty, devotion and a sacrificial spirit in life. (See also CHINA.)

(H. T. CH.)

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., Chicago lies at the southwest corner of Lake Michigan. Its population in the 1950 census was 3,620,962, an increase of 6.6% over the 1940 population. For the six-county Chicago metropolitan area, the census for 1950 showed 5,495,364, a 13.9% increase. The mayor in 1952 was Martin H. Kennelly.

Employment rose to an all-time high and unemployment dropped to a low level during the year. Production for defense purposes expanded, partly through a shift from manufacture of civilian goods and partly through the use of new facilities and additions to the labour force.

Bank clearings for the first nine months of 1952 declined 1.0% to \$33,093,761,000 from \$33,405,760,000 in the same period of 1951. New investment in industrial plants for the first nine months of 1952 amounted to \$167,253,000 compared with \$266,378,000 for the same period of 1951.

Because of the nation-wide steel strike in June and July, it appeared that industrial production in the Chicago metropolitan area in 1952 would not come up to the 1951 peak, which was in excess of \$17,000,000,000. Steel production in the Chicago metropolitan area, second only to that of Pittsburgh, Pa., amounted to 11,015,300 net tons in the first nine months of 1952. In the

same period in 1951, Chicago area steel mills produced 14,147,300 net tons. As a result of the steel strike, the year's total would not come close to breaking the 1951 record of nearly 19,000,000 net tons.

Retail sales in 1952 were estimated at \$4,800,000,000, the same figure as was recorded in 1951. Chicago continued to be the world's largest centre of rail and air traffic.

Passengers carried on the lines of the Chicago Transit authority continued to decline. The total number carried in the first eight months of 1952 was 451,264,286, a decline of 9.6% from 498,205,829 passengers carried in the same period of 1951.

All types of construction contracts awarded in the first eight months of 1952 involved an outlay of \$346,161,000, a decline of 7.1% from the first eight months of 1951, when similar expenditures amounted to \$372,855,000.

In the first nine months of 1952, permits for the building of individual homes in Chicago totalled 5,378; in suburban towns, 13,830; and in unincorporated areas, 3,983—a total of 23,191. At the same time, 2,792 apartment units were constructed within the city limits, 791 apartment units in the suburbs and 12 apartment units in unincorporated areas, for a grand total of 26,786 dwelling units in the period.

The total public assistance burden in Cook county for the first eight months of 1952 approximated \$46,908,568, with an average of 132,104 persons on relief rolls throughout the year. The average monthly allowance per person obtaining some form of assistance in Cook county was down to \$44.39.

The 1952 total budgets of the six governments that cover Chicago in whole or in part follow: city of Chicago, \$326,502,975; Cook county, \$72,183,779; Cook county forest preserve, \$5,596,192; Chicago board of education, \$274,838,905; Chicago sanitary district, \$29,281,347; and the Chicago park district, \$40,487,805.

The Republican and Democratic parties both held their national conventions in Chicago in 1952.

(L. LN.)

Child Labour. United States.—According to estimates of the bureau of the census, an average of nearly 2,500,000 youth 14 through 17 years of age were employed in the 12-month period ending June 1952. Of these, 822,000 were 14 or 15 years of age, of whom about 85% were in school and working outside school hours; 1,616,000 were 16 or 17 years old, 60% of whom were also attending school.

The necessity for conserving manpower had stimulated interest in standards for employment of young people, in their need for education and in problems of school dropouts. The U.S. department of labour, with the aid of its Advisory Committee on Young Workers and suggestions from the Committee on Manpower Policy of the Office of Defense Mobilization, issued a national policy on employment of school-age youth. This policy emphasized the importance of education, guidance, job supervision and training as a basis for encouraging all youth to develop fully their abilities. The Interdepartmental Committee on Children and Youth, representative of the government, issued a report "Youth—The Nation's Richest Resource," which described ways in which youth are helped to secure the kind of education and employment opportunities that prepare them for adult responsibilities. A bureau of labour standards bulletin, "After Teen-Agers Quit School," describing selected community programs which help young people with their vocational adjustments, was issued for use by counsellors and others concerned with the problem of high-school dropouts. In most states there were joint arrangements between high schools and the local offices of the state employment service co-operating with the bureau of employment security to provide vocational guidance. It was estimated that about 300,000 high-school graduates and

dropouts for the school year 1951-52 were tested and counselled or placed by local public employment services.

Advances in protecting the welfare of children employed in agriculture were stimulated by administration of the strengthened child-labour provisions of the federal Fair Labor Standards act which established a minimum age of 16 for work during school hours on farms where the products go into interstate commerce. Both government agencies and private organizations were active in spreading understanding of this provision, particularly as it applied to children of migratory agricultural workers. A subcommittee of the senate committee on labour and public welfare held extensive hearings on the report of the president's Commission on Migratory Farm Labor and recommended remedial legislation.

Very little child labour or school-attendance legislation was enacted in 1952. Kentucky amended its law to provide that children 14 and 15 years of age may work during regular school hours if the school authorities make arrangements for them to attend school at other hours. The amendment further provides that minors between 16 and 18 years of age may be employed in certain hazardous occupations under a written apprenticeship agreement approved by the State Apprenticeship council. Kentucky also extended its minimum school term from seven to nine months. A Massachusetts act extended until July 1, 1953, the authority of the commissioner of labour and industries to suspend any provision regulating the employment of women and minors, in the event of an emergency, or a condition of hardship in an industry or establishment.

Great Britain.—As of May 1951, 1,363,000 persons 15 through 17 years of age and 849,000 18- and 19-year-olds were employed. These two groups of young workers made up about 11% of the total labour force. The Youth Employment service made special efforts to help youth leaving school get the right training, find the right job and make good vocational adjustments.

Growing interest of employers in education of their young workers was indicated by an increase of about 10% in 1951 in the number released to attend classes held during working hours, compared with 1949-50.

As in prior years, temporary aid of older pupils in school was needed in the harvesting of agricultural crops. A memorandum sent by the ministry of education to local education authorities in April 1952 specified the minimum wages which should be paid to such workers and pointed out the desirability of good supervision.

Other Countries.—At its general session in Geneva, Switz., June 1952, the International Labour conference adopted a resolution concerning employment of young persons underground in coal mines. This resolution embodied standards as to minimum age, medical examinations, vocational training and guidance, night work and inspection services, and proposed further study by the Coal Mines committee of social welfare developments affecting these workers.

Another resolution recommended that the specific question of minimum age for admission to work underground in coal mines be placed on the agenda of the 1953 conference for second discussion.

Guatemala ratified four I.L.O. conventions affecting employment of persons under 18 years of age in industrial or in non-industrial occupations: no. 77 and 78 requiring medical examinations and no. 79 and 90 prohibiting night work. Cuba also ratified convention no. 90.

(E. S. J.)

Children's Books. With nearly 1,000 new children's books published in the United States in 1952, the task of selection proved challenging. Generally the books

were gay with colour, sparkling with wit and humour, imaginative and satisfying both from the standpoint of information and leisure-time enjoyment. Numerous new publisher's series as: *The First Book of—* (Watts), *Science Fiction* (Winston), *American Heritage* (Aladdin), *Makers of America* (Abingdon) and *Signature Books* (Grosset) joined already established series.

In picture books, *Puss in Boots*, newly illustrated and translated by Marcia Brown, proved delightful; alphabet books, as *A for the Ark* by Roger Duvoisin and *Ape in a Cape* by Fritz Eichenberg produced chuckles. Several well-known author-illustrators had new books, as Robert McCloskey with *One Morning in Maine*, Françoise Seignobosc with *Small-Trot* and H. A. Rey with *Curious George Rides a Bike*; the Caldecott award winner, Nicolas Mordvinoff, illustrated a cowboy story *Even Steven* (by William Lipkind) and Virginia Burton's *Maybelle the Cable Car* was entrancing and nostalgic. *Five Little Monkeys* introduced a new artist, Juliet Kepes, and the famous English cartoonist Rowland Emmet immortalized a rusty old railroad engine in *New World for Nellie*.

A little book which amused adults was *A Hole is to Dig* by Ruth Krauss, illustrated by Maurice Sendak.

Fantasy was of high calibre; two dragon stories appeared, one, *The Wonderful Adventures of Ting Ling* by Vernon Bowen, the other, *Richard Brown and the Dragon* by Robert Bright being inspired by a Mark Twain anecdote. A pig (Wilbur) and a spider were the heroes of *Charlotte's Web* by the inimitable E. B. White; nonsense and originality characterized *The Shouting Duke* by John Reese and *The Magic Currant Bun* by John Symonds. *Dr. Dolittle's Puddleby Adventures* (Hugh Lofting) and *Mary Poppins in the Park* (Pamela Travers) continued the adventures of old favourites.

Babette Deutsch and Avrahm Yarmolinsky collected ten stories of central Asia in their *Tales of Faraway Folk*. American humour of the tall tale variety, was found in Le Grand Henderson's *When the Mississippi Was Wild* (Mike Fink), Anne Malcolmson and D. J. McCormick's *Mister Stormalong* and Ray Wood's collected *Fun in American Folk Rhymes*. Traditional literature was enriched by Dorothy Hosford's *Thunder of the Gods* (Norse myths), by Olivia Coolidge's *The Trojan War* and by Barbara Picard's the *Odyssey* of Homer.

Among books for the eight- and nine-year-olds were *The Bears on Hemlock Mountain* by Alice Dalgliesh, Clyde Bulla's *Johnny Hong of Chinatown* and Maria Leach's *The Turn-Spit Dog*. *Henry and Beezus* by Beverly Cleary continued the anecdotes of Henry Huggins, and two new heroes were introduced in *That Boy Johnny!* by Evelyn Sickels and *Billy Had a System* by Marion Holland. Animal stories for this age were popular, especially Emma Brock's *Kristie's Buttercup* (calf) and *Come, Chucky, Come* (woodchuck) by Dorothea Snow, while Ruthven Todd's *Space Cat* was a hilarious account of a stratosphere adventure.

The D'Aulaires gave young readers an exciting, profusely illustrated biography of *Buffalo Bill*, Margaret Bell introduced *Kit Carson, Mountain Man* and Ronald Syme wrote dramatically of *Columbus, Finder of the New World*. An interest in nature was met with Harriet Huntington's *Let's Go to the Brook*, Herbert Zim wrote fascinatingly of *Alligators and Crocodiles* and *Lightning and Thunder*, and Herman and Nina Schneider produced a scientifically sound picture book, *Follow the Sunset*, while conservation was the theme of Irma Webber's *Thanks to Trees*. A simple physiology book for the six- to ten-year-old was *What's Inside of Me?* by Herbert Zim. Two appealing stories of other lands were *Elle Kari* (Lapland) by Elly Jannes and illustrated by Anna Riwkin-Brick and *Maui's Summer* (Hawaiian Islands) by Arnold Bare.

Girls of ten to twelve became interested in *Dogs in the Family*,

CHILDREN'S ILLUSTRATIONS for stories by Hans Christian Andersen, painted by students of New York city schools in 1952. Left: the jail scene from "The Tinder Box," by Gail, aged 11; right: illustration for "The Steadfast Tin Soldier," by Barbara, aged 13

a kennel operation story by Florence Musgrave, in *Crissy at the Wheel*, about the early days of automobiling, by Mildred Lawrence, and in *Tomboy Row*, another Rowena Carey story, by Ruth Holberg. Stories with a foreign setting varied from *Treasure Trove of the Sun* by Mikhail Prishvin and Ann Weil's *Red Sails to Capri*, to the English story *Picture Come True* by Priscilla Warner. For younger readers there was Ann Clark's *Looking-for-Something* (Ecuador) and *The Vanilla Village* (Mexico) of Priscilla Carden, while *Boy with a Harpoon* (Alaska) by the anthropologist William Lipkind and the poignant *Twenty and Ten; as Told by Janet Joly* (France, World War II) by Claire Bishop proved satisfying to the older reader. The foreign born, adjusting to America, were understandingly portrayed in *Joe-Pole, New American* (a D.P.) by Florence Hayes, in *Everybody's Island* (Puerto Ricans in New York city) by Amy Lillie and in *Zuska of the Burning Hills* (Czechoslovaks in West Virginia) by Alvena Seckar.

Several books concerned boys and baseball, one being *Monkey Shines* by Earl Miers; an amusing tale was *The Boy Who Stole the Elephant* by Julilly Kohler; Leon Wilson continued his saga of Cody Capshaw in *This Boy Cody and His Friends* and Elizabeth Yates wrote sympathetically of a boy growing up, in *Place for Peter*.

Historical stories were varied—15th-century England was *The Song of the Thrush* by Katherine Eyre, the Battle of Santa Cruz (17th century) was the theme of *Blow the Man Down* by Elfrida Vipont Foulds while the time of Henry VIII was *The Armourer's House* by Rosemary Sutcliff. *The Wilderness River* of M. I. Ross concerned the Hudson's Bay company, *The Fish Hawk's Nest* of Stephen Meader was about

smugglers, *The Golden Trail* by Margery Evernden was of the founding of San Francisco, Helen Fernald wrote of Kansas in *Plow the Dew Under* and *Joel; a Novel of Young America* by Nora Benjamin concerned the American revolution from the standpoint of a Jewish boy. *Jareb* by Miriam Powell was laid in Georgia, *Thunderbird Pass* by Adrienne Jones was in the high Sierras and Wyoming served as a background for the mystery *Rim-Rocked* by E. D. Myatt. Two horse stories were *Pat's Harmony* by Page Cooper and *The Lonesome Sorrel* by Keith Robertson.

Older girls enjoyed reading about a girl stowaway in *Where Away?* by Anne Molloy; the War of 1812 and young romance featured in *Candle in the Night* by Elizabeth Howard Mizner; character development was evident in *The Wind Blows Free* (Texas Panhandle) by Loula Erdman; the daughter of Jairus was the heroine of *Tamar* by Gladys Malvern, and *Slipper under Glass* by J. A. L. Hyndham concerned the disciplines of ballet training.

Notable biographies for mature readers were *Ralph J. Bunche: Fighter for Peace* by J. Alvin Kugelmass, *Leonardo da Vinci* by Elizabeth Ripley and *Thomas Jefferson; Champion of the People* by Clara Judson. An absorbing account of the Barents expedition was the translation of Kurt Schmeltzer's *The Long Arctic Night*. Varied interests were represented by Jean Slaughter's *Horsemanship for Beginners*, Jeanette Zarchy's *Sewing*, Herman and Nina Schneider's *Rocks, Rivers and the Changing Earth* and *Magic* by Alexander van Rensselaer. A new anthology of poetry was Louis Untermeyer's *The Magic Circle. The Story of India* by Jean Bothwell and *Made in Mexico* by Patricia Ross also proved interesting.

A Garden We Planted Together was an account of the United Nations, intended for primary grades, while *A Fair World for All* was a graphic treatment of the Declaration of

Human Rights, for older children, by Dorothea Fisher, Love of the out-of-doors was evident in Harry Zarchy's *Let's Fish*; Rutherford Montgomery told of *Wapiti, the Elk*; John and Jean George observed the ways of *Meph, the Pet Skunk*; and *Burglar in the Treetops* by George Heinold was a wryly humorous reporting of the ways of common wild animals.

Teachers and librarians found Winifred Ward's *Stories to Dramatize* helpful, also Eloise Ramsey's bibliography, *Folklore for Children and Young People*. The true Christmas spirit was best represented in Frances Frost's adaptation of Menotti's opera *Amahl and the Night Visitors*. (See also BOOK PUBLISHING; LITERARY PRIZES.) (E. A. Gs.)

Great Britain.—Important contributions to the bibliography of children's literature were the Library association's *Books for Young People . . . Under Eleven*, edited by Hilda M. McGill and the British Council's *20th Century Children's Books*, a concise, illustrated survey by Frank Eyre.

Boys enjoyed several convincing scientific fantasies, including *The Death of Metal* by Donald Suddaby; *Dark Atlantis* by David Craigie; *The Perilous Descent* by Bruce Carter and *Lode-star* by Franklyn M. Branley. African boyhood was described in *Ambari* by R. Forbes-Watson and Australian boyhood in *Turkey* by Ray Harris; British police work in *Bill Brown, C.I.D.* by Alan Brock and pranks of village lads in *Our Exploits at West Poley* by the novelist Thomas Hardy, published for the first time in England in book form.

Vivid portrayal of character and incident recreated the past in several stories, including *Redcap Runs Away* by Rhoda Power and *Brother Dusty-Feet* by Rosemary Sutcliff (14th- and 16th-century England respectively). *The Gentle Falcon* by Lorna Lewis, portrayed the child queen of Richard II. Ancient Athens was depicted in *The Crown of Violet* by Geoffrey Trease. *Eagle's Glen* by E. W. Betenson, *The Golden Quest* by Frank Crisp and *Young Harry Tremayne* by Roland Pertwee were forceful adventure stories in period settings.

Companions of Fortune, a boys' story by René Guillot, and *The Wonderful Farm*, an animal fantasy by Marcel Aymé, were finely imaginative translations from the French.

The Fairy Caravan, by Beatrix Potter, published in America in 1929, appeared in its first general edition in England. Children fond of fantasy also read *Mary Poppins in the Park*, by P. L. Travers; *The Borrowers*, by Mary Norton; *Wanderlust: Voyage of a Little White Monkey*, by Richard Armstrong and *The Voyage of the Dawn Treader*, an allegory by C. S. Lewis.

Talented picture stories included *Orlando: a Seaside Holiday* and *Manda* by Kathleen Hale, *The Little Horse Bus* by Graham Greene, and Rowland Emmet's whimsical *Nellie Comes Home*.

Girls appreciated *Barbie*, a perceptive study of a young musician by Kitty Barne, and the topicality of Pamela Brown's *The Television Twins*.

There was fun and adventure in *The Hop Dog* by Nora Lavrin and Molly Thorp, good narrative in *Hidden in a Dream* by Monica Edwards and a glimpse of stage school in *On Stage, Please* by Joan Selby-Lowndes.

The Boy at the Swinging Lantern was an Irish story of originality by Patricia Lynch and *Smoky Joe* by Laurence Meynell an amusing cat study.

The Ballad of the Kon-Tiki and *Belinda and the Swans* by Ian Serrailier and *The Blackbird in the Lilac* by James Reeve and Edward Ardizzone were notable contributions to children's poetry. Eve Garnett illustrated her verse anthology *A Book of the Seasons*.

Informative books included *The Story of the Book* by Agnes Allen; *Alice in Music-Land* by Ernest La Prade and *Exploring Old Buildings* by Evelyn V. Clark. Biographical works were numerous but not always successful. They ranged from studies of

scientists in Egon Larsen's *Men Who Have Changed the World* and Laurence Meynell's *Builder and Dreamer* (a life of Brunel) to *The Story of William the Conqueror*, by Dorothy Margaret Stuart. (D. D. Ct.)

Child Welfare. **International Services.**—The several agencies of the United Nations providing services to children advanced substantially their world-wide activities during 1952.

The U.N. International Children's Emergency fund (U.N.I.C.E.F.) sustained extensive programs under its own auspices or in co-operation with the Food and Agricultural organization (F.A.O.) or the World Health organization (W.H.O.), in all cases working with government agencies in the countries assisted. It allocated \$14,013,000 for its 1952 program and anticipated a budget in excess of \$15,000,000 for 1953.

The major types of U.N.I.C.E.F. assistance were: general maternal and child health services; BCG (Bacillus-Calmette Guérin) vaccination and other tuberculosis control measures; campaigns against bejel, syphilis and yaws; antimalaria and other insect control measures; immunization against diphtheria and whooping cough; aid in production of antibiotics and insecticides; child feeding; milk conservation; and clothing, shoes, shelter and miscellaneous supplies. Dried skim milk was provided in large quantities in several underdeveloped countries where serious nutritional deficiency prevailed among children. Most of the resources of this organization were used, however, in the development of elementary health and welfare services. In contrast with its tremendous emergency feeding programs during the first years of the fund's existence, the emphasis in 1952 was on long-range projects whereby countries could lay a basis for more adequate feeding of their own children and for reducing illness and death among children.

FRENCH INSTRUCTOR teaching a nurse on fellowship the methods of re-adjusting children suffering from vasomotor disturbances. The International Children's centre in Paris co-operated with U.N. agencies in 1952 to offer advanced courses to child health and welfare specialists

The W.H.O. held its fifth World Health assembly in Geneva, Switz., May 5 to 22, 1952. The assembly adopted a 1953 budget for the W.H.O. of \$8,485,095, a substantial increase over the budget for 1952. This organization had 79 nations as full members and 3 as associate members.

The first four years of the W.H.O. saw unprecedented reductions in death rates in many countries and even greater reductions in rates of morbidity, with children the beneficiaries of the forces at work. Control of the most deadly communicable diseases was greatly advanced; increased production of food was assured as was the protection of food and water through public health measures. In all continents where malaria, plague, syphilis, trachoma, tuberculosis, typhoid fever, typhus and yellow fever traditionally had been prevalent, progress was made.

During a period of about one year ending in the summer of 1952, tests for tuberculosis were given to 7,255,122 and of those tested 3,512,761 were vaccinated. These were in addition to the 29,000,000 children and young adults tested in 12 countries and the 14,000,000 vaccinated during the international campaign conducted prior to June 1951 by U.N.I.C.E.F., Danish and Swedish Red Cross societies, Norwegian Relief for Europe and W.H.O.

Typical of W.H.O. activities was a seminar on mental health and infant development held in Chichester, Eng., in the summer of 1952, attended by doctors, nurses and social workers from 28 countries and territories. Another project reflecting a growing interest in W.H.O. in mental hygiene was a conference of experts on mental health aspects of adoption, held at U.N. headquarters in New York in September. Questions considered by this meeting included: What are the factors relating to the emotional and psychological development of the child that should be taken into consideration in the adoption process? What are the factors that relate to the emotional needs of the adoptive parents that should be taken into consideration? What factors should be considered that relate to the emotional needs of the natural mother who decides to relinquish her child?

Child welfare organizations throughout the world, government officials and representatives of various specialized agencies of the U.N. became aware in 1952 and preceding years of the need for many more workers than had been available in all of the professions serving children. Educators, religious workers, nurses, physicians (including pediatricians, public health practitioners and psychiatrists), psychologists, recreation leaders and social workers had been hard to find when international or local programs in behalf of children had been developed. Consequently the recruitment and training of workers in these and other professions had become major objectives in social planning. Scholarships and fellowships were made available under the auspices of governmental, international, religious and other voluntary agencies and foundations. Interchange of professional students and teachers in professional schools helped to make more universal than ever before the policies, practices and techniques of child welfare workers. Much of this building for the future was made possible by the Technical Assistance administration of the U.N. New professional schools were established. The All-India Institute of Health and Public Hygiene in Calcutta was an example of recently developed and expanded facilities for professional training. Beginning in July 1953 this institute was to offer postgraduate training for public health nurses and maternal and child health doctors. In Latin America the Institute of Inter-American Affairs, the Rockefeller foundation and the Institute of Nutrition for Central America and Panama joined in co-operative projects in which the training of work-

ENGLISH SCHOOLBOY reading one of the U.S. comic books which continued to find a growing market in England in 1952, despite protests from parents and educators

ers was an essential element.

International services on behalf of children and adults were seriously curtailed with the discontinuance in 1950 of the International Refugee organization (I.R.O.). By 1952 the governments of several countries had liberalized their laws and made other provisions facilitating emigration of refugees. Assisting in this development was the U.N. high commissioner for services to refugees, successor to the I.R.O.

International conferences in 1952 significant to the welfare of children included the three under auspices of the U.N., previously noted; the International Council for Exceptional Children, Philadelphia, Pa., April 30 to May 3; and the World Assembly of Youth, Dakar, Senegal, Fr.W.Af., July 28 to Aug. 10.

National Developments.—Ravages of war in Korea deprived the children of that country of many of the limited facilities available in times of peace. Relief efforts which would have brought to South Korea food, clothing, medical supplies and services from several countries under many auspices, were regulated in an effort of the U.N. military command to avoid confusion and duplications of services.

The United Nations Korea Reconstruction agency with headquarters in Pusan, Korea, provided a channel for all civilian relief.

Countries which a decade previously witnessed the killing, maiming and acute deprivation of children as a result of bombing attacks and other military actions were finding ways and means of reconstruction, in behalf of children and their families. Construction of dwellings, schools and hospitals was substantially greater than in 1951. Greece made great gains,

using the resources of the country as well as extensive aid from the United States. Among the hopeful developments was an increase in the number of women in professional services to children, especially in teaching, nursing and the practice of medicine. Women physicians in that country, who numbered about 300, still were restricted in their opportunities as professional workers but the demands for their services, especially in public health, pediatrics and general medicine marked departure from traditions which in this and most countries still kept women ignorant and children neglected.

Iran, the second largest country in the eastern Mediterranean area, confronted serious nutritional and general health problems and an exceedingly high rate of infant mortality. A study by the Rockefeller foundation in a rural area near Tehran showed that 230 out of 1,000 infants died during the first year of life.

In Africa, Asia and the islands of the Pacific mortality of children, though remaining high, was reduced to the extent that international and national authorities were becoming alarmed at increases in population out of proportion to the increases in food production. This subject, which received some discussion at the 1952 World Health assembly, but without majority support of measures for study of population problems, was to be reconsidered by various societies and agencies concerned with child welfare.

The population increase in the United States reflected by both a reduced mortality rate among young children and a higher birth rate than had been anticipated by health authorities was sufficient to overcrowd child care facilities, family housing units, hospitals and schools. This problem led the 81st congress to direct that a nation-wide survey of elementary and secondary schools be made. The survey included an extensive inventory of existing public-school facilities; a study of the current need for new construction; an estimate of the availability of state and local resources to finance needed new construction; and the development of a ten-year master plan for school plant construction and improvement. A progress report of the survey, published in 1952, with data from 25 states, rated 44% of the elementary schools as unsatisfactory, and many of these as well as the schools rated fair and satisfactory were seriously overcrowded.

Aid to dependent children, like most forms of federal social security, showed a marked drop in the number of recipients compared with the numbers in recent years. For the month of June in 1951 and 1952 the number of children thus aided was (1951) 1,617,893 and (1952) 1,527,375. The number of families dropped from (1951) 632,649 to (1952) 589,976. This apparently reflected improvements in employment, family incomes and standards of living.

The tendency to establish state youth authorities, a development of postwar years, was reflected in the passage of the Kentucky Youth Authority act, to become fully effective Jan. 1, 1953. Features of this law were vestiture in a central state unit responsibility for commitment of young people to state training schools and extension of the juvenile court age for boys from the 17th to the 18th birthday, the age for girls subject to juvenile court jurisdiction remaining at the 18th birthday. There, as in other states with or without youth authority acts, there was an inclination by court officials and those in charge of institutions to utilize as never before the services of psychiatrists and social workers, including professional group workers, in efforts to understand the problems of children and youth and give them the treatment and training for which such services reveal need.

Among state organizations most active in following up the findings of the Midcentury White House Conference on Chil-

dren and Youth was the Pennsylvania Governor's Committee on Children and Youth, which held hearings on unmet need of dependent and neglected children in 12 communities.

Health services throughout the country were improved. Typical of change in recent years was the increase in the number of cities adding sodium fluoride to their water supplies in an effort to reduce tooth decay in children. In 1950 the number of cities was 50, in 1951 it was 121, and 138 additional cities had approved this program.

The Child Welfare League of America in 1952 completed two-year study of residential treatment centres for emotionally disturbed children. The development of such centres during the last 20 years helped change the focus of the care of children whose own homes are unsatisfactory or unavailable to them. Such improved study of behaviour and the treatment provided by progressive child care agencies and institutions had become marked by teamwork among professional workers whose combined efforts had done much to reduce juvenile delinquency and emotional distress among children. (See also BIRTH STATISTICS; CHILD LABOUR; JUVENILE DELINQUENCY MARRIAGE AND DIVORCE; RED CROSS; SOCIAL SECURITY WORLD HEALTH ORGANIZATION.)

Chile. A republic extending along the southern Pacific coast of South America for about 2,600 mi., Chile has an average width of 110 mi. It is bounded on the north by Peru on the south by the Antarctic ocean, on the east by Bolivia and Argentina and on the west by the Pacific ocean. It has an area of 286,323 sq.mi. and a population of 6,032,376 (Apr. 1952 census). Santiago, the capital, including suburbs has 1,412,941 inhabitants (Apr. 1952 census). Other leading cities of more than 50,000 are Valparaíso with 222,238 inhabitants, Viña del Mar (88,196), Concepción (133,573), Antofagasta (72,838), Talca (63,602), Temuco (90,957), Osorno (75,151), Chillán (67,311) and Talcahuano (63,133). Religion: Christian, mainly Roman Catholic. Presidents in 1952: Gabriel González Videla after Nov. 3, Gen. Carlos Ibañez del Campo.

History.—During 1952 Chile continued to suffer from high prices, uncontrolled inflation, and difficulties in its world markets abroad. Its political life took a sharp turn to the right as a result of its presidential election.

There were several sporadic strikes during the year. In March more than 12,000 workers went on strike in the nitrate fields of Antofagasta and Tarapaca. They demanded a 40% increase in wages and better working conditions. There were several outbreaks of violence and a dynamiting attempt in the important nitrate deposits of Maria Elena. The strike was settled by the labour minister, Alejandro Serani Burgos, who offered a 16% wage increase.

Plans were intensified to increase steel and oil production. During 1951 the United States bought \$4,000,000 worth of steel from Chile and \$3,000,000 worth was sold to Argentina. M. V. Kellogg Co., a New York firm, contracted to build an oil refinery near Valparaíso with a producing capacity of 870,000 metric tons per year. This firm was also to take over the management of the over-all production and exploitation of oil deposits in southern Chile. The government made it clear, however, that it was not relinquishing ownership of its mineral wealth.

CHILEAN HYDROELECTRIC STATION harnessing water power from the Andes mountains (background) to power a new steel plant at Huachipato; it was one of six power plants being built in 1952 as part of a huge industrialization program in Chile

Early in the year relations with Argentina were somewhat strained and as a result the border between the two countries was closed, causing some food shortages in two Chilean towns located in the department of Aysén. Relations with the United States remained cordial and in April a mutual military aid agreement was signed between the two countries. The United States was to furnish technical and material aid to Chilean defenses which in turn would strengthen hemisphere unity.

The presidential elections held in September showed that Gen. Carlos Ibañez del Campo, a member of the senate who had been deposed as president in 1931 for his authoritarian methods, who was running as the candidate of the National Peoples Alliance, had a plurality of the vote with 432,930 ballots. Arturo Matte Larraín, former minister of finance, candidate of a coalition of rightist groups, polled the next largest number of votes with 252,648. The government candidate, Pedro Enrique Alfonso, former minister of interior, running on the Radical party ticket, received 183,783 votes. Sen. Salvador Allende, former minister of health, Socialist candidate running with left-wing support, received 51,984 votes. No candidate received an absolute majority, required under the constitution for election. The final election was up to congress, which on Oct. 24 named Ibañez president. He was inaugurated on Nov. 3.

(J. McAd.)

Education.—In 1948 the public primary schools had 518,446 pupils and the private and municipal primary schools 149,802 pupils. Secondary schools had 70,622 pupils. University education was available at the state university of Chile (5,287 students), the Catholic university of Santiago (1,528 students) and the University of Concepción. In 1951 there were 410 motion-picture theatres with seating capacity of 300,000.

Finance.—The monetary unit is the peso, valued at \$0.0070 U.S. currency, free market rate, on Sept. 30, 1952. The rate for imports into Chile was \$0.0166 (provisional commercial), \$0.0322 (official), \$0.0232 (banking market), \$0.02 (special commercial) or the free market rate, depending upon their relative importance to the economy. The 1953 budget, as submitted to congress, balanced revenue and expenditure at 42,377,000,000 pesos (1952 as enacted: 29,073,000,000 pesos). Actual revenue in 1951 was 26,008,000,000 pesos; expenditure, 27,640,000,000 pesos. Notes and coin in circulation on June 30, 1952, totalled 9,290,000,000 pesos; gold reserve \$41,500,000; sight and current deposits 20,090,000,000 pesos;

time deposits 6,040,000,000 pesos; government deposits 2,750,000,000 pesos. The cost of living index stood at 211 in July 1952 (1948=100).

Trade and Communications.—Exports in 1951 (excluding gold) amounted to \$371,000,000; imports were \$329,000,000. Leading exports were copper (48%), nitrate of soda (18%), metallurgical products, largely iron and steel (9%) and wool (6%); leading imports, machinery (18%), chemicals and drugs (16%), vehicles (11%), sugar and derivatives (6%) and petroleum and products (6%). Chief customers were the U.S. (51%), Argentina (7%), the United Kingdom (6%), Germany (4%) and France (4%); chief suppliers, the U.S. (55%), Argentina (8%), the United Kingdom (7%), Germany (5%) and Peru (4%).

The railway system totalled 5,434 mi. in 1949, of which 3,859 mi. were owned by the government. Highways (Dec. 31, 1947) included 1,785 mi. of international highway, 3,815 mi. of national highway and 26,300 mi. of provincial roads. Motor vehicles (Dec. 31, 1950) included 40,098 automobiles, 27,507 trucks and 4,164 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 85 vessels (100 tons and over) aggregating 168,349 gross tons on June 30, 1951.

Agriculture.—Production of the principal crops in the crop year 1951-52 was estimated as follows (in metric tons): wheat 988,000; barley 125,000; oats 110,000; rice (paddy) 80,000; beans 64,000; maize 89,000; and potatoes 473,000. Livestock included (1951) 2,186,000 cattle, (1949) 585,000 pigs, 636,000 goats and 6,345,000 sheep. Wool production averages 17,000 short tons a year, lumber production about 275,000,000 bd.ft. a year and landings of fish (including shellfish) about 70,000 short tons.

Manufactures.—Manufacturing establishments were reported to number 5,585 in 1948, with capital of 1,466,587,000 pesos and 296,000 employees. There were about 375 textile mills in 1950, including 43 cotton mills, 220 knitting mills and 46 silk and rayon mills. Production figures (1951) included steel 178,318 metric tons; pig iron 239,946 tons; cement 698,403 tons; woven cotton fabrics 43,500,000 yd.; and manufactured gas 142,800,000 cu.m. Chile became an iron and steel exporter for the first time in 1951. The index for manufacturing industries averaged 119 in 1951 (1948=100). Electrical energy is used extensively; production in 1951 was 1,680,000,000 kw.hr.

Mineral Production.—Chile is the leading mineral-producing country in South America. Production in 1951 included copper 379,707 metric tons; coal 2,211,295 tons; iron ore 3,174,338 tons; nitrate of soda 1,684,407 tons; gold 173,642 troy ounces; silver 983,468 oz.; mercury 10,540 lb. Petroleum production on Tierra del Fuego totalled 760,000 bbl. in 1951.

China. China borders the U.S.S.R. and Outer Mongolia for more than 6,000 mi. on the north and is flanked by Japan on the east and India on the southwest. Including Manchuria and Sinkiang on the mainland, and Formosa (Taiwan) and numerous other islands, it has a total area of 3,876,956 sq.mi. with a population of approximately 475,000,000. After the advent of the Chinese Communists and the flight of the national government to Formosa toward the end of 1949, China was virtually divided into two entities: Communist China on the mainland and the nationalists on Formosa.

The Central People's (Communist) government in Peking, with Mao Tse-tung (*q.v.*) as its chairman, was founded on the ideologies of Marx, Lenin and Stalin and Mao's new democracy, while the national government in Taipei, Formosa, with Chiang Kai-shek (*q.v.*) as its president, was based on Sun Yat-sen's "Three Principles of the People" and the five-power constitutional system.

There were eight cities with more than 1,000,000 population in 1950: Peking, 1,940,290; Shanghai, 5,406,644; Tientsin, 1,785,813; Mukden, 1,551,317; Canton, 1,495,694; Port Arthur, 1,054,466; Chungking, 1,038,683; Nanking, 1,020,000.

History.—The continuation of the fundamental policy of the People's government in aiding North Korea and resisting the United States resulted in 1952 in a still greater and more ruthless control of China's mainland by the Communists. This was aimed at remodelling Chinese society and changing the very nature of the Chinese. Politically, the People's dictatorship under the leadership of the Chinese Communist party, buttressed by the People's Liberation army and militia, People's courts and citizens' security committees, tightened further its grip and allowed no opportunity for any opposition to survive. Economically, after the liquidation of the landlords, the urban middle classes were under attack. Through its expanding network of state trusts, trading companies and co-operatives, the People's government controlled all sectors of the economy on the mainland. On the social front, both the Confucian culture and tradition, with its emphasis on the family system, and

the newer cultural influences of the west were to be eliminated. Western educated persons were particularly exposed to ideological remoulding or a process of "brain-washing." These harsh measures of control alienated the support of a large portion of the population which the Communists had enjoyed during their initial success in overthrowing the nationalists. Many Chinese, especially the overseas groups, swung their support openly to the nationalists in Formosa. However, the Peking government, in its policy of siding with the Soviet Union against the western democracies, appeared to be determined to advance its aspirations and contribute its share to the larger cause of world communism.

The impact of the Korean war and the western embargoes that accompanied it affected the economy of Communist China and led also to a speed-up in the rate of the Communist revolution in both rural and urban areas. On Jan. 5, 1952, a decree was issued enforcing the "triple opposition" movement against corruption, waste and bureaucratism inside the government. In February the collateral "five opposition" movements were introduced under which businessmen had to confess their alleged economic sins and restore to the state such proceeds as they were charged with having accumulated through bribery, tax evasion, fraud, theft of state property and theft of state economic secrets. After about three months of frantic mass confessions, accusations and financial levies, the will and the economic back of the urban middle class appeared to be broken and the Peking government collected a windfall of hard-currency bullion and recoverable foreign exchange estimated at more than U.S. \$200,000,000. In terms of human lives, press reports from Formosa gave the following figures: the total number of persons arrested during the drive amounted to 270,000, of which 30,000 committed suicide, 500 leading merchants and industrialists were put to death, 4,000 were given prison terms of 15 years and 30,000 received sentences of more than 10 years. In June the Peking government declared that the land reform involving expropriation and redistribution of landlords' property had been completed in most of China. In the meantime, the soviet type of state farm had been introduced as a basic model of socialist enterprise. In July a new forced labour decree giving public security bureaus administrative power to put "historical counterrevolutionaries" under control for ideological education and reform was promulgated, and a new program of construction apparently destined to follow the initial three-year rehabilitation program was announced. In August, in a cabinet reorganization which was regarded as a forerunner of a tighter nation-wide development plan geared to the defense program, five new economic ministries were set up.

The negotiations for an armistice in Korea became tortuous and fruitless, as the United Nations negotiators took the position from the beginning that the negotiation was military, while the Chinese and North Korean Communists never lost sight of the disputed fundamental Asiatic political problems. Consequently, in January at the United Nations general assembly meeting, the soviet proposal to shift the truce talks from Korea to the Security council found no support. The unremitting pressure of Communist expansion in the far east compelled the United States to take a firmer attitude in meeting it and brought the United States and the United Kingdom closer in their policies on the far east. In a communiqué issued on Jan. 9 after the conversations between Prime Minister Winston Churchill and Pres. Harry S. Truman in Washington, D.C., they declared that regarding the far east "a broad harmony of view had emerged from these discussions; for we recognize that the overriding need to counter the Communist threat in that area transcends such divergencies as there are in our policies toward China." On Jan. 17 Churchill declared before the U.S. congress

that "I am very glad that whatever diplomatic divergencies there may be from time to time about procedure, you do not allow the Chinese anti-Communists on Formosa to be invaded and massacred from the mainland." Churchill's pronouncement created criticism and opposition in the British parliament and on Jan. 30 he explained to the house of commons that his statement before the United States congress that Britain's response to any breach of a Korean armistice would be "prompt, resolute and effective" meant no shift in the British Asian policy. On Jan. 28 the United States, the United Kingdom and France served notice that they would call for U.N. action to meet any new Communist attack in southeast Asia.

On the next day the political committee of the general assembly found the Soviet Union guilty of having failed to live up to the 1945 treaty of friendship with the national government, which for three years had been trying to get a U.N. verdict against the Soviet Union. On Feb. 1 the general assembly approved the report of its political committee on China's complaint against the Soviet Union by a vote of 25 to 9 with 24 abstentions, including France and the United Kingdom. On Feb. 5 the general assembly decided to postpone any discussion of a permanent settlement of the Korean war until an armistice was reached. In the meantime the truce talks in Korea remained deadlocked on the issues of the building of air bases in North Korea after a truce, the inclusion of the Soviet Union among the neutral nations that would supervise the truce, and the exchange of prisoners. In March, Peking formally charged the United States with germ warfare in Manchuria while Jacob Malik, the soviet representative at the meetings of the United Nations Disarmament commission, accused the United States of using germ warfare in Korea. These charges were denied by the United States authorities, and T. F. Tsiang, Chinese delegate on the commission, stated that the Communists had invented germ warfare to cover up epidemics caused by their own mismanagement. To break the deadlock in truce negotiations, Vice Adm. C. Turner Joy presented on April 28 on behalf of the United Nations a "package formula" for settlement of the issues. But the Communists rejected voluntary repatriation of prisoners, on which point the United Nations delegates held firm.

A new phase of the Korean war was opened when the United Nations forces began to launch intensive bombing attacks on hydroelectric power plants in the Yalu river district and other parts of North Korea in June. On June 28 Peking charged that the bombing of the Yalu power stations was a further provocation to wreck the Korean armistice negotiations and to undermine peace in Asia.

To implement and broaden Soviet-Chinese relations and to co-ordinate their efforts in their struggle against the west, high officials from Peking headed by Premier and Foreign Minister Chou En-lai arrived in Moscow on Aug. 17 for talks with the soviet leaders on important questions, including the Korean war and Peking's role, the status of the Chinese Changchun railway, Dairen and Port Arthur, relations with Japan, and soviet aid to China's construction and military modernization program. On his return to Peking on Sept. 24, Chou declared that a broad understanding and new agreements had been reached and that Chinese-Soviet relations had been further strengthened.

No diplomatic relations between Peking and London had been established since Britain conveyed its decision to recognize Peking in Jan. 1950. Following a riot in Hong Kong on March 1 in which a number of Chinese were arrested and injured, Peking lodged a formal protest calling the incident a "barbarous massacre of the local Chinese inhabitants." When the British highest court reversed a Hong Kong supreme court decision awarding 40 former Chinese nationalist transport planes to Peking and ordered that they be turned over to a United States

air line which bought those planes, Peking warned Britain of the consequences. On the other hand Britain, which represented also the interests of the United States and Canada in China, protested in April and September against the mistreatment inflicted on British, Canadian and U.S. nationals arrested and detained in China. Britain's hope to revive its trade, which constituted a major consideration behind British recognition of Peking, was shattered when the British concerns with an investment estimated at more than £2,000,000,000 decided to leave the China mainland in May.

A series of border clashes between Portuguese Macao's garrison and Chinese troops broke out in July, and in August an agreement was reached in settlement of the frontier shooting. In Tibet, troop clashes between the Chinese and Tibetans and agitation against the Chinese were reported. However, an agreement between the Chinese and Tibetan governments was reached in August under which Tibet was to have a permanent representative in Peking to deal with matters affecting Tibet's internal economy and Chinese-Tibetan trade. It was reported in the summer that the negotiations between India and China concerning Indian-Tibetan relations and the recognition of Chinese sovereignty over Tibet reached a satisfactory agreement on fundamentals.

The prolongation of the Korean war and the threat of Communist expansion in southeast Asia coincided with a policy of more definite aid to the national government by the United States. In his message to congress on March 6 asking for more than \$7,000,000,000 for the Mutual Security program, President Truman stated that a large part of this sum would "help prepare the Chinese armies on Formosa to resist aggression." However, the United States policy toward Formosa remained unchanged in so far as allowing and helping the national government's forces to invade the mainland was concerned. This was made clear by Gen. William C. Chase, commander of the U.S. Military Assistance Advisory group in Formosa on May 1, when he stated that although the combat efficiency, morale and physical condition of the Chinese national army had improved considerably, his mission was still one of neutralization. To encourage private U.S. investments in Formosa, a formal exchange of notes on the extension of the U.S. private investments guaranty program to that area took place on June 25.

The position of the national government in signing a separate peace treaty with Japan was of some international significance. In January Japanese Premier Shigeru Yoshida officially revealed to the Japanese diet that he had agreed to a limited recognition of Chiang Kai-shek's regime as the legitimate government of China at the request of the United States, and, consequently, invited the national government to accept the proposal for a treaty of peace with Japan. On Feb. 19 formal discussions on a bilateral agreement between Japan and China opened in Taipei, and after more than two months of devious negotiations a separate treaty of peace between Japan and China was completed on April 27, whereby Japan recognized the national government's jurisdiction over Formosa and other territories which might thereafter be under nationalist control, while China waived its claims for reparation. The separate peace treaty was signed on April 28 in Taipei. (See also COMMUNISM; FORMOSA; KOREAN WAR; UNION OF SOVIET SOCIALIST REPUBLICS.)

Education.—In Communist China, education is a means for social reform and not for the growth of personality, and it is controlled completely by the government. According to this policy, the subtle influence of the "imperialist west" must be eradicated and the English language must be removed entirely from the lower schools. The latest official figures (in 1952) placed the number of schools and their enrolments at the end of 1951 as follows: nearly 250 colleges and universities with 175,000 students; 5,442 secondary schools with more than 2,000,000 students; 541,000 primary schools with more than 43,000,000 pupils accounting for 55% of the total school-age children on the mainland. During 1952, in order to exercise greater control by the government, a number of univer-

PROPAGANDA PHOTOGRAPH (left) captioned as a sample of the "germ bombs" dropped in Korea by "U.S. invaders," as published in the *Peiping People's Daily* in 1952. Right: Fully loaded M1621 cluster adapter bomb holding 22,500 psychological warfare leaflets which, according to the U.S. army, is the type of bomb shown in the picture at left

sities were consolidated, Yenching university, Peking, was closed, and the Tsinghua university, Peking, originally founded on the Boxer indemnity, was reduced to an engineering college.

Defense.—To build up a modern army, navy and air force, Peking launched a large-scale military training and development program in Dec. 1950 and, as a result, Communist China's military forces were regarded in 1952 as stronger and larger than in 1950 when they entered Korea. In the later part of 1952, the size of the regular People's Liberation army was listed at about 3,000,000, in addition to 1,500,000 to 2,000,000 regional and district troops, 600,000 to 1,000,000 public security troops, and about 13,000,000 home guard militia reserve. It was reported that by a secret military pact signed in Oct. 1951, the Soviet Union pledged to help Peking to maintain a regular army at more than 3,000,000 men and that during the fighting in Korea the Soviet Union would give a \$24,000,000 monthly subsidy to the Chinese forces. The Chinese Communist air force was believed to have about 1,800 planes, approximately half of them jet fighters.

About 200,000 out of approximately 600,000 of the total nationalist forces on Formosa were believed to be well trained and equipped. The nationalist air force consisted of about 300 mostly worn-out and obsolete planes and its navy had more than 100 small vessels. About 62% of the budget of the national government was for military expenditures.

Finance.—According to an official report on Aug. 6, 1952, Peking achieved a balanced budget in 1951, and on the same day the People's Government council adopted the 1952 budget, which represented an increase of 41% over the previous year's budget. A private source estimated, Peking's 1950 expenditure at U.S. \$2,400,000,000 and the first half of its 1951 expenditure at more than U.S. \$5,000,000,000. It was believed that Peking's 1952 expenditure must be more than U.S. \$8,000,000,000.

The national government depended largely on the United States aid to balance its budget. In 1952 the official rate of exchange of the Formosan dollar was 15 to U.S. \$1, and the People's bank dollar more than 20,000 to U.S. \$1.

Trade and Communications.—On the mainland, trade was put under complete control by the government and no trade statistics since 1949 were available. Peking claimed that the volume of foreign trade in 1951 increased more than 250% compared with 1950 and that its aggregate value in 1951 was twice that of 1950, "far exceeding the prewar level." Agricultural, livestock and mineral products were the main exports while industrial products and machinery, equipment, and semfinished goods constituted the main imports on the mainland. Peking's trade was confined largely to the Soviet Union and its satellite countries.

Under the People's government, practically all the railway lines had resumed their prewar position. In 1951 the Nanning-Chenankuan railway of about 100 mi. was opened to traffic. In July 1952 the Chengtu-Chungkiang railway of about 300 mi. was completed, and at the end of September the Lunghai railroad was extended to Lanchow. With soviet aid, Peking planned to extend the Lunghai railway to the west to connect it directly with the Turkestan-Siberia railway, to build the Lanchow-Swallow line, and to build a line in Yunnan connecting Kunming with southeast Asia.

Agriculture, Manufactures, Mineral Production.—Production statistics were fragmentary and mainly in percentage figures. Peking claimed that the 1951 agricultural output increased by more than 7% compared with that of 1950, and that it approached the prewar level, which was estimated at an annual average of 140,000,000 tons. According to an official report, the total value of industrial production increased by 267% in 1951, compared with 1950, and the 1952 industrial production would be a bigger increase over 1951. Compared with the figures for 1950, the output of rolled steel in 1951 went up 76%, cement 63%, coal 18% and paper

35%. It was stated that China began to manufacture textile machinery and steel rails in large quantities in 1952. The number of co-operatives on the mainland was said to have reached more than 39,000 with a membership of more than 82,000,000. (H. T. CH.)

Chiropactic: see MEDICINE.

Chou En-lai (1898-), Chinese Communist politician, was born at Huaiyin, Kiangsu province. He attended a Nankai middle school in Tientsin, Waseda university in Japan and Nankai university. In 1919, in Tientsin, he led a student rebellion which resulted in his arrest and imprisonment. In 1924 he joined Sun Yat-sen's movement and was made director of political training at Whampoa Military academy.

During Chiang Kai-shek's anti-Red drive of 1927 Chou was captured but escaped. He visited Moscow (1928-31) and served as a delegate to the sixth congress of the Comintern. In 1937 Chou and Chiang Kai-shek established a united front against Japan. This Nationalist-Communist truce was, however, not durable, and later truces, including one arranged in 1946 by Pres. Harry S. Truman's personal representative, Gen. George C. Marshall, were also of short duration. After the Communists extended their control over most of China in 1949, Chou became prime minister and foreign minister of the new Chinese people's republic. He signed the Sino-Soviet treaty of friendship, alliance and mutual aid in Moscow on Feb. 14, 1950.

In Aug. 1952 Chou headed another Chinese delegation to a conference in Moscow to discuss political and economic questions between the two countries. On Sept. 16 it was announced that control of the Changchun railroad in Manchuria would be turned over to the Chinese by Dec. 31, but that Soviet forces would continue to use Port Arthur until the two countries made peace with Japan.

Christian Science. Continued steady growth throughout the world was reported by the Mother Church, the First Church of Christ, Scientist, in Boston, Mass. Identified with the religion discovered and founded by Mary Baker Eddy, the Mother Church in 1952 had 3,067 branches in the United States and about 40 other countries, and college and university organizations on 116 campuses.

The Christian Science textbook, *Science and Health with Key to the Scriptures*, by Mrs. Eddy, continued to be the best-selling religious textbook with the exception of the Bible. A Dutch translation was published during the year.

Church officials reported that testimonies of Christian Science healing which were on file included those of cancer, deformity, imbecility, poliomyelitis, gallstones, arthritis, heart ailment, nephritis and carious bones and flesh.

Members of the Christian Science board of lectureship were assigned to lecture tours during the year in continental Europe, Great Britain, Africa, Canada, the orient, Ireland, Mexico, South America, Australia, New Zealand, Alaska and the United States.

With continued expansion of the military forces of the United States, 14 Christian Science chaplains were on active duty with troops, 4 of them in Korea. More than 360 civilian camp welfare workers, serving as Christian Science practitioners, were ministering to hospitalized veterans and members of the armed forces.

Relief activities of the Mother Church were both national and international in scope during 1952. Approximately \$200,000 was voluntarily contributed by Christian Scientists to aid sufferers in the Kansas-Missouri valley flood. The overseas relief division of the denomination sent approximately \$46,000 worth of used clothing to its churches in Austria, France, Germany, Great Britain, Indonesia, Italy, the Netherlands, Norway and

Greece, and to individuals in Finland, Korea and Yugoslavia. Food parcels totalling \$13,000 were also sent to these countries.

The denomination provided approximately \$680,000 toward the operation of its three charitable institutions during the year. (T. E. HY.)

Christian Unity. Three processes promote unity among Christ's followers. The first develops fellowship and co-operation. The second finds organized ways of working interdenominationally. The third directly seeks organic union of churches. Historically, the first two have often led to the third. In 1952 progress was made in all three ways by the non-Roman churches.

Increasing consciousness of belonging together was revealed in a constantly multiplying number of events. Examples were: an increasingly wide international observance of World Communion Sunday both overseas and in North America; participation by churches of more than 3,000 North American communities in the launching of the first 1,000,000-copy edition of the Revised Standard Version of the Bible, produced and copyrighted by the National Council of Churches (representing officially more than 30 denominations); the first all-Latin-American conference of Evangelical university students at São Paulo, Braz., under the auspices of the World Student Christian federation; and a remarkably representative study meeting of laymen at Buffalo, N.Y., for the North American Lay Conference on the Christian and his Daily Work, jointly sponsored by the Canadian, the U.S. and the World Council of Churches.

Organized ways of working together were demonstrated in many important events throughout the world. Two agencies of the International Missionary council (175 denominations) and the World Council of Churches (158 denominations) met in Willingen, Ger. These were the joint committee of the two councils and their joint commission of the churches on international affairs. The first handles policy making and general organizational co-operation. The latter deals with such problems as those of dependent peoples, resettlement of stateless persons, and religious liberty. It planned continued representation before governmental bodies and co-operation with cognate United Nations commissions. The World council's department of inter-church aid and service to refugees met to plan its resettlement work, which included the use of funds allocated by the high commissioner of the U.N. for refugees. It reported resettling more than 100,000 persons. Its relief work for the first half of 1952 showed that denominations linked to the National council and World council in the U.S. increased gifts 25% above 1951's record. More than \$3,000,000 worth had been sent to Korea, Greece, India, Lebanon and other centres of crisis.

The International Missionary council held an enlarged meeting in Willingen, Ger., to deal with an over-all examination of the problems and policies of missions. Delegates from 175 denominations in 50 nations including some "iron-curtain" countries attended. The number of foreign missionaries at work from non-Roman churches of North America was at an all-time high of 15,000, compared with the previous high of 13,555 in 1925. Two communion services at Willingen—one Anglican and the other Reformed—welcomed all delegates without distinction.

Various co-operative church undertakings of world-wide scope were furthered at meetings in Denmark of the World council's study commissions as well as by its executive committee. The latter completed at Nykøbing, Den., plans for the recommended program of the second world assembly to be held in Evanston, Ill., in 1954. It allocated 600 seats to 160 member denominations and appointed chairmen for preparatory commissions on evangelism, a responsible society, international affairs, race relations

and the work of the laity. Plans were likewise completed for participation of the churches in the third Christian World Youth conference which was held in December in Kotayam, Travancore, India, with youth attending from the co-operating churches of 56 nations. Sponsors in addition to the World Council of Churches were the World's Young Men's and Young Women's Christian associations, the World Student Christian federation and the World Council of Christian Education.

In their first theological conference the churches related to the Indonesian National council planned a common standard of ministerial training and strengthened their commission on missions. The new International (interdenominational) Christian university was formally opened at Mitaka, near Tokyo, Jap., with 2,000 students applying for 75 places under one faculty. A United Council on Christian Literature for Overseas Chinese was founded in Hong Kong. The (American) United Board for Christian Colleges in China took steps to finance and establish a Christian college in Formosa—10 or 11 of its 13 member union universities in China having been taken over by the Communists. The annual German Evangelical Church congress (*Kirchentag*) took place in Stuttgart. Despite the refusal of east German border passes to 20,000 would-be participants, the meeting was highly representative and provided another evidence of revitalized and spiritually united Protestantism in Germany.

The outstanding church unity event was the third World Conference on Faith and Order, for the first time under World Council of Churches auspices, at Lund, Swed. It continued the work of conferences at Lausanne, Switz., in 1927 and Edinburgh, Scot., in 1937 for the examination of things which divide and things which might unite the churches, 110 Anglican, Orthodox and Protestant denominations being represented. Unofficial Roman Catholic observers were present. The program dealt with the nature of the church, ways of worship and intercommunion. The fact that delegates were sent from all parts of the earth and even from churches in three "iron-curtain" lands evidenced strong concern over unity. The conference had no authority to undertake action for organic union, which was solely the prerogative of autonomous churches acting for themselves. Yet experience had shown that after the two previous similar conferences the rate of organic unions of formerly separated churches was accelerated, more than 40 such mergers having been consummated since the conference at Lausanne in 1927, involving more than 90 denominations. Features of the Lund meeting were: an open communion service in the 11th-century cathedral from which only a few felt compelled to abstain; stress on nontheological factors preventing church union; and participation by delegates from many younger churches in Africa, Asia and Australasia. Many unions had taken place among these and more were reported in process. It was declared at the conference that "the implication of our confessed unity in Christ . . . is that we should do together everything except what irreconcilable differences of sincere conviction compel us to do separately."

Only one organic union actually was consummated in the year (up to October) and that was announced as completed on Jan. 11 when the Restored Evangelical Lutheran church of Holland merged with the Evangelical Lutheran body. A plan for the union of three Presbyterian bodies in the U.S. was announced as being submitted to the general assemblies of all three in 1953. The proposed five-way merger of Lutheran bodies in America seemed nearer consummation. In Australia a special commission completed a new plan for reunion of the Anglican and Protestant churches. In Canada no progress was reported in negotiations between the United church and the Anglicans. (See also RELIGION.) (H. S. LR.)

Chronology: see CALENDAR OF EVENTS, 1952, pages 1-16.

Churchill, Winston Leonard Spencer (1874-), British

statesman, was born at Blenheim palace, Oxfordshire, on Nov. 30. For his biography and political career during World Wars I and II, see *Encyclopædia Britannica*. After the defeat of his government in the general election of 1945, he led the Conservative opposition in the house of commons. His speech at Fulton, Mo., in 1946 was regarded as the starting point of the movement for European unity and for a Council of Europe. In the general election of Oct. 1951 the Conservatives were returned to power and on Oct. 26 Winston Churchill again took office as prime minister. He left for the United States at the end of 1951 and, during Jan. 1952, he had discussions with Pres. Harry S. Truman and addressed congress. He also paid a short visit to Canada where he had talks with the Canadian prime minister, Louis St. Laurent. He returned to England at the end of January. On Feb. 7 he broadcast on the occasion of the death of George VI the previous day and on Feb. 15 attended the state funeral. On April 25 he spoke of hopes of national solvency in three or four years, at the annual Primrose League Grand Habitation demonstration at the Royal Albert hall. In general his utterances were noticeably concerned with the gravity of both the economic and international situations. On May 20 at the Conservative women's annual conference he appealed for time before judgment was passed on the Conservative government, and on June 11 at a Press association luncheon in London he spoke of the "trap door" upon which the present standard of living was supported. On June 17 he reviewed favourably the talks he had had with the Australian premier, R. G. Menzies, on matters of common concern. On July 1 he praised the patience of the United States in dealing with the Korean war, but regretted that British leaders had not

"CHURCHILL PREPARES FOR THE AMERICAN EXPEDITION," a cartoon by Long of the *Minneapolis Tribune*, published in 1952

been consulted before the bombing of North Korean power stations. Addressing his constituents at Woodford on Sept. 6, Churchill forecast that in the second half of 1952 Britain would be in balance with the nonsterling world and that the whole of the sterling world would be in balance with the rest of the world. On Oct. 4, in a broadcast, he launched the George VI Memorial fund.

Church Membership. The latest information in 1952 concerning church membership in the 252 religious bodies in continental United States, appearing in the *Yearbook of American Churches* (New York, 1952), indicated that there were 88,673,005 persons in 284,592 local churches or congregations. The figures were mainly for years ending in 1951. This compared with 86,830,490 members reported in the *Yearbook* a year earlier. There were 70 religious bodies reporting more than 50,000 members (see Table I), and their total membership was 87,081,504, or more than 98% of all members of religious bodies. The remaining 2% was found in the 182 smaller bodies of the nation.

*Not reported in 1951.

†As of 1936.

‡Reported as Christ Unity Spiritual Science Church in 1951.

Church membership, officially reported, had been increasing for many years, as had also the proportion of church membership in the total population. In 1951 church members were about 58% of the population. Since 1926, the date of the last adequate census of religious bodies made by the bureau of the census, church membership had increased about 50%, while the estimated population increased more than 30%. However, nothing was known about church attendance or other participation, or the proportion of church members contributing.

The Church of Christ, Scientist, does not report membership because a regulation of that body forbids the numbering of the people and the reporting of such statistics for publication.

In 1951 about 59% of church members in the U.S. were classified as Protestant, 33% Roman Catholic, 6% in Jewish Congregations and 2% in all other bodies including Eastern Orthodox and Old Catholic.

(B. Y. L.)

Principal Religions of the World.—Statistics of the world's religions are only very rough approximations. Aside from Christianity, few religions, if any, attempt to keep statistical records; and even Protestants and Roman Catholics employ different methods of counting members. All persons of whatever age who have

received baptism in the Roman Catholic Church are counted as members, while in most Protestant churches only those who "join" the church are numbered. The compiling of statistics is further complicated by the fact that in China one may be at the same time a Confucian, a Taoist and a Buddhist. In Japan, one may be both a Buddhist and a Shintoist. Civil Aeronautics Administration. The year 1952 promised to be one of the best in the history of commercial aviation. In June the domestic air lines carried more than 2,000,000 passengers more than 1,000,000,000 revenue passenger-miles.

During the first six months of the year both the domestic and international scheduled carriers showed gains in every category except air express.

Revenue passenger-miles flown by domestic scheduled carriers increased 17%, from 4,998,142,000 in the first six months of 1951 to 5,848,655,000 in the first six months of 1952. Revenue passenger-miles flown by international scheduled carriers also increased 17% in the same period, from 1,190,179,000 in 1951 to 1,392,412,000 in 1952.

Ton-miles of freight carried by domestic scheduled carriers increased 8% in the first six months of 1952 compared with the first half of 1951, while ton-miles of express decreased by 16.8%. Express and freight ton-miles in international operations, for the same period, increased 9.9%; ton-miles of U.S. mail increased 16.9% in domestic operations and 2.1% in international operations.

A total of 1,655 civil aircraft were manufactured in the first six months of 1952 compared with 1,477 for the same period in 1951, an increase of 12%.

The domestic scheduled air lines' passenger fatality rate per 100,000,000 passenger-miles for the first six months of 1952 was 0.8 compared with 1.9 for the same period in 1951. The international carriers' passenger fatality rate in the first half of 1952 was 6.4 per 100,000,000 passenger miles; the corresponding rate for the first six months of 1951 was 2.5.

During the first six months of the year there was a decline in the number of all classes of pilot certificates issued compared with the same period in 1951. Student pilot certificate issuances declined 33%, private pilot issuances 26%, commercial issuances 20% and air line transport pilot issuances 21%.

On June 30, 1952, the end of the sixth year of the 12-year \$520,000,000 Federal Aid Airport program, a total of \$183,145,451 in federal funds had been programmed, of which \$181,729,792 had been put under contract. Federal funds had been granted to 2,286 projects at 1,159 different airports. Of this total, 1,680 projects had been completed and 353 were under construction.

The Civil Aeronautics administration opened 45,000 mi. of ultramodern very-high-frequency airways in the United States on June 1. These new Victor airways offer increased accuracy and simplicity in air navigation over much of the United States to all types of aircraft. Of the 45,000 mi. of Victor airways, 35,000 mi. are primary routes and 10,000 mi. are alternate routes. Numbered like highway routes, the odd-numbered Victor airways run north and south while even numbers designate east-west routes. The new airways eventually would largely replace

TEMPORARY CAMP SITE for construction workers at one of five bases for the U.S. air force being rushed to completion in French Morocco in 1952. This camp, with a personnel of about 10,000, had its own theatre, power station, wells and water reservoir (above left)

the existing 70,000 mi. of airways based on the low or medium frequency, four-course radio ranges. Cornerstone of the Victor airways is the very-high-frequency omnidirectional range, commonly referred to as the omnirange, which offers courses in all directions. By midyear the CAA had commissioned more than 350 omniranges in the domestic United States out of a planned total of more than 400.

At the request of the air force, action was taken to provide aircraft movement information service at 11 air route traffic control centres. Flight movement data is collected from all sources on aircraft penetrating or operating within air defense identification zones and delivered to air defense units at the proper time. By July 1 steps had been taken to carry out the program at Boston, Atlanta, Detroit, Minneapolis, Great Falls, Seattle, Oakland, Los Angeles, Washington, D.C., New York and Albuquerque.

Major type certification projects during the year included the VC-340 (Convair Liner) and the large passenger-carrying version of the S-55 Sikorsky helicopter.

As of June 30, CAA had certificated six turbojet engines, four axial and two centrifugal, with a maximum dry take-off rating of 5,800-lb. thrust.

An outgrowth of the accidents at the Newark, N.J., airport was the appointment of the President's Airport commission to study the problem of airport location and use. The administrator of civil aeronautics served as a member of the commission and CAA staff members assisted in the preparation of the commission's report, *The Airport and Its Neighbors*.

Indications were that the widespread gains registered in 1951 in the ownership and use of planes by business firms and farmers would continue in 1952. Three-quarters of the planes

produced during the first seven months of the year were three- to five-place models.

A program of safety education of aerial applicators and their pilots was conducted with effective results. The CAA promoted nation-wide air tours designed to acquaint farmers and others with the value of aircraft in determining good and poor practices in soil conservation.

The Technical Development and Evaluation centre at Indianapolis, Ind., continued its work on the aircraft fire prevention program. Reports were issued regularly to the industry and the military services on the results of full-scale tests of fire extinguishing agents, methods, rates of agent discharge, and fire detection systems on jet and reciprocating engines.

Evaluation of the nuclear soil moisture and density measuring devices under field conditions continued. A preliminary model of a nuclear device to indicate moisture and density conditions near the surface of the soil was completed for use in compaction control during construction of pavements and embankments.

One of the most important services added by United States flag carriers during the year was the introduction of tourist flights across the North Atlantic. Inspection and planning assistance was provided by the CCA.

Technical consultative services were given to several foreign countries under the Mutual Security act of 1951, and civil aviation representatives from many countries were given demonstrations of United States equipment, aircraft and air navigation aids. (See also AIRCRAFT MANUFACTURE; AVIATION, CIVIL.)

(B. M. St.)

Civil Defense, U.S. Civil defense is an integral part of the national security program. Its mission is to protect people, property and production in the United States in case of war, and to serve in peacetime disasters in most states.

Responsibility for civil defense is vested primarily in the states and their political subdivisions, with the federal government providing co-ordination and guidance, in accordance with the Federal Civil Defense act of 1950 (public law 920). This act, approved Jan. 12, 1951, established the Federal Civil Defense administration (FCDA) in the executive branch of the government with responsibility for developing a national program to minimize casualties and damage from attack and to maintain maximum civilian support of the nation's armed forces.

The program is based on the principles of self-protection and mutual aid by individuals, groups, industries, communities, the states and the nation. FCDA assists the states in carrying out the program by matching their appropriations for essential facilities, equipment and supplies, by giving technical advice and training, and by providing public education programs.

FCDA is responsible for a national communications system for disseminating warning of impending attack; for stockpiling medical, engineering, welfare and other emergency supplies and equipment; and for encouraging states to enter into mutual aid compacts with other states and with neighbouring nations.

The states carry out the program through volunteer workers supervised by full-time staffs. At the close of 1952, all states, territories and major cities had civil defense organizations. Civil defense laws had been enacted in 47 states and all territories. Mutual aid compacts existed among 26 states, and most states had authorized similar agreements among their communities. Civil defense forces were actively serving in peacetime emergencies and disasters in 32 states and 4 territories.

In 1952, surveys indicated that more than three-fourths of people in major U.S. cities were aware of some simple specific things they should do to protect themselves against atomic

attack. Four-fifths of critical target area residents believed civil defense necessary. About 90% of 1,468 elementary and secondary schools and colleges queried had civil defense instruction courses. Civil defense was an active co-sponsor of the national blood program and the Ground Observer corps, and initiated through private organizations a nation-wide mass registration for home defense.

Volunteer enrolment rose to 3,300,000, or 23% of the number required for full mobilization. State staffs increased one-third. Half the required number of volunteer firemen and auxiliary police were enrolled, as were 20% of wardens, 13% of emergency welfare workers, 12% of engineering workers and 12% of volunteers needed to give first aid and medical care. The Ground Observer corps had approximately 152,000 members recruited for the air force by the state civil defense directors.

Three thousand students representing most states, territories, possessions and more than 600 cities attended the FCDA Staff college at Olney, Md., and the training schools at Ogontz Center, Pa., Stillwater, Okla., and Saint Mary's, Calif.

A nation-wide warning attack system linking 175 key points was completed, and a communications network to supplement leased wire facilities neared completion. A national emergency control centre was established and an alternate control centre was being installed. Sirens and other devices capable of warning 40% of the residents of critical target areas were financed, as were 27% of radio equipment needs.

Federal and state funds were allotted for blood plasma and plasma expanders for 1,600,000 casualties, and whole blood equipment for 3,000,000. A week's emergency medical care for approximately 2,000,000 was assured.

Total federal appropriations for civil defense since enactment of the new law had amounted to \$145,000,000, of which \$86,000,000 was for stockpiling and \$33,000,000 for matching state and local funds. State and local governments made available a total of \$223,000,000 for civil defense. Considerable savings were effected through competitive bidding and bulk buying.

Millard Caldwell, former member of congress and governor of Florida, was FCDA administrator. James J. Wadsworth, former member of the New York state legislature and government executive, was deputy administrator. (See also CIVIL AERONAUTICS ADMINISTRATION; MUNICIPAL GOVERNMENT.)

(M. F. CL.)

Civil Rights: see EDUCATION; LAW; NEGROES, AMERICAN.

Civil Service. **United States.**—The two dominant trends in the public service during 1952 were foreshadowed before the year began. They were: (1) a continuing build-up of civilian employment in the executive branch of the federal service; and (2) an increase in living costs which brought renewed demands for pay increases for public employees in all levels of government. Both were directly attributable to the accelerated defense program and the continuation of inflationary forces in the national economy.

During the first half of 1952, civilian employment in the executive branch of the federal government rose sharply. Total civilian employment increased from 2,518,137 at the end of Dec. 1951 to 2,603,288 at the end of June 1952—an increase of 85,151 employees. Of these, 1,337,000 were in the department of defense; another 524,000 were in the post office; and 174,000 were in the Veterans administration. These three government departments accounted for almost 80% of all federal civilian employees. (See also GOVERNMENT DEPARTMENTS AND BUREAUS.)

The increasing extent to which the United States was engaged in foreign aid and defense activities outside its boundaries was further reflected in the fact that 100,000 civilians on the federal

pay roll were located in foreign countries. Personnel problems resulting from these far-flung activities became the subject of special study by the United States civil service commission. One result of the study was a proposal by the commission in midyear to place overseas workers in the department of the air force under civil service.

In contrast with the growth in federal employment, the number of nonfederal public employees remained relatively uniform. At the same time, however, state and local government pay rolls continued the climb which began the previous year, caused by pay increases to offset mounting living costs.

Disclosures of irregularities and misconduct by certain federal officials and employees, particularly in the bureau of internal revenue, gave impetus to widespread criticism of public employees from many quarters. In an effort to offset the criticism, much of which sprang from misinformation, a move was launched under the leadership of Chairman Robert Ramspeck of the United States civil service commission to provide the public with accurate facts about government employment and government employees. This "truth about government" campaign received widespread support by newspapers and civic groups. It was further augmented by a program to improve government public relations initiated by the Civil Service assembly of the United States and Canada.

A plan proposed by Pres. Harry S. Truman to place United States postmasters, marshals and customs officials under civil service was rejected by congress during the year. The plan was one of several government reorganization proposals submitted by the president for congressional approval, and had previously been urged by the Hoover commission and the National Civil Service league.

Relatively few extensions of civil service took place during the year. In Louisiana the state legislature approved a proposed amendment to the state constitution to establish a civil service program for all state employees. The amendment, designed to restore the civil service program repealed by the legislature in 1948, was to be voted on by the electorate at the November elections.

The United States supreme court upheld the constitutionality of a New York statute which prohibited the employment in the public-school system of any person who advocates overthrow of the government by force or violence. The majority opinion upholding this law held that the state has a constitutional right to protect the minds of school children from subversive propaganda.

In Portland, Ore., the city council rejected a proposed charter amendment which would give city firemen the right to collective bargaining and arbitration in labour disputes with the city administration. In Cincinnati, O., the city council approved a policy statement outlining procedures to be followed in conducting negotiations with city employees. (See also MUNICIPAL GOVERNMENT.) (J. J. DN.)

Great Britain.—As a result of intensive efforts in all departments, the total number of staff in the civil service was reduced from 688,435 on Jan. 1, 1952, to 678,030 on July 1, a reduction of 10,405. In January an agreement was reached between both sides of the National Whitley council providing for a special addition to the pay of all nonindustrial civil servants on salaries of up to £2,000 a year. This settlement gave increases of 10% on the first £500 of remuneration, 5% on the second £500, 2½% on the third £500 and a total increase of £100 on salaries of between £1,500 and £2,000, and was in final settlement of all civil service nonindustrial wage claims based on movements in prices and wages in respect of the period up to Dec. 31, 1951.

In Jan. 1952 a new security procedure was introduced for

staff employed on exceptionally secret work, including work involving access to classified atomic energy information. This procedure involved open inquiries designed to establish the reliability of such staff and to carry out the government's policy that no person should be employed on work the nature of which was vital to the security of the state if he was a member of the Communist party, a fascist organization or associated with either in such a way as to raise legitimate doubts about his reliability. (E. E. Bs.)

Clark, Mark Wayne (1896—), U.S. general, was born on May 1 at Madison Barracks, N.Y. He graduated from the U.S. Military academy, West Point, N.Y., in 1917 and saw action in France as a battalion commander during World War I. He was graduated from the Command and General Staff school, Fort Leavenworth, Kan., in 1935 and from the Army War college, Washington, D.C., two years later. In Aug. 1942 he arrived in England to take over command of U.S. ground forces in the European theatre of operations, and in Nov. 1942 he was second in command of the U.S. forces in the North African invasion. Three weeks before the landings, Clark had led a successful secret mission by plane and submarine to establish contact with French officers in North Africa friendly to the Allied cause. For this feat he was promoted to lieutenant general. Subsequently he led the U.S. 5th army in the invasion of Italy in Sept. 1943, and in Nov. 1944 he was named commander in chief of the Allied 15th army group. After World War II Clark, who had advanced to the rank of full general (temporary), was U.S. high commissioner for Austria (1945-47), commander of the U.S. 6th army in San Francisco (1947-49) and commander of the U.S. army field forces at Fort Monroe, Va. (1949-52). In Oct. 1951 Pres. Harry S. Truman nominated him to be first U.S. ambassador to the Vatican, but after numerous protests the appointment was withdrawn at Clark's own request.

On April 28, 1952, President Truman appointed Clark supreme commander of U.N. forces in Korea to succeed Gen. Matthew B. Ridgway (*q.v.*). Clark took command on May 12 during the height of the Kojé prisoner of war disturbances, which were later successfully subdued. On July 4 he defined U.N. objectives in the Korean war as "establishment of . . . the equality of nations and the . . . right of all men to life, liberty and the pursuit of happiness."

Clay Products: see CERAMIC PRODUCTS.

Cleveland. Cleveland, O., had a population of 914,808 by the federal census of 1950. Its area is 73.1 sq. mi. Ground was broken Feb. 4, 1952, for the city's \$26,000,000 municipally owned rapid transit line and by the close of the year more than \$10,000,000 of the work was under way.

The city council on April 28 approved fluorination of Cleveland water, increased the pay of councilmen \$1,000 to \$5,000 a year on June 16, placed on the ballot a \$54,000,000 capital improvement bond program and five charter amendments on Sept. 2 and on Sept. 22 extended rent controls until April 30, 1953, but recommended that rent increases of 10% to 15% be permitted.

Teachers and other salaried employees of the Cleveland board of education were granted a \$175 cost-of-living increase on Jan. 28 and on July 28 the board established minimum annual pay for teachers at \$3,500 and set its 1953 budget at \$32,864,821, dependent upon passage of a 9.5-mill levy. Enrolment in Cleveland public schools (March 1952) was 101,189.

Commissioners of Cuyahoga county, of which Cleveland forms a major part, named Budget Commissioner John F. Hehir county administrator as the first step in reorganizing the county govern-

ment. The commissioners put on the ballot a \$4,400,000 bond issue for a county administration building and adopted a provisional operating budget of \$30,488,498 for 1953. The county's new \$5,000,000 Sunny Acres hospital for tuberculosis patients was dedicated Aug. 21. Tax collection in the county in 1952 was \$82,091,437, the largest in 25 years.

The United States bureau of roads in July approved construction of a \$32,000,000 inner belt bridge across the Cuyahoga river valley. Announcement of a 900-unit, \$9,000,000 project in the southeast sector of the city was made by the Metropolitan Housing authority. Mayor Thomas A. Burke was authorized by the city planning commission to proceed with plans for lease of the mall in the centre of the city for private construction of a 1,000-car garage under it. Work began on the \$32,-856,000 supersonic wind tunnel of the Lewis Flight Propulsion laboratory at Cleveland Hopkins airport. (P. Bv.)

Climate: see METEOROLOGY.

Clothing Industry. The United States clothing industry (men's, women's and children's apparel), continued in the doldrums during the first half of 1952, making little progress from the poor record of 1951. The consequences of overproduction, accompanied by reduced consumer buying caused by high prices, were still evident in the form of lowered production and reduced employment.

In men's wear, factories were operating at only 70% of capacity during the first half of the year, compared with a normal of 85% to 90%. Production of suits declined by 19% compared with the same period of 1951, according to the bureau of the census. The emphasis in men's outer garments, suits, trousers, sport coats and slacks, was in lightweight sport or leisure coats and in slacks. In sportswear garments, rayon was becoming increasingly important. More than 15,000,000 pairs of separate trousers were made in rayon and only 6,700,000 pairs were made in wool, whereas five years before, the proportion had been the opposite.

Production of men's shirts declined during the first half of 1952 compared with the same period of 1951, but this was caused by the decline in dress shirt demand. Sport shirts were outselling dress shirts in a two-to-one ratio.

In men's suits, the use of dacron blends, all-rayon suits and cords for lightweight summer wear was growing, with a consequent decline in the all-wool tropical worsteds. Blends of man-made fibres and wool, such as dacron and wool, orlon and wool, etc., were becoming increasingly popular in both men's and women's wear. The increase in the sport coat from 800,000 garments cut in 1940 to nearly 8,000,000 in 1952 shows clearly the tremendous increase in consumer interest in informal garments.

In the women's apparel field the first half of the year was bad. The retailers still had inventories of merchandise they had bought the year before in anticipation of a price rise, which the consumers refused to buy because of high prices.

SUMMER RUSH PERIOD for cutters and other workers of the women's garment industry in New York city as 1952 fall fashions were prepared for the showroom. A designer is shown draping a cocktail dress

However, with production lower in most items of women's wear, by the end of the summer, conditions pointed to a fairly good business for the fall and excellent business for the spring of 1953.

In Great Britain, France, Italy and, in fact, most European countries, as well as in South Africa, Australia and New Zealand, the apparel industry was in a most depressed state during the first half of 1952. The basic reason was that the price of raw wool had risen nearly 200% within six months after the start of the Korean war. All countries bought heavily. Then the bottom dropped out of the wool market in June and July 1951. Stocks were extremely heavy, prices declined to pre-Korean levels and in the face of such uncertainty the clothing manufacturers refused to buy, as did the retailers. All waited for the price of wool to stabilize, which it did during mid-1952. At the same time, rayon fabrics and cotton goods reached price levels that compared favourably with pre-Korean levels. Toward the close of the year stocks were normal, prices reasonable, and with consumer demand good, prospects for 1953 seemed excellent. (See also WOMEN'S FASHIONS.) (H. A. Cn.)

Coal. Except for 1949, world coal production had been increasing from the low of 1945. Table I shows the outputs of countries which produce more than 10,000,000 tons a year, as reported by the U.S. bureau of mines. In 1950 the countries

listed accounted for 98% of the world total, and the four major producers supplied 73% of the total.

United States.—The salient features of the coal industry of the United States are shown in Table II, and the production by states in Table III, both as reported by the U.S. bureau of mines.

Total coal production in 1951 was 4% greater than in 1950 but was still 16% under the high of 1947. In 1952 the production trend for bituminous coal was downward during the first half, but picked up after the midyear work holiday, only to be cut back again by a "memorial" holiday in August. Production sagged again in September and early October, as is usually the case during contract negotiations, and as a result, production to Oct. 18 totalled only 371,270,000 tons, or 12% less than in the same period of 1951.

In the anthracite fields, production was less irregular and relatively somewhat better, as the output to Oct. 18 was 30,802,000 tons or 7.5% less than in the same period of 1951.

Canada.—Coal production suffered a slight decline, from 19,139,000 tons in 1950 to 18,589,000 tons in 1951. (G. A. Ro.)

Great Britain.—The production of deep-mined coal in 1950 was 204,100,000 metric tons and of opencast coal 12,200,000 metric tons, making a total of 216,300,000 metric tons. For 1951 the totals were: deep-mined coal 211,900,000 metric tons and opencast 11,000,000 metric tons, a total of 222,900,000 metric tons. The coal situation in Great Britain improved in several respects during 1952. The total output, the distributed stocks and overseas exports were all higher than in 1951 and there was also a marked improvement in the recruitment of labour for the mines.

A higher proportion than usual of the new entrants were juveniles and, for the first time in many years, the upward trend in the average age of the miners was checked. The total number

SKI HOIST adapted for use by coal miners in 1952, at the no. 14 mine of U.S. Steel near Gary, W.Va. Miners are shown being carried by chain belt seating from the lower portal to the bath house above

of workers on colliery books at the end of 1951 was 698,000.

Despite the improvements referred to, it was estimated that the total output in 1952 fell short of the true requirements by about 20,000,000 tons because the real demand for coal in Great Britain since World War II had been masked by statutory restrictions on supplies. The government Committee on National Policy for the use of Fuel and Power Resources, under the chairmanship of Lord Ridley, reported in September that production from the mines was unlikely to be sufficient to meet the real demand within the next decade, even with a vast expenditure of capital in the coal fields; they, therefore, recommended that steps should be taken immediately to conserve fuels by every means that might lead to greater efficiency in the utilization of heat and power.

In 1951 the National Coal board sustained a loss of £5,500,000 on the sale of 1,200,000 tons of coal imported from the United States to home consumers at the normal controlled prices and, as a result of this, it started operations in 1952 with a net deficit of £1,800,000.

The capital expenditure on new developments in 1951 was £26,500,000. The National Coal board estimated that £38,000,000 would have to be spent every year from 1951 to 1955 if all the proposals in the plan for coal were to be carried out. Some of the more important technical developments were proceeding on the lines suggested by the Reid committee, particularly in connection with skip winding and the layout of mine workings on the horizon system to enable locomotives to be used for main haulage. About 460 locomotives were at work at the end of 1952, of which 400 were of the diesel type and about 60 of the electric battery type.

Western European.—The Ministerial Coal Production group of the Organization for European Economic Cooperation (O.E.E.C.) met in London on July 28 to review the production and consumption figures for the immediate future and to discuss the financing of investments in the coal industry in France, Germany and Belgium. The production figures for 1952 and 1953 were predicted from data supplied by the various governments concerned and, as was anticipated, they were exceeded in 1952 in Great Britain and western Germany. Under the O.E.E.C. five-year plan for the German Federal Republic, the aim was to raise the output of hard coal to 150,000,000 metric tons a year by 1956. (See also LABOUR UNIONS.) (J. A. S. R.)

Coast and Geodetic Survey, U.S. During 1952, this bureau of the department of commerce performed a wide variety of essential services for the advancement of marine, aviation, commercial and industrial interests of the country. The impact of the Korean conflict and the military preparedness program continued to be reflected in almost all phases of the bureau's work. There was a steadily increasing demand for charting services and for acceleration of the mapping program in areas of strategic importance, particularly in western Alaska.

Seventeen ships and two shore-based parties were engaged along the Atlantic, Gulf and Pacific coasts, and in Alaska making surveys and collecting basic data for new nautical charts and for modernizing existing ones. These included inshore hydrographic surveys, oceanographic surveys and special tide and current surveys.

High priority was given to the work in Alaska. Electronic-controlled hydrographic surveys were extended in the Bering sea and along the south coast of the Alaskan peninsula and combined operations were carried on in southeast Alaska and along the Arctic coast. More extensive use was made of the electronic position indicator system for the control of hydrography in the Bering sea. Used together with the Shoran system, the two provided economical and highly effective methods of offshore hydrographic surveying, particularly in areas where fog or inclement weather existed for a good part of the working season.

Major emphasis was also placed on extending the geodetic network in western Alaska to meet the needs of the department of defense. In the United States the network of control was extended to various priority areas for use by the federal agencies and others engaged in mapping and engineering work. A program of astronomic work in the Bahama Islands area was initiated in connection with guided missile experiments by the air force.

Photogrammetric mapping was extended along coastal areas of the United States and in Alaska. Aerial photographs were taken primarily with the bureau's nine-lens camera for basic mapping purposes. Seventy-eight airports in the United States were photographed for use in preparing airport obstruction plans.

Observations of the rise and fall of the tide at principal sea-ports were continued as part of a comprehensive and long-range tidal program. Special tidal current surveys were in progress in Chesapeake bay, San Francisco bay, New York harbour and Puget sound. Temperature and density of sea water data were obtained at 138 tide stations in the United States and other countries, and the results were published in a series of four volumes.

The magnetic survey of the United States was carried forward to provide additional information on the magnetic elements for navigators, for surveyors and engineers using compasses and for various scientific purposes. There was a steady

and increasing demand for such data. Observations were made at 33 new field stations and 43 repeat stations and at 7 observatories. Construction of a new observatory and laboratory at the A. P. Hill Military reservation in Virginia was authorized by congress to replace the outmoded observatory at Cheltenham, Md.

Seismologic work was directed toward mapping areas of potential danger and the analysis of destructive earthquake motions. The locations of more than 600 earthquakes were determined during the year based on reports received from co-operating stations in the U.S. and abroad. As part of the bureau's engineering seismology program, 67 strong-motion seismographs were operated in 5 states of the western seismic region. The most outstanding United States recording of the year, from the standpoint of damage and public interest, was the Arvin (Tehachapi), Calif., earthquake, which occurred on July 21, 1952.

More than 40,000,000 nautical and aeronautical charts were published, requiring the printing of nearly 93,000,000 impressions. The program of charting the Gulf Intracoastal waterway, begun several years earlier, was completed during the year. This series comprised 33 charts extending from Carrabelle, Fla., to Brownsville, Tex., and was similar in design to the Atlantic Intracoastal waterway charts. A total of 772 nautical charts and 1,191 aeronautical charts were available in different series to meet the various needs of marine and air navigation. (See also CARTOGRAPHY; GEOGRAPHY; OCEANOGRAPHY; SEISMOLOGY.) (R. F. A. S.)

Coast Guard, U.S. During the fiscal year ending June 30, 1952, personnel and activities of the U.S. coast guard were increased moderately to meet, in part, the military requirements for search and rescue facilities in Atlantic and Pacific overseas areas, to provide additional port security coverage and a higher degree of military readiness.

In addition to the general enforcement of federal laws on the high seas and territorial waters, the coast guard assisted other government agencies in enforcement of the Oil Pollution act, anchorage regulations, laws pertaining to internal revenue, customs, immigration, quarantine, and the conservation and protection of wildlife and fish. An example of this assistance was the location of 190 illicit distilleries by coast guard aviation personnel. Their discovery was estimated to have prevented the loss of \$119,263 in revenue.

For search and rescue operations the coast guard maintains an established organization of surface craft, aircraft, lifeboat stations, bases and radio stations, communication centres and rescue co-ordination centres. During the year the coast guard responded to 15,555 calls for assistance and rescued from peril or saved the lives of 5,855 persons. Disabled vessels towed to port numbered 6,203. The value of vessels and aircraft assisted (including cargo) was \$319,721,552.

For example, on Jan. 9, 1952, the U.S. freighter "Pennsylvania" foundered 665 mi. W. of Cape Flattery, Wash. In heavy seas, the coast guard used all the facilities in the area at its command, plus the co-ordinated use of navy, air force and Royal Canadian air force facilities. A fruitless search for the 45 men who had abandoned ship in lifeboats was made by 51 aircraft and 18 surface vessels.

On Feb. 18 the merchant ships "Fort Mercer" and "Pendleton" broke in half during a heavy storm off the New England coast. Coast guard vessels and aircraft and lifeboat stations removed 62 persons from the floundering ships or from the water; 14 crewmen were drowned.

Seventeen persons were rescued April 11 from a commercial aircraft which had crashed off the harbour of San Juan. On April 7 the coast guard went to the relief of flooded areas

LAST SURVIVOR from the broken tanker S.S. "Fort Mercer" being towed on a rubber life raft to the coast guard cutter "Yakutat" off Cape Cod early in 1952

along the Mississippi and its tributaries. Using small boats, mobile radio stations, automotive equipment, helicopters and fixed-wing aircraft, the coast guard evacuated stranded persons and livestock, transported relief supplies and personnel engaged in levee protection and generally assisted local, state, civil and military authorities and the Red Cross.

The annual International Ice patrol in the North Atlantic was conducted from February 13 to June 16 by cutters and by aircraft operating out of Argentia, Nfld.

The annual Bering sea patrol was carried out by the cutter "Northwind" from June 4 to August 5, 1951. The "Northwind" cruised 12,460 mi., carried 26 passengers and transported 261 tons of freight and fuel oil for government agencies, assisted one vessel and rendered medical or dental treatment to 739 persons.

Ships of ocean (weather) stations provided search and rescue, communications, air navigation facilities and meteorological service in areas traversed by the United States and other co-operating governments. They transmitted 61,488 weather reports, made 52,080 radio contacts with aircraft, rendered assistance to 35 cases and cruised 807,912 mi. The coast guard operated five stations each in the North Atlantic and the Pacific. One other Atlantic station was maintained by the coast guard two-thirds of the time, with the Netherlands operating it the remaining third.

A total of 37,838 aids to navigation were maintained in continental and territorial waters and at overseas military bases. During the year 929 new aids were established and 882 discontinued. The coast guard operated 36 Loran stations supplying long-range navigational service to aircraft and ships.

During the year no passenger lost his life as a result of casualties on inspected and certified U.S. passenger vessels.

The merchant marine council of the coast guard continued its support of the International Convention for the Safety of Life at Sea, whose ratification was considered to be one of the im-

portant accomplishments of the year. This agreement established many new safety equipment requirements for passenger and cargo vessels of 500 gross tons and over which were engaged in international trade.

Marine casualties during the year totalled 2,879, of which 2,072 received detailed investigation. There were 312 lives lost in '86 marine casualties, and ten vessels of more than 1,000 gross tons were lost.

In the port security program 304,191 longshoremen, warehousemen, pilots, waterfront workers and persons to be employed on merchant vessels were screened to determine whether they were security risks. In the fiscal year, 170,328 merchant mariners' documents and 188,301 port security cards were issued.

At the end of the year larger vessels consisted of 192 cutters of various types, 62 patrol boats, 36 lightships, 42 harbour tugs and 10 buoys, an increase of 14 vessels over the previous year. They cruised 3,216,617 mi. compared with 2,742,949 the year before. Included among the cutters was the "Courier," a 339-ft. vessel which was operated as a floating relay station for Voice of America broadcasts. In addition, the coast guard had in operation 262 motor surfboats, 177 motor lifeboats, 1,254 miscellaneous motorboats, 1,966 nonpowered boats and 75 barges.

Aircraft in operation included 113 fixed- and rotary-wing craft which flew 10,664 sorties for a total of 29,185 hr. Twenty new aircraft were acquired to replace overage equipment.

The military personnel strength on active duty was 3,151 commissioned officers, 459 commissioned warrant officers, 357 cadets, 479 warrant officers and 30,636 enlisted men as compared with 25,375 enlisted men in 1951. The authorized force of civilian employees was 2,467 salaried personnel, 3,366 wage-board employees and 595 part-time lamplighters. Commissioned officers increased by 519 during the year. Seventy-seven cadets were graduated from the U.S. Coast Guard academy, New London, Conn., and commissioned as ensigns. In the annual competitive examination for appointment as cadets, 487 of the 1,425 candidates received passing grades and 225 were selected for the class of 1956.

Of 20,940 men who applied for enlistment, 9,126 were accepted, 3,558 were rejected physically and 6,959 for other reasons.

The U.S. public health service provided 82 officers for coast guard duty as follows: 34 medical officers, 38 dental officers, 9 nurses and 1 scientist.

Port security training was a major program, with 42 organized reserve training units in operation with 268 officers and 2,849 enlisted men in paid drill status. Reserves on inactive duty numbered 9,295, of whom 2,588 were commissioned and 6,707 enlisted.

The civilian auxiliary in 151 communities had 12,804 members and 7,596 facilities; the primary activity of the auxiliary was to promote safety in the operation of small boats. (M. O'N.)

Cobalt: see MINERAL AND METAL PRODUCTION AND PRICES.

Cochin-China: see INDOCHINA.

Cocoa (CACAO). Primarily as a result of unfavourable weather conditions in the major producing areas of Africa and Latin America and black pod disease on the Gold Coast, world output for 1951-52 was revised downward to 1,483,000,000 lb., compared with earlier prospects of 1,672,000,000 lb. Per capita consumption in the U.S. in 1952 was estimated at four pounds—the same as in 1951. Prices near the ceiling apparently discouraged consumption. Spot prices near 33 cents per pound in the autumn were about 5 cents below the ceiling and future prices for delivery in the spring of 1953 were

World Cacao Production by Leading Areas

Area*	In thousands of pounds		Average 1935-36 to 1939-40
	1952-53	1951-52	
Gold Coast	537,000	480,000	609,363
Brazil	206,000	230,900	263,980
Nigeria	240,000	230,000	216,318
French West Africa	97,000	109,937
French Cameroun and Equatorial Africa	111,330	60,221
Dominican Republic	53,000	54,049

*Some countries named include production of smaller near-by producers.

as low as 26 cents per pound. The 1952-53 crop was estimated as high as 744,000 tons, 11% more than the previous year. The West African Central Marketing board began purchases late in September. Some Gold Coast producers served notice they would no longer sell through those channels. (J. R. K.)

Coffee. The average U.S. civilian used an estimated 16.4 lb. of coffee in 1952, the same as in 1951, but 17% more than the 14-lb. pre-World War II average.

The 1952-53 world coffee crop was unofficially and preliminarily indicated at 5% to 10% above the revised estimate of 37,600,000 bags (of 132 lb.) in 1951-52, which was slightly below the 38,200,000 bags of 1950-51. However, the exportable supply from the 1951-52 crop was revised downward by 9% to 29,300,000 bags, compared with 30,100,000 bags in the previous year. World coffee exports, 16% above prewar, in 1951 were 31,700,000 bags, 16,400,000 from Brazil and 4,800,000 bags from Colombia. The U.S. took about two-thirds of the total,

Exportable Coffee Production of the Principal Producing Countries

Country	In thousands of bags—132 lb. each		Average 1935-36 to 1939-40
	1951-52	1950-51	
Brazil	15,800	15,550	21,740
Colombia	5,700	4,500	4,202
Mexico	1,010	900	609
Guatemala	900	800	922
El Salvador	890	1,112	1,011
French West Africa	790	700	207
Angola	665	775	273
Uganda	660	650	222

whereas Europe, which had taken about 43% of the total prewar, took only 26% in 1951. Imports into the U.S. in 1952 were lower than in 1951, until exceptional arrivals in September of 1,790,000 bags were spurred by fear of a dock strike. Coffee prices in 1952 fluctuated in a narrow range just below U.S. ceilings, the Office of Price Stabilization having decided that coffee was not a fresh or processed fruit or vegetable, so not exempt from price control. Brazil decreed a minimum price of about 52 cents per pound for the 1952-53 crop and prepared to finance the crop at 80% of the minimum. Britain abolished price controls on coffee in August. Powdered coffee and some other derivatives made further progress in consumption during the year. (J. K. R.)

Coinage. The three U.S. coinage mints located at Philadelphia, Pa., San Francisco, Calif., and Denver, Colo., manufactured a total of 1,447,993,922 domestic and foreign coins during the government fiscal year 1952.

United States coin production was valued at \$74,736,479.70 and consisted of the denominations given in the table.

The composition of the half dollars, quarter dollars and dimes was 90% silver and 10% copper; five-cent pieces, 25%

Table I.—U. S. Coin Production, 1952

Denomination	Number of pieces produced
Half dollars	40,694,918
Quarter dollars	87,908,402
Dimes	191,096,602
Five-cent pieces	56,845,500
One-cent pieces	1,045,998,500
Total domestic	1,422,543,922

Table II.—Coins Manufactured for Other Governments

Government	Number of Pieces
Costa Rica	3,000,000
Dominican Republic	6,100,000
El Salvador	13,000,000
Honduras	3,000,000
Syria	350,000
Total foreign	25,450,000

nickel and 75% copper; and one-cent pieces, 95% copper and 5% zinc and tin, in conformity with U.S. coinage laws.

Coins of various alloys and denominations were manufactured for five other governments, as shown in Table II.

In addition to the coinage mints, four other mint service institutions comprising the bureau of the mint were in operation in 1952—the assay offices at New York city and Seattle, Wash., the gold bullion depository at Fort Knox, Ky., and the silver bullion depository at West Point, N.Y. The entire mint service is administered by the director of the mint, with offices in Washington, D.C.

The principal functions of the bureau of the mint, other than the manufacture of domestic and foreign coins, include the safeguarding of the government's holdings of monetary metals; acquisition of gold and silver bullion; the refining of gold and silver; administration of the issuance of treasury licences for the acquisition, ownership, possession, use and exportation of gold for industrial, professional and artistic purposes; production of medals and other decorations.

At the close of the fiscal year 1952 the mint institutions held in their custody 68,400 tons avoirdupois of gold and silver bullion valued at \$25,000,000,000. (N. T. R.)

Coke. World production of coke increased each year after the postwar low of 1945, and in 1950 and 1951 outstripped the war peak of 1943. The countries listed in Table I account for about 95% of the world total, as reported by the U.S. bureau of mines.

Table I.—World Production of Coke*

	(Thousands of short tons)

United States.—Defense requirements boosted the 1951 coke production to a new record high that exceeded the previous 1948 record by 6% and the 1944 war peak by 7%.

The cutback in operations during the steel strike reduced output during the second quarter of 1952, with the result that the total for the first nine months of the year was 48,789,625 tons, as compared with 59,287,500 tons in the same period of 1951. (G. A. Ro.)

Coldwell, Major James (1888—), Canadian politician, was born at Seaton, Eng., Dec. 2, educated at University college, Exeter, and migrated to Canada in 1910. He spent 20 years as an educationist in Regina, Sask., during the latter years as school principal. From 1922 to 1932 he sat on the Regina city council. He joined the Saskatchewan Farmers Political association, and was provincial leader of the Saskatchewan Farmer-Labour party, 1932-35. In 1935 he won the federal riding of Rosetown-Biggart (Sask.) for the Co-operative Commonwealth (Socialistic) federation, and held it at the 1940, 1945 and 1949 elections. In 1942 Coldwell became president of the C.C.F. In the 1940-52 period, despite heavy parliamentary responsibilities, he was very active in international affairs.

During 1952 Coldwell sharply criticized the disproportionate ratio between the military and economic resources employed in the defense of the free world against Communism. He urged Canada in co-operation with the United States to implement article II under the North Atlantic Treaty organization by providing greater economic aid to bolster the economies of western Europe in the face of pressures resulting from defense programs. He urged greater use of the Colombo plan, the U.S. Point Four program and the United Nations Technical Assistance program to wage war on poverty in the underdeveloped areas of the world, and made a nation-wide appeal to all Canadians to sign a petition calling upon the federal government to initiate, in co-operation with the provincial governments, a comprehensive health insurance program. (C. Cy.)

Colleges and Universities: see UNIVERSITIES AND COLLEGES.

Collins, J(oseph) Lawton (1896—), U.S. army chief of staff, was born on May 1 in New Orleans, La., and entered the U.S. Military academy at West Point, N.Y., in 1913. After World War I he served with the occupation forces in Germany until 1921, when he began a four-year period as an instructor at West Point. Early in World War II he was given duty in the Pacific, and he won the nickname of "Lightning Joe" in the recapture of Guadalcanal. Assigned to Europe in 1943, he led the U.S. 7th corps in the invasion of France, the capture of Cherbourg, the break-through at St. Lô and the liberation of Belgium, and finally to the Elbe. He was named deputy chief of staff in 1947, vice-chief of staff in 1948 and chief of staff, U.S. army, Aug. 1949.

Following the dismissal of Gen. Douglas MacArthur in 1951, General Collins testified before a joint U.S. senate armed services and foreign policy committee that MacArthur's dispatching of U.S. troops to the Manchurian frontier had been a violation of a "clear-cut objective" to let only South Korean troops go all the way. He said the chiefs of staff had agreed that MacArthur should be removed to prevent "more serious" violations of policy.

During an inspection tour of Korea in 1952, Collins declared at Seoul on July 14 that there was no possibility that the Chinese Communists could drive U.N. forces from Korea. He threatened retaliation with "other means," presumably atomic warfare, if the reds should launch an all-out offensive.

Colombia. A republic situated in northwestern South America adjoining the isthmus of Panamá, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area: 439,714 sq.mi.; pop. (1950 census of the Americas): 11,266,000. Approximately 68% of the population is classified as mixed blood, 20% as "white," 7% as Indian and 5% as Negro. Most Colombians live in the highlands and moun-

tain valleys of the interior. The capital is Bogotá (1947 pop.: 482,480). Other major cities are Barranquilla (225,430), Bucaramanga (71,240), Cali (147,160), Cartagena (106,820), Cúcuta (77,480), Ibagué (84,840), Manizales (117,760), Medellín (237,220), Neiva (39,490), Pasto (63,430), Popayán (35,960), Santa Marta (43,950) and Tunja (27,080). Language: Spanish. Religion: predominantly Roman Catholic. Presidents in 1952: technically, Laureano Gómez; but on an interim basis, Roberto Urdaneta Arbeláez.

History.—In Nov. 1951 President Gómez, leader of the extreme right wing of the Conservative party, withdrew for reasons of health from the active exercise of his office, and Minister of Government Urdaneta Arbeláez assumed the presidential duties pending Gómez' return. Constitutional guarantees remained suspended and censorship continued in force throughout 1952. On May 13 an information and propaganda office was established to co-ordinate the government's propaganda activities. On the economic front, official policy reflected a progressive tightening of controls, particularly restrictions on imports and exports. A National Economic Planning board was created in May to advise the executive on economic matters; and an Administrative Council of National Railways was set up on June 8 to reorganize rail transportation along more efficient lines. Former Pres. (1946-50) Mariano Ospina Pérez, leader of a conservative faction rivalling that of Gómez, resumed political activity in July. Many Conservatives supported the former president for re-election in 1954 in the belief that his return to office would offer promise of peace with the opposition Liberal party, which pursued a policy of political abstention throughout 1952.

Negotiations were completed on Aug. 12 for a loan from the International Bank for Reconstruction and Development to Colombia of \$25,000,000, of which \$20,000,000 would be designated for construction of the projected Magdalena River railroad. A military aid pact was signed with the U.S. on May 17. At the end of the year Colombia remained the only Latin American state with armed forces participating in the Korean conflict. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (G. I. B.)

Education.—In 1948, 13,010 public and private primary schools had 765,482 pupils and 17,849 teachers. There were 601 high schools with 42,293 pupils, 153 commercial schools with 5,914 pupils, 347 night schools with 8,904 pupils and 76 normal schools with 4,411 pupils. University faculties totalled 74 in 1950, with 9,991 students and 1,590 teachers. Only 7% of the 1952 budget was earmarked for education.

Finance.—The monetary unit is the peso, valued at 39.84 cents U.S. currency, basic rate, on Sept. 30, 1952. Actual revenue in 1951 totalled 733,376,852 pesos; expenditure, 685,625,038 pesos. The 1952 budget balanced revenue and expenditure at 632,700,000 pesos. The public debt amounted to 567,055,667 pesos on Dec. 31, 1951. Currency in circulation on Sept. 30, 1952, totalled 490,000,000 pesos; demand deposits 776,000,000 pesos; time deposits 75,000,000 pesos; government deposits 123,000,000 pesos; gold reserves (June 30, 1951) U.S. \$67,000,000; dollar exchange in U.S. banks (Aug. 31, 1952) \$87,000,000. The cost of living index (Bogotá) stood at 133 in Sept. 1952 (1948=100).

Trade and Communications.—Exports in 1951 totalled 1,093,000,000 pesos; imports, 872,068,000 pesos. Leading exports were coffee (78%), petroleum (16%), bananas (2%) and sugar (2%). Leading customers were the U.S. (81%), Germany (6%), the Netherlands Antilles (5%) and Canada (2%). Important suppliers were the U.S. (69%), Germany (8%), the United Kingdom (5%), Canada (2%), Belgium (2%) and France (2%).

In 1947 there were 2,208 mi. of railroad and (1948) 11,166 mi. of improved highways. Motor vehicles (Dec. 31, 1950) included 36,374 automobiles, 23,763 trucks and 7,380 buses. Cargo received at ports on the Magdalena river in 1951 totalled 1,572,650 metric tons; passengers numbered 183,933.

Agriculture.—Coffee production in 1951 totalled 5,576,640 bags of 132 lb. each, of which 4,798,518 bags were exported, 4,311,009 bags to the U.S., 231,605 to Germany and 111,927 to Canada. Banana exports were 6,347,690 stems of which 4,776,414 stems went to the U.S. and 1,516,564 to Germany. In the 1951-52 crop year, 127,000 metric tons of wheat, 318,000 tons of rice (rough) and 490,000 tons of potatoes were produced. Sugar production (1951) included centrifugal 147,470 metric tons and panela 646,500 tons. In 1950 there were an estimated 15,200,000 cattle, 2,470,000 pigs, 531,000 goats and 1,339,000 sheep.

Manufactures.—The leading industries were foodstuffs, textiles and beverages. Production figures in 1951 included cement 648,131 metric tons and electric energy 742,712,000 kw.hr.

Mineral Production.—Production figures in 1951 included gold 430,723 troy oz.; silver 129,773 oz.; platinum 17,157 oz.; and salt 110,085 metric tons. Crude petroleum production was 38,398,000 bbl. Crude exports were 32,236,969 bbl., of which 16,740,078 bbl. went to the U.S. and 11,510,496 bbl. to the Netherlands Antilles (for refining). Refined products included 1,986,347 bbl. of gasoline.

BIBLIOGRAPHY.—Dirección Nacional de Estadística, *Boletín Informativo*; Banco de la República, *Revista*.

Colorado. A Rocky mountain state of the United States, in the west central part, Colorado has a mean elevation above sea level of 6,800 ft., the highest of any state. Admitted to the union in 1876 as the 38th state, it is known as the "Centennial state." The area of 104,247 sq.mi. includes 325 sq.mi. of water surface. The U.S. owns 34.5% of the total land area and 59.3% is in private ownership, the remainder belonging to state, county and municipal governments.

Population (1950) 1,325,089; 62.7% urban, 37.3% rural; 93.4% native white; 4.5% foreign-born white; 1.5% Negro; .6% other. As of July 1951 the U.S. census bureau reported a population of 1,376,000. Capital, Denver, pop. (1950 census) 415,786. Other cities (1950 census) Pueblo, 63,685; Colorado Springs, 45,472; Greeley, 20,354.

History.—The second regular session of the 38th assembly convened Jan. 2, 1952, and adjourned Feb. 9, 1952. Outstanding laws enacted included: a public school finance act, a comprehensive far-reaching rewriting of all school finance laws, and the distribution of state financial aid; reorganization of the state highway commission, giving its members more responsibility and authority; more stringent penalties on narcotic law violations; taxation of co-operatives, similar to the federal act. Colorado was the first state in the union to enact such a statute.

The principal state officers as a result of the 1952 elections were: Daniel I. J. Thornton, governor; Gordon Allott, lieutenant governor; Homer M. Bruce, secretary of state; Homer F. Bedford, treasurer; Duke W. Dunbar, attorney general; Earl E. Ewing, auditor. Republicans occupied all but one of the major state offices. Burtis E. Taylor was acting commissioner of education.

Education.—The state appropriation for education in the public schools for 1952-53 was \$12,500,000. The average current expense per pupil in average daily attendance was approximately \$250; the average daily attendance was approximately 211,000 during 1951-52. The school population, including persons 6 to 21 years of age, amounted to 316,200 in 1952. A total of 10,705 teachers and administrators were employed in the Colorado public schools during 1951-52.

During the fiscal year 1950-51 the 132 county and municipal libraries in Colorado loaned more than 4,000,000 books, films, recordings and other library materials to their patrons.

Social Insurance and Assistance, Public Welfare and Related Programs.—Disbursements for welfare purposes for assistance and administration in 1951 amounted to \$60,436,079.36. Of this amount, \$45,953,413.78 was expended for old-age pensions, including burials; \$5,980,552.31 for aid to dependent children; \$286,880.72 for aid to the blind for awards, treatment and burials; \$3,548,223.68 for general assistance; \$540,121.02 for tuberculosis hospitalization, including outpatient care and burials; \$251,104.38 for child welfare; \$1,162,118.85 for aid to the needy, including burials; and \$2,713,664.62 for state office and county administration expenses. Federal participation during 1951 in money payments under the old-age pension, aid to dependent children, aid to the blind, and aid to the needy disabled programs, and in administration of these programs, amounted to \$21,715,014.15.

The average monthly number of recipients receiving cash payments by program were as follows (computed on an 11-mo. period): for old-age pensions, 52,113 received an average of \$73.44; aid to dependent children, 14,941 received an average of \$33.46 per child; 359 aid to the blind cases received an average of \$59.89; aid to the needy disabled, 2,188 cases received an average of \$48.29.

Communications.—Highways (state and federal) in 1951 totalled 75,589 mi. Total funds disbursed for highways in 1951 amounted to \$21,842,998. Improved roads totalled 23,365 mi., unimproved roads 52,224 mi.

Registered motor vehicles in 1951 numbered 622,294. There were 36 bus companies serving the state, and 14 steam (1 electric) railroads had a total railroad mileage within the state of 4,045. There were five scheduled air lines serving the state; one exclusively air freight carrier, one intrastate flying service. There were 166 airports and landing fields operating, of which 61 were personal-use type fields.

Telephones in use on June 30, 1952, numbered 472,067. There were 34 standard AM radio stations and 3 FM stations, plus 1 educational FM station. There was one television station.

Banking and Finance.—As of Jan. 1952 there were 77 national banks and 73 state banks. Deposits in all banks at the close of 1951 totalled \$1,309,710,794.20. Clearings in Denver (1951) \$6,986,185,436.54; in

Table II.—Mineral Production of Colorado

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Clays	310,000	\$ 619,000	255,000	\$ 499,000
Coal	4,259,000	21,669,000	4,636,000	23,735,000
Coke*	805,000	?	730,000	?
Copper	3,000	1,307,000	2,000	947,000
Feldspar	66,000	329,000	68,000	341,000
Fluorspar	18,000	654,000	22,000	763,000
Gold (oz.)	130,000	4,564,000	103,000	3,592,000
Lead	27,000	7,292,000	27,000	8,486,000
Molybdenum	12,000	?	5,000	?
Natural gas (thousand cu.ft.)	11,168,000	436,000	8,490,000	443,000
Natural gasoline (bbl.)	217,000	584,000	152,000	463,000
Petroleum (bbl.)	23,303,000	59,420,000	23,587,000	60,150,000
Petroleum gases (bbl.)	169,000	289,000	189,000	281,000
Sand and gravel	5,154,000	3,940,000	4,751,000	2,965,000
Silver (oz.)	3,492,000	3,161,000	2,895,000	2,620,000
Stone	1,680,000	2,776,000	1,817,000	2,804,000
Zinc	46,000	13,000,000	48,000	11,830,000
Other minerals		34,525,000		19,939,000
Total		\$154,897,000		\$139,858,000

*Values for processed materials are not included in the totals.

†Value included with other minerals.

Pueblo \$158,106,393.92; in Colorado Springs \$169,759,061.04.

The cash balance in the treasury as of June 30, 1952, was \$56,967,365.59. Total revenue in the fiscal year ended June 30, 1952, was \$177,627,220.17. All expenditures, including functional services, debt services and transfers, amounted to \$175,888,093.10. There was no bonded indebtedness. Highway anticipation warrants totalled \$3,670,000. Outstanding warrants, cash and general revenue amounted to \$9,478,201.60. Investments, June 30, 1952, of \$41,947,913.10, plus a cash balance of \$56,967,365.59, made a total of \$98,915,278.69 in liquid assets. The state surplus at the close of the fiscal year, June 30, 1952, was \$21,000,000.

Agriculture.—The cash income from farm marketings in 1951 aggregated \$537,000,000, of which \$370,000,000 resulted from the sale of livestock and livestock products and \$167,000,000 from the sale of crops. Government payments made under specific agricultural conservation programs were not included nor was the value of products produced on the farm and consumed for the most part where produced or grown.

The number of cattle and calves on farms Jan. 1, 1952, was at a record-high level at 2,117,000 head. The number of stock sheep totalled 1,299,000 head. In addition to the number of stock sheep and lambs there were 625,000 head of sheep and lambs in dry feed lots being fattened for market. Hogs and pigs totalled 312,000 head.

Manufacturing and Industry.—The department of commerce estimate for the value added to Colorado manufactures in 1951 was \$340,795,000. There were 1,705 industries in the state, employing 92,608 in agriculture and 444,105 in nonagricultural establishments, or a total labour force of 536,713. Capital expenditures in 1951 for new plants and equipment totalled \$32,189,000. Salaries and wages totalled \$144,207,000.

Tourist travel in Colorado is the third largest industry in the state. In 1951 the income derived from 3,010,000 travellers was \$220,709,000. (P. A. E.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Colorado in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Colorado ranks first in the production of molybdenum and fourth in lead, and 20th in the value of mineral output, with 1.31% of the U.S. total.

Communism. Communism in 1952 continued and intensified its propaganda against the United States, which it presented as driving the world into a war against the U.S.S.R., which in turn was praised as the bulwark of peace, thwarting sinister plans of the capitalistic ruling classes. On the one hand, the Communist spokesmen insisted on the might

and invincibility of communism and its soviet Russian motherland; on the other hand, they stressed the growing danger of war. In the February issue of *Questions of Philosophy*, the official journal of the Institute of Philosophy of the Academy of Science of the U.S.S.R., an article by V. V. Nikolaev stressed, that even after the victory of socialism in the U.S.S.R., there

could be no "withering away" of the state until after the total liquidation of the "capitalist encirclement." The incessant strengthening of the army and intelligence services of the soviet state was needed in order to crush the "new aggressors." The U.S. government and its intentions were frequently compared with those of Hitler's Germany and a similar fate was predicted for the "new Hitlers." The "strategy of peace" against U.S. "war-mongering" was intensified; several peace congresses worked for that purpose in various countries, but the temper stressed by the Communist leaders was not that of pacifism but one of fervent and pitiless hatred against non-Communist or anti-Communist peoples. The Communist peace partisans opposed "unjust wars," *i.e.*, wars of which Joseph Stalin did not approve. On the contrary, they glorified wars for the "liberation from capitalism or imperialism."

In a long and important statement in the magazine *Bolshevik* on Oct. 2, Stalin predicted, however, that the next wars might not be fought between "the camp of capitalistic aggressors led by the United States" and the peace-loving Communist nations led by the U.S.S.R., but among the capitalist countries themselves. He expressed the conviction that Great Britain and France would soon resist the economic and political encroachment of U.S. imperialism on their sovereignty and their empires. He also suggested that Germany and Japan, "countries now squeezing out a pitiful existence under the heel of American imperialism," would try again to rise as independent world powers. Stalin reverted to the old Leninist thesis, that wars between capitalistic countries are inevitable and are rooted in their competition for markets and raw materials. Apparently Stalin did not believe in the growth and duration of the Atlantic union, which the Communists did their best to undermine.

The article by Stalin, which appeared simultaneously in pamphlet form in a first printing of 1,500,000 copies, was greeted by *Pravda* as "the greatest event in the ideological life of the party and the Soviet people." It was issued on the eve of the 19th congress of the Communist party of the U.S.S.R., the first congress held since March 1939. In his concluding address to the congress on Oct. 15, Stalin called upon all foreign Communist parties to support the U.S.S.R. and thus to serve the best interests of their native lands. He especially praised the pledges given by the Communist parties of France and Italy—whose leaders, Maurice Thorez and Palmiro Togliatti, were personally present—that their peoples would never fight in a war against the U.S.S.R. He exhorted the foreign Communists vigorously to defend democratic liberties in their own lands against their bourgeois governments and to insist upon the full sovereignty of their nations, a sovereignty threatened, according to Stalin, by these same bourgeois governments, which were selling it out "for dollars."

In his article, which was put in the form of answers to questions discussed a year before by soviet economists, Stalin maintained that the position of capitalism was rapidly worsening. On the other hand, the Communist lands, suffering under the trade restrictions imposed by the capitalist countries, would "soon" no longer need to import goods but would be able to export their own surplus production. This hopeful statement implied the acknowledgment that the strong and sustained efforts of the Communists to end the blockade had failed and that the Communist nations, especially China, would have to face in the future the lack of vitally needed machinery. In a comforting vision of the future, Stalin promised the soviet people an early transition to "communism," comprising the doubling of real wages, a five- or six-hour working day, and a product exchange system on collective farms which would end the selling of surplus products on the open market.

The congress also adopted several organizational changes.

The Politburo of 12 members was replaced by a Presidium of the Central Committee, which, though widened to 25 members, included practically the same personnel. This reorganization was apparently part of the stress on tighter party discipline, as ordered by the central committee of the party in the *Pravda* on Aug. 26. It reminded the party leaders of the need for extreme vigilance against dishonest conduct and against a number of abuses that had crept into party work.

Though Stalin's stand and the deliberations of the congress seemed to envisage no armed conflict between the United States and the U.S.S.R. in the near future, the "cold war" between the two countries reached a new pitch with Moscow's demand for the recall of United States ambassador George F. Kennan, who had assumed his position in the hope of effecting some improvement in the relationship between the two countries. The failure of the truce negotiations in Korea, which after 15 months still seemed far from successful conclusion, also militated against a relaxation of the tension between the Communist and the anti-Communist world. In imitation of the example set by Moscow, Communist China called an Asian peace congress to Peking to protest "American imperialist aggression" in Asia.

Within the U.S.S.R. much dissension was apparently caused by the growing emphasis on the leading role of the Russian nationality and its precedence over all the peoples inhabiting the vast Stalinist empire. While in the first decade of the soviet regime the equality of the various nationalities was emphasized and, at least outwardly, preserved, the U.S.S.R. began to assume a more and more outspoken Russian character after World War II. The drive against the nationalism of the non-Russian nationalities was intensified in the middle of 1951 and later grew in intensity and scope. The primary target of this attack against "bourgeois nationalism" was the Ukraine, but it was extended to virtually every nationality in the U.S.S.R., especially the Mohammedan peoples of central Asia. The central committees

PARIS POLICE confiscating bundles of the French Communist newspaper *L'Humanité*, in May 1952, after large-scale rioting against Gen. Matthew B. Ridgway who replaced Gen. Eisenhower as Supreme Allied commander in Europe.

of the various national republics, meeting in the spring and summer of 1952, subjected many high party officials and leading Communist writers and scholars of the various nationalities to very sharp criticism for failure to carry out measures to eliminate "bourgeois nationalist" faults and to improve the ideological content of scholarly and artistic activities. Many high ranking or renowned Communists among the non-Russian nationalities were removed from their positions. Many provincial and local committees were accused of insufficient ideological preparation of their leading groups. Many scholars and writers among the Mohammedan soviet peoples were criticized for their "cosmopolitan" pan-Islamic or pan-Turanian leanings and for their misrepresentation of the past of their peoples. While formerly the official Bolshevik party theory had represented the independence movements of the Mohammedan and other subject peoples against Russian tsarist imperialism as "progressive" efforts at liberation, the new official thesis emphasized that the subjection of these peoples by tsarist Russia carried with it "a deep progressive significance" for the non-Russian nationalities, and that the union, even with tsarist Russia, was always desired "by the progressive part" of native society.

This trend of Russification made itself felt not only among the non-Russian nationalities of the U.S.S.R. but also among the people's democracies in eastern Europe. Not only were the armed services and the economic systems of those countries assimilated to those of the U.S.S.R., but an ever greater emphasis was put upon the learning of the Russian language, the reading and glorification of Russian literature, and the re-interpretation of the national histories in the sense of extolling friendship with, and gratitude to, the U.S.S.R. Efforts of this kind were extended in 1952 to the German Democratic Republic, the soviet satellite of eastern Germany. Apparently greater independence was left to the Communist regime in China, because the Kremlin seemed concerned not to allow a repetition of the Titoist experience in Yugoslavia, though the Cominform (Communist Information bureau), which had seen its main task for the last four years in the fight against Tito's Yugoslavia, proved impotent to destroy or even to harm this chief heresy within the Communist camp. Titoism on the other hand showed insufficient strength in its efforts to spread outside Yugoslavia and to create an anti-Stalinist Communist movement, directed above all against Russian imperialism. There were in 1952 fewer reports on dissensions in the Communist parties outside the soviet orbit than in the preceding years. However, in France two important Communist leaders, André Marty and Charles Tillon, were demoted in the early fall and were accused of differing with the party line regarding the role of the U.S.S.R. and of the secretary general of the French Communist Party, Maurice Thorez, whose "unconditional and indefectible attachment to the Soviet Union" was praised at the same time. In the United States, the issue of communism and above all of Communist infiltration into governmental and other crucial positions continued to occupy public attention. The United States district court in Los Angeles, Calif., after a trial of six months, found 14 Communist party leaders guilty of conspiring to teach and advocate the overthrow of the government by force and violence. This trial was a sequel to the 1949 New York trial of 11 top-ranking party officials, whose conviction on similar charges was upheld by the United States supreme court. In the prevailing atmosphere of the "cold war" and of aroused vigilance, communism suffered a setback in the United States in 1952. The same was the case in western Europe. In all the elections held there, the number of Communist voters declined.

The picture in Latin America and in some Asiatic countries was different. Communism there entered into an alliance with

"IS CATCHING COMRADE BUM DRUNK and disorderly because of Capitalist propaganda . . . is claiming he is engaged in pursuit of happiness . . ." a 1952 cartoon by Lichty which appeared in the *Chicago Sun-Times*

extreme nationalism. That was especially true in Latin America, where both movements regarded "Yankee imperialism" as their chief target. In Central America, Guatemala was recognized as the strongest Communist beachhead in the western hemisphere, situated on the strategic flanks of the United States and its South American neighbours. Even in friendly Mexico, the breakdown in the negotiations for a military aid agreement between the United States and Mexico was hailed by the Communists as "one of the most serious defeats inflicted on the oppressive war diplomacy of the United States in Mexico and Latin America." In Brazil, whose Communist leader Luiz Carlos Prestes, perhaps the ranking Communist of South America, was a former professional army officer, the new minister of war, Gen. Ciro Cardoso, warned on April 30 that communism disguised as nationalism had penetrated the army and asked all officers to maintain the most rigorous vigilance so that any surprise action might be avoided. He recalled the abortive Communist revolt of November 1935, which had caused an outlawing of the Communist party in 1937; nevertheless, many Communist dailies and weeklies were published in Brazil, and until General Cardoso's warning, his predecessors as ministers of war had not taken action against Communist influence in the army. Of the free Asiatic nations, India seemed the one in which communism made the greatest progress in 1952, both among certain intellectuals and among the peasants in the southern Indian states of Travancore-Cochin, Madras and Hyderabad.

Community Chest. The community chest is the name given to a local federation made up of health, welfare and recreation agencies which are supported by voluntary contributions. Its purpose is to raise annually, through a single campaign, funds for the support of its member agencies. Associated with, or a part of the chest in many cities, is the community welfare council, the purpose of which is to promote joint planning for health and welfare in the community, and to co-ordinate the services of its member agencies.

The national association of local chests and councils is Community Chests and Councils of America, Inc., which was established in 1918.

Of the 2,050 community chests and welfare councils in operation in July 1952 (1,595 chests and 455 councils), 1,528 chests and 424 councils were in the continental U.S.; 5 chests and 3 councils in Hawaii; 54 chests and 25 councils in Canada; 1 chest in South Africa; 1 chest in the Virgin Islands; 1 chest in Cuba; 1 chest in Australia; 1 council in Greece; 1 council in the British West Indies; 1 chest and 1 council in Japan; 1 chest in the Philippines; 1 chest in Alaska; and 1 chest in the Canal Zone. Almost every city in the U.S. (except New York city, which has a limited joint-financing organization and a welfare council) in 1952 had a community chest or similar plan of federated financing for its voluntary social services. In 1,500 cities in 1951, more than 20,000,000 contributions totalling \$240,920,220 were given to community chests to be used during 1952 for voluntary health and welfare services in their communities.

In 1951 more than 50 chest cities moved toward a broader type of federated fund raising by organizing united campaigns, sometimes under chest auspices, sometimes under a new organization of which the chest was a part. Such campaigns included funds both for local agencies and for certain national health appeals which wished to be included. This trend was credited to the demand by contributors, notably corporations and employee groups, for fewer separate campaigns during the year.

National promotion of chest campaigns is carried on under the name "United Red Feather Campaigns of America," using the national symbol of the red feather.

Officers of Community Chests and Councils of America, Inc., for 1952 included: honorary president, Gerard Swope, New York city; president, H. J. Heinz II, Pittsburgh, Pa.; treasurer, H. L. R. Emmet, Erie, Pa.; secretary, Walter G. Davis, Portland, Me. Ralph H. Blanchard was executive director. Headquarters are at 155 E. 44 St., New York city. (B. A.)

Community Trusts. An aggregate of \$110,091,128 was reported as the assets of community trusts and foundations in the United States, Canada and Hawaii at Jan. 1, 1952. During 1951 these composite charitable foundations appropriated \$5,003,811 and received new resources totalling \$8,151,630.

The largest of these foundations was the New York Community trust whose 102 funds were valued at \$19,178,448. The Cleveland foundation reported \$17,112,607; Chicago Community trust, \$11,549,948; Permanent Charity fund, Boston, Mass., \$10,166,417; and California Community foundation, Los Angeles, \$7,593,687.

Of the disbursements made in 1951, the New York Community trust paid out \$1,164,912; Chicago Community trust, \$517,942; Cleveland foundation, \$484,918; Winston-Salem foundation, \$479,063; and Permanent Charity fund, Boston, \$475,320.

Funds newly created in that year included \$4,173,183 accruing to the Cleveland foundation, \$589,539 reaching the New York Community trust, and \$425,924 added to the Winston-Salem foundation.

Of 71 community trusts surveyed in 1952, 62 were administering principal resources and 56 were making current distributions out of 972 funds on hand. Their cumulative disbursements from 1931 through 1951 stood at \$43,694,357.

A community trust consists, usually, of a series of trust funds of varied sizes, held by a number of corporate trustees and applied for diverse charitable uses under the central supervision of a joint distributing committee. The trustee of a given fund is ordinarily chosen by its founder. The distributing committee, when authorizing disbursements by the trustee, customarily undertakes to give expression to the specific charitable desires of a founder—stated either when the trust is created or perhaps (in cases of living trusts) subsequently—but is likewise empowered to take appropriate remedial action if previously expressed preferences later become impossible or impractical of execution. (R. Hs.)

Congo, Belgian: see BELGIAN COLONIAL EMPIRE.

Congregational Christian Churches. The Congregational Christian Churches are a Christian communion the first of whose members came to the United States in the "Mayflower" in 1620 and in the general immigration to Massachusetts Bay beginning in 1629.

As of Jan. 1, 1952, the total number of Congregational Christian churches in the United States was 5,620, with a combined membership of 1,241,477. These figures indicate a decrease in the number of churches during the year and an increase (13,950) in the number of communicants.

At the beginning of the year there were 5,789 ministers of whom 3,280 were pastors of churches. Those who were not pastors were for the most part engaged in Christian service in schools, colleges, the missionary field abroad, the military chaplaincy and organizations such as the Y.M.C.A. In 1951, 130 candidates were ordained, the largest number to enter into the Congregational Christian ministry since the year 1903.

At the beginning of 1952 there were 646,086 children in the church schools of the communion, reporting a gain of 26,407 during the year preceding.

At the biennial meeting of the general council, held in Claremont, Calif., in June 1952, three actions of unusual importance were discussed and determined:

1. The proposed union of the Evangelical and Reformed Church with the Congregational Christian Churches received new impetus. The appellate division of the supreme court of the state of New York had, in the spring, reversed the judgment of a lower court which had enjoined further procedure in the direction of union. This reversal had freed the denomination to resume negotiations with the Evangelical and Reformed Church. The general council declared its willingness to enter into joint meetings with the appropriate body of the other denomination as soon as the case was completely out of court (one further appeal being possible) and expressed the hope that a constitution for the proposed national body (the General Synod of the United Church of Christ) should be prepared before the union was effected.

2. The Council for Social Action, an organization devoted to the Christianizing of social relations, having been under attack by certain politically conservative groups within the denomination, the general council approved the appointment of a board of review of nine members to inquire into the history and prospects of the Council for Social Action and, if the board felt necessary, to suggest changes in its structure and methods.

3. In view of the vast population shifts in the United States

and in order to take a fair share of responsibility for planting new Protestant churches in the rapidly developing new communities of the country, the general council voted unanimously to attempt to raise a fund of \$4,500,000 for loans on a revolving basis to congregations in need of new buildings. This fund was to be administered by the Board of Home Missions of the Congregational Christian Churches. (See also CHURCH MEMBERSHIP.)

(D. Ht.)

Congress, United States. The results of the Nov. 1952 election, as of Nov. 17, 1952, indicated that the following members would comprise the 83rd U.S. congress.

United States Senate: Democrats, 47; Republicans, 48; Independent, 1.

Congress of Industrial Organizations: see LABOUR UNIONS.

Connecticut. This southwesternmost of the New England states, known also as the "Nutmeg state," the "Land of Steady Habits," the "Constitution state" and one of the 13 original states, has an area of 5,009 sq.mi., including 110 sq.mi. (approximately) of water. According to the official census report of 1950, the population was 2,007,280, or a gain of 17.4% over 1940; 77.6% urban, 19.2% rural nonfarm and 3.1% rural farm. Nonwhite inhabitants numbered 54,951, including 53,472 Negroes and 333 Indians. Foreign-born inhabitants numbered 297,859. Population figures for the principal cities were: Hartford, the capital, 177,397; New Haven, 164,443; Bridgeport, 158,709; Waterbury, 104,477; Stamford, 74,293; and New Britain, 73,726.

History.—Since the general assembly meets biennially in the odd-numbered years, there was no regular session in 1952, nor did the governor call a special session, although considerable pressure was exerted to have him call one after the report on the reclassification of state employees was made public. This study had been authorized by the 1951 legislature. The completed report, while it corrected some inequities and recommended some salary increases, did not meet the expectations of the majority of state employees who wanted a general increase.

The Public Utilities commission granted franchises to two natural gas suppliers, and the transmission lines were almost completed. Consumers were to be provided with natural gas before the end of the year at an expected reduction in bills of 8% to 10%. The state's new motor vehicle responsibility law went into effect July 1.

On Sept. 15 Gov. John Lodge dedicated the state's new \$2,000,000 terminal building at Bradley field in Windsor Locks, located about 14 mi. from both Hartford and Springfield, Mass. He officially proclaimed the new building "Murphy terminal" in honour of Francis S. Murphy, chairman of the Aeronautics commission.

On July 28 Brien McMahon, Connecticut's senior U.S. senator (Dem.) and chairman of the U.S. Atomic Energy commission, died. A month later the governor named William A. Purtell of West Hartford to the interim term expiring Jan. 3, 1953.

In state politics the chief interest was in the election of two senators, no state officials coming up for election until 1954. The Republican party nominated William A. Purtell to complete until 1957 the unexpired term of Brien McMahon, and Prescott S. Bush to run against William Benton. The Democrats nominated A. A. Ribicoff to fill the McMahon vacancy and

William Benton to succeed himself. The Republican candidates were elected.

The principal state officers in 1952, all Republicans, were governor, John Lodge; lieutenant governor, Edward N. Allen; secretary of state, Mrs. Alice K. Leopold; treasurer, Joseph A. Adorno; comptroller, Fred R. Zeller; and attorney general George C. Conway.

Education.—The following statistics are for the school year 1951-52. There were at that time 22 colleges and professional schools with 24,798 students; 4 teachers' colleges with 4,615 students; 6 junior colleges with 5,370 students; 12 state vocational-technical schools with 350 teachers and 14,918 students; 8 state-aided schools with 104 teachers and 1,100 students. In public education there were 90 high schools with 2,600 teachers and 62,204 pupils; 35 junior high schools with 928 teachers and 16,461 pupils; 693 public elementary schools with 7,417 teachers and 217,059 pupils. In addition there were 118 parochial schools with 1,200 teachers and 49,563 pupils. The state expended \$12,800,000 for public schools, and the total amount of public expenses for public schools was \$60,200,000. Finis E. Engleman was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—The state public welfare department reported that in Dec. 1951 there were more than 65,000 persons receiving public assistance, a reduction of 5.7% from 1950. The cost was \$4,029,382, or 1.6% more than in 1950. The various types of relief were as follows: general local relief to 11,793 persons cost \$526,549; old-age assistance was given to 19,024 at a cost of \$1,305,046; 17,155 dependent children received \$614,239; 364 blind received \$26,011; 12,177 in mental, feeble-minded and tubercular state institutions received \$1,370,360; 3,265 county wards cost \$144,296; and state wards, 2,095 in number, received \$42,251.

Communications.—As of July 1, 1952, there were 838,451 motor vehicles registered in the state and 944,714 drivers licensed. For the state fiscal year ending June 30, 1952, the gasoline tax receipts and the motor vehicle fees were \$33,523,937. The railroad mileage remained stationary at 830.57 mi. The mileage in the state highway system was 2,988, of which 145 was four-way divided lane. There were 26 standard broadcasting stations, 9 frequency modulation stations and 1 television station. There were 41 airports (13 commercial) and 15 seaplane bases (10 commercial).

Banking and Finance.—The state treasurer reported the financial condition of the state as of June 30, 1952, as follows: cash balance, June 30, 1951, \$26,631,087.30; receipts, \$673,168,194.92; making a total of \$699,799,282.22. Disbursements were \$672,751,736.01, leaving a balance of \$27,047,546.21 as of June 30, 1952. The total bonded indebtedness of the state was \$237,725,000, made up of long-term bonds in the amount of \$82,459,000, tax anticipation notes of \$14,750,000 and bond anticipation notes of \$140,516,000.

The bank commissioner reported that as of June 30, 1952, 72 mutual savings banks had assets of \$1,627,748,996; 55 state banks and trust companies had assets of \$1,032,565,751; 48 national banks had assets of \$999,703,000; 7 industrial banks had assets of \$7,623,192; 2 private banks, \$1,922,723; and 31 building or savings and loan associations \$84,027,850.

Agriculture.—The department of farms and markets reported that cash farm income for 1951 was \$171,184,000, compared with \$147,386,000 in 1950.

Table I.—Principal Crops of Connecticut

	Indicated 1952	1951	Average 1941-50
Corn, bu.	1,824,000	1,710,000	1,993,000
Oats, bu.	160,000	124,000	160,000
Hay, tons	438,000	449,000	442,000
Tobacco, lb.	24,138,000	22,353,000	24,416,000
Apples, bu.	1,201,000	1,656,000	1,231,000
Peaches, bu.	152,000	148,000	127,000

Potatoes, bu.	2,275,000	2,252,000	3,207,000

Source: U.S. Department of Agriculture.

Manufacturing.—Figures released by the state labour department revealed that total nonagricultural employment in July 1952 was 833,040, which was 12,000 more than in July 1951. Persons engaged in manufacturing were more than 1,000 fewer than in the previous year. Labour disputes were the cause of most of the loss, although vacations and shortages of steel caused some temporary layoffs. In nonmanufacturing industries employment rose more than 13,000 over 1951. Unemployment claims in July reflected unsettled conditions and numbered 36,199, about the same as in July 1951 but more than twice the figures of June 1952. The average weekly wage in manufacturing industries was \$68.11 and in nonmetallic manufacturing, \$62.26. (J. Br.)

Table II.—Mineral Production of Connecticut

Mineral	(In short tons)		1949	
	Quantity	Value	Quantity	Value
Clays	292,000	\$ 236,000	289,000	\$ 217,000
Feldspar	15,000	102,000	14,000	95,000
Quartz	28,000	167,000	16,000	97,000
Sand and gravel	2,998,000	1,862,000	2,648,000	1,587,000
Stone	1,861,000	2,789,000	1,696,000	2,461,000
Other minerals	519,000	...	430,000
Total		\$5,675,000		\$4,887,000

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Connecticut in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available.

Consumer Credit. During the year 1952 the use of credit by consumers continued to occupy a

normal place in the United States economy; regulation of consumer credit by the federal government came again to an end, and the study of this type of credit gained increasing attention.

During the year, credit sales to household consumers amounted to approximately 34% of the total volume of business done in retail stores. About two-thirds of such credit sales were made on open charge accounts, the remainder on instalment contracts. Consumers resorted to a somewhat greater extent than usual to making cash loans during 1952.

The increased volume of credit sales, resulting from the expansion of the general economy and from the greater use made of credit by consumers in 1952, produced outstanding debts amounting to about \$21,500,000,000. This represented an increase of 11% over the debt outstanding during the previous year. The debt continued, nevertheless, to bear about the same relation to the disposable personal income of consumers, about 9%, that it had over a long period of so-called normal nonwar years.

Whereas during 1951 approximately 67% of outstanding consumer debt was of an instalment character, during 1952 that type of debt amounted to 70% of the total. During the latter year instalment debt increased 15% while total noninstalment debt increased by only 4.5%.

The bulk of the increase in instalment debt appeared to result not from any great increase in the purchase of durable goods but rather from an appreciable increase in the amount of instalment cash loans made to consumers. Debt incurred in the financing of automobiles and other durable goods increased only 12%, in contrast with a 17% increase in instalment loan debt. The explanation of this appears to be that during the year a large number of consumers undertook to get "caught up" with their normal everyday bills by consolidating them and paying them off with money borrowed from cash-lending institutions. There also seemed to be an appreciable amount of refinancing of existing automobile debt to make monthly payments less burdensome.

The relatively small (4.5%) increase in noninstalment debt, consisting largely of charge account debt, reflected the general expansion of the economy during 1952. In that year, disposable personal income increased about 4% and personal consumption expenditures about 5%. The greater percentage increase in instalment debt during the year (12%) reflected in turn the greater variability of that form of credit, attesting the fact that during periods of prosperity people spend a proportionately greater amount on durable goods.

On May 7, 1952, regulation W expired. By congressional authority the federal reserve board had through this regulation prescribed minimum down payments and maximum payment periods for instalment sales and loans. Originated as a wartime measure allegedly for curbing inflation and curtailing the civilian use of critical materials, this regulation had been prolonged after the war as a tool of economic control.

As a result of the critical interest in consumer credit which had arisen in connection with arguments for and against its regulation, much thought was given to clarifying concepts of this type of credit. From one viewpoint, it had been widely and loosely regarded as so many dollars of debt which, by virtue of its magnitude, was presumed to be "safe" or "dangerous," as the case may be, in the economy. On the other hand, it had been conceived not as an isolated debt factor but as an integral part of the dynamic economy. So viewed, consumer debt was related to such other factors as income, prices, population, savings, standard of living and the like, and was shown to bear a normal relation to the whole. In still another way it had been regarded as an effect of general economic conditions rather than a cause. During 1952 another concept of consumer debt as "dynamic thrift" was advanced.

By this concept it was recognized that consumer debt, particularly instalment debt, represents the acquisition by consumers of the many and varied products of industry. Consumer debt represents the exchange of individual earnings for desired commodities, most of which accumulate as personal property in individual estates and thus comprise an increase of individual as well as of social wealth. The term "saving" had commonly been applied only to the retention of balances earned and in excess of expenditures and to the increase of cash deposits and other highly liquid forms of investment. This new concept of credit held expenditures (usually made on credit) for durable personal assets to be not "spending" in the sense of dissipation of wealth, assets and equity, but rather the accumulation of goods, the enjoyment of which is one of the final ends of the economic process. Consumer credit was regarded as a laudable means to this end and one of the business tools by which the people of the United States had created a standard of living exceeding that of all other nations. (See also FEDERAL RESERVE SYSTEM.)

(R. BA.)

Canada.—In Jan. 1952 a government order relaxed restrictions on credit buying by extending the time limit from 12 to 18 months, but the 50% down payment on cars and the 33% down payment on electrical durables were maintained. In May, however, with a drop in the cost-of-living index, the government removed all consumer credit restrictions. By July the Canadian bureau of statistics was reporting, for its sixth successive week, sharp increases in business. On the national average, sales were up 17.1% over 1951; in the eastern part of the country business was up 32.1%; in British Columbia, 25%. Electric stoves, refrigerators and similar instalment-plan durable household goods were the clear leaders in sales.

During the second quarter of 1952, cash sales of automobiles dropped 5.5%, but instalment sales jumped 82.3%; the total amount was \$209,300,000, compared with \$114,800,000 for the second quarter of 1951. On July 1, 1952, Canadians owed \$534,000,000 to retail stores on instalment buying, which was up \$56,100,000 from July 1, 1951, and up \$85,400,000 from the total owed on April 1, 1952.

(C. CY.)

Great Britain.—In contrast with the position in the United States and Canada, restrictive controls in the United Kingdom upon consumer credit before 1952 had either been operated indirectly by control of advances through the joint-stock banks, or had been imposed only upon price-controlled articles to prevent overcharging on such goods. The year 1952 however saw, for the first time in Great Britain, the imposition of direct controls designed to restrict the flow of consumer credit. A series of statutory instruments were issued during the year, prescribing minimum down payments and maximum periods of repayment in credit transactions over a wide range of articles, which had previously been outside the scope of the original credit control orders. For nearly all goods, except bicycles, the

terms imposed were one-third deposit and 18 months' maximum credit. For bicycles the requirements were one-fourth deposit and 12 months' maximum credit. The goods affected by these new controls included among other things radio and television equipment (including radio-phonographs), motor vehicles, cycles, office furniture and equipment, together with a considerable proportion of household appliances, such as washing machines, refrigerators, mixers and similar articles.

At the same time these regulations were introduced, the government also considerably increased its pressure on banks to restrict monies made available for consumer credit purposes. In previous years the restriction had meant that, in general, advances should not exceed a predetermined level (usually the amount outstanding in early 1947); now, however, an actual reduction in balances was to be imposed. This control was in the nature of advice to the banks and, as in previous years, there was no legal directive that compelled bankers to comply. In the event, however, most of the various bankers' customers in this field were requested to reduce their outstanding balances by at least 10% by Sept. 1.

The partial "buyers' strike" apparent throughout the period made it difficult to assess the full effect of the new controls on consumer-credit transactions. Certainly turnover fell abruptly, especially in the radio industry. That this was not however entirely caused by the restrictions was shown by the fact that even in goods unaffected by the control, a considerable decline in consumer credit was generally reported.

Certain minor alterations were also made in the "price control" type of consumer-credit restrictions. These were made necessary since further removal of price controls had reduced the list of goods still affected to utility furniture, office furniture and linoleum.

A limited range of goods (principally in textiles and nonutility furniture) thus came outside the scope of any credit control, for the first time since it was imposed during World War II. (C. McN. G.)

Contract Bridge. A survey published in 1952, taken by the Association of American Playing Card Manufacturers, showed canasta and not contract bridge to be favoured by most U.S. card players, with contract bridge second. The information gathered for this survey was taken late in 1951, however, and by the summer of 1952 there was every indication that contract bridge had not only regained first place but was enjoying a greater popularity than in any year since 1935.

Part of the reason was general acceptance of "point-count" valuation of the hand, instead of honour-tricks. Charles Goren, one of the principal authorities, had espoused this in the autumn of 1949. Ely Culbertson, the other principal authority, turned to it in 1952, publishing a new point-count method differing somewhat from Goren's.

In bridge tournaments, attendance increased as it had regularly for 12 consecutive years. The American Contract Bridge league ended the year with more than 43,000 members, all expert tournament players. The principal U.S. tournaments were played in New York city in February, in Cincinnati, O., in August and in Miami, Fla., in December.

United States team champions for the third consecutive year were Howard Schenken, George Rapee, Samuel M. Stayman and B. Jay Becker of New York city, and John R. Crawford of Philadelphia, Pa. In 1950 and 1951 they had also won the world championship by defeating the champions of the European Bridge league, Great Britain in 1950 and Italy in 1951.

No match was played in 1952, since the Swedish team, 1952 European champions, could not make the trip to the U.S. for

the scheduled date in November, and determination of the 1952 world champions was deferred to a match scheduled to be played in New York city in Jan. 1953.

The principal U.S. tournament champions in 1952 were:

Life masters' individual: Harry J. Fishbein, New York city.

Senior masters' individual: Harry Cohen, Brooklyn, N.Y.

Life and senior masters' pairs: Edgar Kaplan and Ralph Hirschberg, New York city.

Masters' teams: Schenken, Rapee, Stayman, Crawford, Becker.

Open teams, cumulative scoring (Vanderbilt cup): Milton Moss, Jesse Sloan, Ned Drucker, Irving Kass, Sidney Mandell, New York city.

Masters' pairs: Williams E. Joseph, Paterson, N.J., and William W. Jackson, Rochester, N.Y.

Men's pairs: William Rosen, Chicago, Ill., and Arthur Grau, Dayton Beach, Fla.

Women's pairs: Mrs. Shirley Fairchild and Mrs. Sidney Lee, Dallas, Tex. (A. H. Mr.)

Great Britain and Europe.—The 1952 European championship was played at Dún Laoghaire, Dublin county, and was won by Sweden. For the first time the competing teams were divided into two sections. Sweden and Italy qualified from section A, Austria and Great Britain from section B. In the semifinal round Italy beat Great Britain by 13 match points and Sweden beat Austria by 29. Sweden beat Italy in the final by the extraordinarily narrow margin of 2 match points. In the play-off for third place Austria beat Great Britain by 5 points. The British team was: J. T. Reese and B. Schapiro, K. W. Konstam and L. W. Dodds, L. Tarlo and H. Franklin, Maj. G. Fell (non-playing captain). The ladies' championship was won for the third year running by Great Britain, whose team won every match. Norway was second. The British team was: Lady Rhodes and Mrs. R. Markus, Mrs. P. Williams and Mrs. H. R. Evans, Mrs. F. Gordon and Mrs. A. L. Fleming, Capt. E. Kemson (nonplaying captain).

In Great Britain the winners of the principal competition were: Waddington cup for masters' pairs, L. Tarlo and H. Franklin; Gold cup, J. T. Reese (captain), B. Schapiro, A. Meredith, H. Leist, S. Booker and S. Lee; Crockford's cup, L. Ellis (captain), J. Whitby, R. Sharples and J. Sharples.

The Camrose trophy was again won by England, who drew with Northern Ireland and won the remaining matches.

Co-operatives. In Nov. 1952 the executive director of the Cooperative League of the U.S.A. reported that 19 of the largest regional co-operatives, serving both farm and city consumers, had distributed \$805,000,000 worth of goods during the year, and reported savings on their purchases of \$47,000,000, averaging 5.8%. These savings were passed on to individual members of local co-operatives associated with those regional organizations.

The same 19 regional, or area-wide, co-operatives had distributed only \$183,000,000 worth of goods to their members 10 years before. The 10-year increase was 440%. This fourfold increase was in part the result of an increase in prices of the commodities handled. The growth, however, was still impressive.

Production enterprises owned by consumer and purchasing co-operatives had an even more spectacular growth. In 1936 only 7 of the 19 regional co-operatives manufactured any of their own goods. These produced about \$1,000,000 worth in their own factories. By 1952 the regional co-operatives owned more than 200 factories, refineries and other production enterprises which produced \$275,000,000 worth of goods for distribution through co-operatives. The production of farm supplies was the largest item. The 20 co-operative oil refineries, however, were responsible for a very substantial part of the volume. The biggest new project of the co-operatives was a \$16,000,000 nitrogens plant which was to be built in Lawrence, Kan., by the Consumers Cooperative association.

MEMBERSHIP in U.S. co-operatives, 1952 (Source: The Cooperative League of the USA)

In the consumer goods field a number of new co-operative supermarkets were opened during the course of the year. The business volume of the 1,000 co-operative food stores was estimated at a little more than \$100,000,000 per year at the close of 1952. The biggest new unit of the year was a \$1,000,000 co-operative shopping centre built in Akron, O., with sponsorship of the rubber workers and other organized trade union members. Business was already moving forward at a rate of \$3,000,000 a year.

The International Cooperative Petroleum association, which included 23 central co-operative organizations in 13 countries, had its largest membership in the U.S. where the co-operatives owned 1,600 oil wells producing nearly 150,000 bbl. of refined products a day.

During 1952 co-operative housing made the greatest gains in its history. The co-operative section of the Federal Housing Administration reported that 89 projects had been insured for a total of \$152,000,000 worth of mortgage insurance. These projects would house 16,000 families on completion. The projects ranged from individual homes in small towns and cities in Oklahoma to teacher-owned apartments in Omaha, Neb., and large multifamily projects in New York, N.Y., and other metropolitan areas.

Twelve additional co-operative projects to be built at a cost of \$14,000,000 had commitments for insurance. Total applications for mortgage insurance on new housing projects taken since the creation of the co-operative section of FHA in 1950 amounted to \$334,000,000.

The Insurance Conference of the Cooperative League, made up of 14 insurance companies in the fields of automobile, fire and life insurance, reported 4,500,000 policyholders and more than \$1,000,000,000 of life insurance in force. Premium income of \$90,000,000 a year made these companies a growing factor in the insurance industry.

The group of Farm Bureau Insurance companies, with head-

quarters in Columbus, O., reported that its automobile company had become the second largest mutual casualty company in the country. Growth was so rapid that the Farm Bureau companies started a decentralization program, and by the end of 1952 had opened new, self-contained regional headquarters in New Haven, Conn.; Annapolis, Md.; and Harrisburg, Pa.

This insurance group organized the People's Development company to undertake housing projects, People's Mortgage company to help provide mortgages for co-operative housing projects, a new finance company to finance automobiles and other purchases, and a garage company to cut the costs of accident repair work. The People's Broadcasting company, also owned by the Farm Bureau Insurance group, operated stations in Worthington, O., and Washington, D.C., with plans to expand the radio coverage within the next year.

The co-operative credit unions, in a new campaign of organization, added nearly 1,000,000 new members in the U.S. and Canada during the year. There were 16,000 credit unions serving more than 7,000,000 consumers. Small savings to their members had made possible an accumulation of assets of nearly \$1,000,000,000.

The Cooperative Health Federation of America, with members in the U.S. and Canada, reported a membership of 750,000 persons who were securing medical and hospital care through co-operative associations. Trade union-owned and other semico-operative health services, supported partly by members and partly by health and welfare funds to which employers contributed, were serving another 5,000,000 members.

Rural electric co-operatives continued to add new miles of line and new membership. About 200,000 more farmers became members of electric co-operatives during the year, boosting the total to more than 3,500,000 members. About 55,000 mi. of lines were energized, bringing co-operative ownership of power lines to 1,126,000 mi.

Several new co-operative telephone companies were organized during the year.

Marketing co-operatives with nearly 4,000,000 farmer-owners were responsible for helping their members market \$8,000,000,000 worth of commodities during the year. This business was handled through 7,000 local associations in such fields as grain, dairy products, cotton, fruits and vegetables, livestock, poultry, tobacco and other commodities.

The newest co-operative added to the extensive pattern of co-operative ownership was the American Travel association, organized early in 1952 by eight national organizations including the National Education association, Cooperative League of the U.S.A., Congress of Industrial Organizations, Americans for Democratic Action, National Farmers union, Farm Bureau Insurance companies, General Conference of Seventh Day Adventists and the University of Indiana. The American Travel association was to be devoted to stimulation of low-cost purposeful travel. (See also FARM CREDIT ADMINISTRATION.)

(W. J. CL.)

International.—In general the co-operative movement throughout the world showed many signs of progress in 1952. The well-established European co-operative movements all had to contend with the effects of the general rise in prices, even though the rise was here and there retarded or checked. Business turnovers rose, but expenses increased more than in proportion, financial liquidity became more difficult to maintain and dividends on purchases tended to be small. Outside Europe the greatest interest continued to be manifested by governments as well as by intergovernmental agencies in the development of all kinds of co-operative enterprise as a means of encouraging and accelerating progress in economically and socially backward territories.

The International Co-operative alliance removed its secretariat to a new headquarters in London in Sept. 1952. Throughout the year the meetings of its committees were marked by a less acrimonious tone in the exchanges between representatives from the U.S.S.R. and eastern European countries and those of western co-operative movements. The policy of rejecting applications for membership of the I.C.A. from organizations under rigid state or party control was firmly maintained. The co-operative unions of Byelorussia and the Ukraine, already indirectly affiliated through their membership of the Centrosoyus (Russian Co-operative society) of the U.S.S.R., were refused direct membership in their own right. Rumanian and Bulgarian organizations were not permitted to change their status from that of "individual" to "collective" members which would have increased their representation and voting power.

On the other hand, the Japanese Agricultural and Consumers' Co-operative unions, re-established after World War II, were admitted, as was also the National Centre of Co-operative Studies of Brazil. The I.C.A. now had affiliated bodies in 33 countries. The central committee of the alliance held its annual meeting at Reykjavik where the Icelandic Co-operative union was celebrating its 50th anniversary. The alliance was represented by its director at the first congress of the Indian Co-operative union which met at Bombay in February. A special auxiliary committee on co-operative housing was set up and confederations of co-operative housing societies in Germany and France were affiliated to the I.C.A.

The annual statistical returns based on 1950 showed an increase of 8,000,000 in the aggregate membership of the I.C.A.'s affiliated bodies, which now amounted to 106,000,000, covering 370,443 individual societies. The movement's trading sector had a turnover of £3,735,000,000 and the value of its own production was £942,500,000. Co-operative banks and central unions carried out transactions involving £10,283,000,000 and loans advanced by them and credit societies amounted to £780,000,000. The number of insurance policies running with co-operative insurance societies was 38,000,000. Excluding the U.S.S.R., more than 1,000,000 were employed in the movement.

Great Britain.—Membership of retail societies increased to 10,929,336 at the end of 1951, a net increase of 237,793 on the 1950 figure. Share capital of societies, standing at £223,410,028, showed a decrease of £8,298,793. This decrease, which affected almost all societies, was a matter of concern to the movement. Loan capital of retail societies totalled £63,884,014, a decrease of £350,540. Reserve and insurance funds at the end of the 1951 trading period were £24,595,325, an increase of £1,048,029. Total retail cash trade was £663,908,339, an increase of £50,143,119. This increase, however, was entirely the result of price increases and inflation. The English Co-operative Wholesale society's trade rose from £321,500,000 to slightly more than £359,000,000 and that of the Scottish C.W.S. from £68,000,000 to £75,000,000. An important decision taken by the co-operative congress in June 1952 was to abolish the central board of the co-operative union. This step made the central executive the governing body of the movement between congresses.

(W. P. Ws.)

Copper. World production of copper increased 5% in 1951, bringing the level up to within 6% of the war peak of 3,075,000 tons in 1942.

For comparison with the mine output figures shown in Table I, a corresponding table of smelter output will be found in the article MINERAL AND METAL PRODUCTION AND PRICES.

United States.—The salient statistics of the copper industry of the United States, as reported by the U.S. bureau of mines, are shown in Tables II and III.

Mine, smelter and refinery outputs were at about the same

Total	608.7	847.6	834.8	752.8	909.3	928.3

level in 1951 as in 1950, the first two showing a slight increase and the last a small decrease because of a drop in imports of crude copper. There was also a decrease in refined imports that was only partly offset by a decrease in refined exports, leaving a decrease of 4% in the supply available for use.

In 1952 the production rates were slightly lower than in 1951, the following being the totals for the first eight months of the year: mine output 614,671 tons; smelter output 679,370 tons (63,106 tons from foreign ores); refinery output 772,273 tons (158,581 tons from foreign crudes); refined imports, 184,327 tons; refined exports 112,903 tons; consumption 918,268 tons, an increase of 2% over the corresponding period of 1951.

Canada.—Primary copper output was 130,611 tons in the first half of 1952, down from 137,664 tons in the first half of 1951.

(G. A. Ro.)

Corn. Corn (maize) in the U.S. gave an abundant 1952 crop of 3,256,550,000 bu., the second largest on record (3,605,000,000 bu. in 1948) and of excellent quality. The 83,369,000 ac. planted were only 94% of the 89,000,000-ac. officially recommended goal. In spite of drought damage in the south, average yields were the second highest on record.

In Iowa both yield per acre (63 bu.) and production were new high records. Iowa corn production was valued at fully \$1,000,000,000, the first crop in any state to reach that amount.

Table I.—U.S. Corn Crops

	1952*	1951	Average, 1941–50
Total production (thousands of bu.)	3,256,550	2,941,423	3,011,651

Brazil	—	230,000	228,000	215,153			
Argentina	—	78,500	105,000	301,986			
Mexico	148,000	135,000	98,420	67,523			
Italy	97,000	118,000	98,000	113,000			
China	—	—	—	262,000			
India	—	79,500	68,000	67,240			

Prices to farmers, reflected of course in the major market, Chicago, continued during part of the year at a level slightly higher than in 1951, advancing from an average of \$1.62 per bushel in Nov. 1951 to \$1.73 in the summer of 1952, above the government support level of \$1.57 per bushel. However, the price declined below the new support level of \$1.60 as the 1952 crop began to move to market. It seemed likely that government loans or purchase agreements would eventually be taken out on much more than the 26,300,000 bu. of the 1951 crop so covered. Carry-over on Oct. 1, 1952, was reduced to about 500,000,000 bu., compared with 739,000,000 bu. a year earlier. Holdings of the Commodity Credit corporation on Oct. 1 were approximately 300,000,000 bu., compared with 487,400,000 bu. in 1951. Total supplies thus were 3,758,000,000 bu., compared with 3,681,000,000 bu. in the previous year. Exports of as much as 100,000,000 bu. were anticipated against only 75,000,000 bu. in 1951-52.

In spite of a partial failure of the corn crop in Yugoslavia, it appeared that the 1952-53 world crop was about 5,600,000,000 bu., 6% larger than the previous year, 18% more than prewar and the second largest on record. Mexico attained an all-time record production. Argentinian exports of corn were 501,563 long tons (about 24,000,000 bu.) in 1951-52, compared with only 155,303 tons in the previous year—however, that level was only about one-tenth of prewar. Early conditions for the 1952-53 crop were the most favourable for several years and planted acreage presumably was stimulated by the announcement of the new basic price to growers equivalent to \$2.24 per bushel in U.S. currency, compared with \$2.04 previously. The South African corn crop harvested in early 1952 was reduced by drought to an estimated 62,000,000 bu., compared with 101,000,000 bu. a year earlier. The domestic price was equivalent to \$1.18 per bushel. (See also LIVESTOCK; VEGETABLES.)

Corporation Income Tax: see TAXATION.

Cortisone, Hydrocortisone and Corticotropin.

Cortisone, a crystalline steroid hormone, was isolated from extracts of the adrenal cortex, along with several other steroids, in 1935 by E. C. Kendall and co-workers and independently by S. Reichstein. In 1946 L. H. Sarett synthesized the substance from a bile acid (desoxycholic acid) which allowed it to be produced in quantities sufficient for clinical evaluation. In 1948 J. S. Hench and colleagues demonstrated that the manifestations

PACKAGING CORTISONE at the Danville, Pa., plant of Merck & Co., Inc., where the antibiotic went into mass production in 1952. Vials are shown being filled with cortisone in sterile suspension

of rheumatoid arthritis and other related nonhormonal conditions were suppressed strikingly by its administration. After 1949 cortisone was found to alter beneficially the course of many apparently disparate pathologic conditions. It then became evident that the adrenal cortex exerted a wide influence on bodily mechanisms, that it was involved in the basic reactions of tissues and that hormones derived from it could be therapeutically applied more broadly than initially anticipated.

Hydrocortisone, designated at first as Kendall's Compound F, was also isolated from extracts of the adrenal cortex in 1935. It is closely related chemically to cortisone, differing in only one structural detail—a hydroxyl radical instead of a ketone group is present at the 11th carbon position in the steroid nucleus. Until 1951 supplies of the hormone were too small to permit trials in patients, but limited laboratory studies were conducted. These demonstrated that hydrocortisone possessed physiologic properties similar to cortisone and that, milligram for milligram, it was distinctly more potent. Laboratory data also suggested that hydrocortisone was the principal adrenal cortical steroid and participated, more than cortisone, in physiologic reactions, at least under conditions of stress.

Methods for producing hydrocortisone in larger quantities were developed in 1951. At first the hormone was made by two very complicated processes of biosynthesis, and later by chemical synthesis. Two forms of hydrocortisone were studied clinically: the pure hormone, hydrocortisone (free alcohol); and an ester, hydrocortisone acetate. Hydrocortisone (free alcohol) was found to be much more soluble than the acetate in various media and almost twice as effective when administered by mouth. The acetate ester, however, proved highly efficient when used locally; *i.e.*, applied to the eyes or injected directly into joints. Tests made with hydrocortisone (free alcohol) in rheumatoid arthritis and in asthma indicated that it was at least 50% more potent than cortisone. Smaller oral doses were needed to control the diseases, and treatment was attended by fewer hormonal complications, suggesting that hydrocortisone (free alcohol) may be superior to cortisone as a therapeutic agent.

Corticotropin (ACTH, adrenocorticotrophic hormone), a complex protein derivative of the anterior pituitary gland, was extracted as an impure compound by J. B. Collip and co-workers

in 1933 and was isolated in pure form in 1943 by G. Sayers and collaborators and by C. H. Li and colleagues. The hormone regulates the function of the adrenal cortices and stimulates them to secrete a number of steroid hormones, principally hydrocortisone and corticosterone (Kendall's Compound B). Its physiologic effects, except for minor variations, are similar to those of hydrocortisone and cortisone. Because its action is mediated through the adrenal cortices, corticotropin is effective only if these glands are functionally responsive. Being a protein substance, it is destroyed when taken orally and must be administered by injection.

The mechanism by which the pituitary-adrenal system functions under physiological conditions was, by 1952, only vaguely understood. Presumably the output of steroid hormones from the adrenal cortices is regulated by the amount of corticotropin secreted by the anterior pituitary gland. A state of reciprocal control was thought to exist whereby a fall in the level of steroid hormones in the blood stream acts as a stimulus for the production of greater amounts of corticotropin. The latter hormone is supplied continuously through the circulation, its concentration ever fluctuating to cope with environmental changes. Under stress corticotropin is discharged in greater amounts, and the adrenal cortices are stimulated to yield more steroid hormones. These, in turn, incite the metabolic changes needed for adequate physiologic adjustment.

How hydrocortisone and cortisone (whether administered directly or produced indirectly by corticotropin) exert their beneficial influence on disease processes was not understood, but authorities agreed on certain general points: (1) The hormones do not destroy pathologic organisms and do not act directly against toxins or allergens. (2) They suppress, in some mysterious way, the reactions of tissues to injuries of various types. (3) Their effects are temporary and last only as long as they are taken—sustained improvement in chronic diseases depends on their continued administration, but in some acute self-limited diseases they may inhibit the process while the disease runs its natural course. (4) Large and apparently supernormal amounts must be given in order to reverse inflammatory or allergic reactions—doses which, when excessive, may produce unwanted hormonal complications.

Cortisone, hydrocortisone and corticotropin stimulate a variety of physiologic functions and metabolic and clinical signs of adrenal cortical hyperfunction may attend their use. Undesirable effects such as the following may appear: (1) retention of salt and fluid (oedema); (2) abnormal fat metabolism manifested by rounding of facial contour, deposits of fat in the neck, and gain in weight; (3) increased androgenic (masculinizing) activity as evidenced by increased hair growth, acne and decreased menstrual function; (4) impaired carbohydrate tolerance; (5) nervous system effects such as euphoria, nervousness, insomnia and alterations in mood or psyche. Hormonal complications, however, are usually mild and are fully reversible, disappearing with reduction of dosage or cessation of administration. Their incidence and severity vary directly with the daily amount of hormone used and most may be controlled or prevented by judiciously employing doses of reasonable size, or by prescribing simple adjunctive measures, or by using both of these procedures. The hormones are contraindicated in the presence of some conditions, including active tuberculosis, severe diabetes mellitus, psychotic tendencies and active peptic ulcer.

Rheumatoid Arthritis.—Cortisone had been used extensively as a treatment for rheumatoid arthritis. Its administration rapidly improves those reversible manifestations resulting from active inflammation (joint pain, stiffness, tenderness, swelling, etc.), and suppression of the disease may be maintained for long periods with continued therapy. Irreversible changes resulting

from joint destruction (fixed deformities, ankylosis, etc.) are not benefited. Cures are not promoted, the basic pattern of the disease is not altered, and symptoms return, usually promptly, when the hormone is withdrawn.

Various dosage plans for cortisone were employed but most rheumatologists preferred continuous treatment with relatively small maintenance doses. Amounts of about 100 mg. a day (given by mouth in four divided doses) are prescribed at first to bring the disease under control. Dosage is then gradually reduced to the smallest daily amount which will uphold adequate improvement. This amount is then continued, the dosage being adjusted from time to time to counteract fluctuations of symptoms. Attempts are made to provide reasonable degrees of relief; complete suppression of the disease is not sought unless this can be accomplished with small and presumably safe doses.

With this scheme satisfactory results had been maintained in approximately two-thirds of the patients. The size of the daily dose required varied in general with the severity of the rheumatoid arthritis. Results were poorest in severe cases with very active disease as they usually required large maintenance amounts of cortisone—amounts which frequently provoked adverse hormonal complications and could not be tolerated. All potential risks from indefinitely continued therapy had not been determined, and many authorities advised, for safety's sake, periodic rest intervals from treatment. While cortisone had been highly successful in the management of many patients with rheumatoid arthritis, most rheumatologists did not consider it as treatment of choice for most cases and recommended that conservative measures be tried first.

Hydrocortisone acetate in small doses injected directly into an affected joint was found to produce marked alleviation of pain, stiffness and swelling. The relief is usually quite temporary, however, and repeated injections at frequent intervals are needed to maintain improvement; sometimes a small series of injections promotes more prolonged relief. As the benefits are entirely local, the procedure is of limited value. It may be used successfully when the arthritis is confined to one or two accessible joints and as an adjunctive measure to suppress, during the course of otherwise satisfactory systemic therapy, flare-ups of the disease in one or two joints.

Rheumatic Fever.—Used in adequate doses, cortisone and corticotropin rapidly suppress the acute manifestations of rheumatic fever (fever, tachycardia, polyarthritis, elevated sedimentation rate, electrocardiographic abnormalities, etc.). With continuation of therapy, the inflammatory changes may be inhibited while the disease runs its natural course; but premature discontinuance of therapy encourages relapse. The drugs were most effective when employed early during an initial acute attack. Investigators hoped that routine treatment with the hormones would prevent or minimize residual heart damage, but follow-up studies for several years would be needed to establish how fully this hope might be justified. Reports were conflicting, and some, based on controlled investigations, indicated that the course of acute rheumatic fever is not influenced more favourably by the hormones than by conventional salicylate therapy, and that their use does not lessen the incidence of valvular heart disease.

Other Collagen Diseases.—Diffuse collagen diseases such as periarteritis nodosa, disseminated lupus erythematosus and dermatomyositis may be temporarily benefited by cortisone or corticotropin administration. The dosages required are usually large and adverse effects are often marked. Use of the hormones during acute phases had prolonged life, but frequently the diseases became unresponsive later, terminating fatally despite treatment.

Osteoarthritis.—Cortisone and corticotropin administered

systemically had not proved worthwhile in the treatment of osteoarthritis. The meagre benefits derived usually did not warrant the risks involved. Hydrocortisone acetate injected locally into an osteoarthritic joint, however, frequently gave temporary relief and the procedure was used to good advantage in suppressing exacerbations of symptoms in large weight-bearing joints.

Asthma and Allergies.—Cortisone and corticotropin proved valuable in the treatment of asthma. For very acute or intractable cases (*status asthmaticus*) some authorities preferred corticotropin administered intravenously. Less severe cases may be controlled readily by cortisone given orally. Short-term therapy is usually sufficient for seasonal asthma, but prolonged administration may be needed for chronic cases. As for rheumatoid arthritis, the smallest maintenance dose possible was employed and some asthmatic patients were maintained satisfactorily on cortisone given continuously for more than two years. A small number of patients eventually became resistant to the drug, but responsiveness returned following rest periods from treatment. Excellent results were reported in sensitivity reactions to various drugs (penicillin, tetanus antitoxin, gold salts, sulfonamides, etc.), in contact dermatitis resulting from poison ivy, and in serum sickness.

Addison's Disease and Other Endocrine Disorders.—Cortisone therapy served as a great advance in the management of adrenal and pituitary insufficiencies. Small doses of the hormone (10 mg. to 25 mg. a day), along with auxiliary measures (dehydrocorticosterone and increased salt intake), allowed patients with Addison's disease to live indefinitely as relatively healthy individuals. In acute adrenal insufficiency resulting from extensive burns, shock from various causes, or following partial or complete removal of the adrenal glands, cortisone often was a life-saving measure. It was highly effective also in the preoperative and postoperative management of patients undergoing surgery of the pituitary gland.

Eye Diseases.—By their favourable action in controlling inflammation and exudation, cortisone and corticotropin earned an important place in the treatment of many eye conditions. They were of special value in suppressing ocular inflammation resulting from acute toxic or physical trauma, and allergic reactions of the external eye and uveal tract (iritis). In inflammations resulting from infection, specific antibiotic or chemotherapeutic agents employed in conjunction with cortisone yielded best results. Diseases of the external eye may be treated successfully by topical application of cortisone, either as an ointment or drops, but when internal structures are involved, both local and systemic administration are recommended.

Blood Disorders.—Cortisone and corticotropin proved disappointing in most haematologic disorders. Some investigators claimed that 40% of their patients with idiopathic thrombocytopenic purpura experienced long remissions following a course of either hormone, but others noted less favourable results and did not consider the drugs as major adjuncts in therapy. A number of reports indicated that about 50% of children with acute leukemia improved dramatically for temporary periods with cortisone therapy; recurrences, however, often failed to respond and lasting remissions were rarely provoked. Cortisone and corticotropin were said to be less effective than other measures in the treatment of chronic leukemia. Some cases of Hodgkin's disease showed dramatic and prompt, but temporary, remission of the disease. Cosmic Rays: see PHYSICS.

Costa Rica. A Central American republic, Costa Rica is located between Nicaragua and Panamá. Area: 19,238 sq.mi.; pop. (1950 census of the Americas). 801,000, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian; (1951 est.) 825,000. The capital is San José (1949 pop., 79,694); other principal cities are Alajuela (11,187), Cartago (11,624), Guadalupe (15,966), Heredia (10,730), Liberia (3,061), Limón (12,666), Puntarenas (12,329), Tibás (5,227) and Turrialba (5,316). Language: Spanish; religion: predominantly Roman Catholic. President in 1952: Otilio Ulate Blanco.

History.—On the political front, 1952 was an essentially uneventful year for Costa Ricans. President Ulate continued the task of reconstruction following the chaotic civil war of 1948, and the reputation of his government as one of the more democratic in the Caribbean area was strengthened. Col. José Figueres, who had led the pro-Ulate forces in the civil war, and was himself acting president for a time thereafter, drifted into political opposition against the government. On March 9, Figueres announced that he would be a presidential candidate in the election scheduled for 1953. (G. I. B.)

Education.—In 1951 there were 1,139 public and private primary schools with 4,821 teachers and 116,157 pupils. In 1950 there were 8 public secondary schools, 16 private schools and 7 technical schools. University education was available at the University of Costa Rica. About 16% of the 1952 budget was allocated to education. There were 92 motion-picture theatres in 1951 with seating capacity of 43,000.

Finance.—The monetary unit is the colón, valued at 17.64 cents U.S. currency, controlled rate, and 15.04 cents, uncontrolled rate, on Sept. 30, 1952. The national budget for 1952 provided for expenditure of 149,388,795 colones and revenue of 149,612,220 colones. Revenue in 1951 was 160,067,000 colones; expenditure, 140,890,000 colones. The public debt on Dec. 31, 1951, was 367,007,979 colones, of which 164,534,396 colones represented the external debt. Currency in circulation on Aug. 31, 1952, was 110,100,000 colones; commercial deposits 141,600,000 colones; gold reserves \$2,060,000. The cost of living index (San José) stood at 124 in Sept. 1952 (1948=100).

Trade.—Exports in 1951 amounted to \$39,287,464; imports, \$55,740,518. Chief exports were coffee (56%), bananas (27%), abacá (6%) and cacao (5%). Leading customers were the U.S. (75%), Canada (7%), Italy (3%), the Netherlands (2%), and Belgium (2%); leading suppliers, the U.S. (66%), Germany (7%), the United Kingdom (6%), Canada (4%) and the Netherlands Antilles (2%). Important imports included textiles, machinery and vehicles, wheat flour and petroleum products.

Communications.—Railroad trackage included 410 mi. of public railway and 250 mi. of private railway. On Dec. 31, 1948, there were 1,015 mi. of highway, of which 926 mi. were all-weather roads. Registered motor vehicles on Jan. 1, 1951, included 4,645 automobiles, 2,308 trucks and 810 buses. In 1950 domestic air line flights carried 124,000 passengers and 14,700,000 lb. of cargo; international flights, 42,000 passengers and 1,600,000 lb. of cargo.

Agriculture.—Coffee production in the 1951-52 season was 351,049 bags of 132 lb. each (1950-51: 386,449 bags). In 1951, 228,488 bags were exported to the U.S. Costa Rica continued in 1951 to be the world's largest exporter of bananas, exporting 15,254,000 count bunches (50 lb. each), of which 11,712,000 bunches went to the U.S. In 1951-52, 2,000 metric tons of abacá were produced and, in 1950-51, 5,000 tons of cacao. The 1950 livestock census (preliminary figures) showed 592,402 cattle, 112,156 pigs and 77,335 horses. (J. W. Mw.)

Cost of Living: see BUSINESS REVIEW; PRICES.

Cotton. **Cotton Manufacture.**—A year of "recession" in U.S. cotton spinning activities appeared to have ended in the early summer of 1952. Early in the year production of cotton textiles was about 15% below 1951. Prices were still being cut on some items for March and April delivery. New England had about one-tenth of its textile workers unemployed. In April the industry operated at only 114.5% of capacity on a two-shift, 80-hour basis. By September the industry was operating at 135.1% of capacity on a two-shift, 80-hour basis, compared with 128.1% in August and 127.8% in September 1951. Producers were completely booked on fourth quarter denim goods and there were delivery problems regarding sheets and pillow cases. Price ceilings on most textiles had been suspended in May. Fall prices were firm, some strong; some yarns

LANCASHIRE COTTON MILL which operated only three days per week in 1952 during an acute slump in the British cotton industry brought on by a gradual loss of foreign and Commonwealth markets

were three to five cents per pound above spring levels. The New England group continued to press for equalization of the minimum wage level with southern mills.

Exports of cotton piece goods were forecast within the wide range of 600,000,000 to 777,000,000 sq.yd. for 1952, compared with more than 800,000,000 sq.yd., valued at \$468,000,000, in 1951.

British textile exports ceased to fall in July 1952 for the first time in a year, but cotton goods exports for the first seven months of the year were £96,991,000 compared with £120,567,000 in the same months of 1951. In April British cot-

Table I.—Exports of Cotton Piece Goods

(In millions of square yards)

*Estimated. †Projection of rate for first six months.

ton spinners for the first time in ten years were allowed limited freedom to buy raw cotton direct rather than through the raw cotton commission.

The meeting of the leaders of the world's cotton textile trade at the International Cotton conference, held at Buxton, Eng., in September, apparently solved few or none of the problems confronting the industry. The information in Table I on exports, actual and anticipated, was released. That some of the expectations for 1953 were far above 1952 rates is clear, but pre-World War II rates averaged about 7,000,000,000 yd. in world trade.

United States Production.—The estimated U.S. 1952 cotton

Table II.—U.S. Cotton Production by States

(In thousands of 500-lb. bales)

State	Indicated 1952	1951	Average 1941-50
Texas	3,660	4,074	3,020
California	1,900	1,765	627
Mississippi	1,800	1,608	1,652
Arkansas	1,250	1,249	1,373
Arizona	1,050	803	250

Florida	27	32	13
Virginia	15	14	21
Other states	11	8	14

crop of 14,905,000 bales was a short-fall of the official goal of 16,000,000 bales and the 1951 crop of 15,144,000 bales, but exceeded the 1941-50 average of 11,775,000 bales. Acreage in cultivation on July 1 was indicated at 26,051,000 ac., about 7% less than July 1951 and much below the 28,000,000 ac. official goal. This was interpreted unofficially as indicating a crop of about 14,500,000 bales. The official indication as of Aug. 1 was 14,735,000 bales, but widespread drought and high temperatures after mid-June retarded growth and caused extensive shedding. The estimate as of Sept. 1 was reduced to 13,889,000 bales, after which there was some recovery and excellent harvest weather. The October estimate was 4% above that of September. Acreage for harvest was estimated at 24,639,000 ac., and the lint yield per harvested acre at 289.7 lb., compared with 271.9 lb. in 1951 and an average for 1941-50 of 267.6 lb.

Long staple American Egyptian cotton produced in Arizona, Texas and New Mexico was estimated at 80,800 bales, compared with 47,200 in 1951 and an average for 1941-50 of 28,400 bales. Yields of 280.2 lb. per acre were favourable but not much above 1951 or average.

All in all it appeared that the crop, though smaller than requested, would, with the carryover on Aug. 1 of about 2,500,000 bales, fully provide for estimated 1952-53 domestic consumption of 9,200,000 bales and for exports, probably in the range of 4,500,000 to 5,000,000 bales, rather than about 5,800,000 bales as in 1951-52. Thus it seemed that the carryover might be increased moderately on Aug. 1, 1953.

Prices fluctuated rather sharply with changing crop and demand prospects during the year, but neither reached the ceiling nor dropped to government support levels. The ceiling price of 45.39 cents per pound was suspended in May, with notice, however, that it would be reimposed if cotton should again rise to a point within 2 cents of the ceiling. The average price support rate for 1952-crop middling $\frac{7}{8}$ -inch upland cotton was set at 30.91 cents per pound, compared with 30.46 cents for the 1951 crop. Purchase agreements were made available to cotton producers for the first time as well as loans already used. The price declined somewhat after the more favourable crop report in October, and producers were advised officially to re-

COTTON CROP in the United States. The figure for 1952 is the department of agriculture's estimate

strict their marketings until prices firmed. In October it was announced that there would be no restricting acreage allotments or marketing quotas on the 1953 cotton crop, whether of upland or extra long staple type.

World Cotton Production.—World cotton production for 1952-53 was estimated tentatively at 34,200,000 bales, compared with 35,300,000 bales in the previous year and 31,689,000 bales average pre-World War II. However, the world supply was tentatively forecast at 48,700,000 bales, 1,900,000 bales higher than a year earlier, because of an increased carryover on Aug. 1, 1952, of 3,000,000 bales, thus more than offsetting the 1,100,000 bale crop decline.

World cotton consumption in 1951-52 was approximately 32,200,000 bales, compared with 33,000,000 bales during the preceding year.

World trade in raw cotton amounted to about 12,000,000 bales in 1951-52, only 100,000 bales more than in the previous year when supplies were much scarcer. In general, 1952 was a year in which foreign cottons lost much of their previously high premiums over U.S. cotton. The decline, though orderly for the most part, amounted in some cases to 10 to 15 cents per pound in a month's time. In Japan cotton prices declined to a level only one-third as high as the peaks reached after the Korean outbreak. Brazil was reported as offering to buy the entire crop at a minimum price to producers, equivalent to 14 cents per pound for cotton in the boll, and then to sell on the world market. The U.S.S.R., meanwhile, was reported as attempting to expand its production by one-fourth. Pakistan, however, cut the export duty from 300 rupees per bale in 1951 to 180 rupees; then in September reduced it to 90 rupees on long staple cotton in order to clear stocks and earn foreign exchange. India also cut duties by 50% in March, from 400 rupees (\$8.40) to 200 rupees per bale.

Cottonseed.—The U.S. cottonseed crop of 1952 was indicated as probably not more than 6,057,000 tons, compared with 6,325,000 tons in 1951. Cottonseed meal was at its ceiling price during 1952, prior to ginning of the new crop. The oil, however, tended lower. The world cottonseed crop was estimated at 16,170,000 short tons, about 4% less than in 1951-52, but 6% more than pre-World War II. (See also LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY; WOOL.)

Cricket. Ever since the victorious tour of the West Indians in England in 1950 the prospect of their visit to Australia had aroused the keenest anticipation. In the event, the test matches played between the two teams in the winter of 1951-52 proved disappointing. At no time did the cricket of either side recapture the brilliance that had been seen when the Australian and West Indian teams had last visited England. In the highly charged atmosphere of the test matches the crises, when they came, seemed to reveal something lacking in the leadership and temperament of the West Indians, while the Australian batting still appeared to be missing the lead given to it by Sir Donald Bradman. Australia won by four matches to one. The great match in the series was the fourth when the West Indians came within an ace of making the tally two all.

In the summer of 1952 the fifth Indian touring team to visit England found that, in spite of fine weather, their lack of experience was a fatal handicap. In the first match at Leeds, V. S. Hazare, 89, and V. L. Manjrekar, 133, redeemed a sorry start, only to see the last 7 wickets fall for 29 more runs. The start of the second Indian innings was sensational, 4 wickets falling before a run had been scored. In the second match at Lord's, India was reinforced by V. Mankad. Going in first, he at once played attacking strokes, but only his captain could give him real support to produce a modest total of 235. He then entered upon an astonishing bowling marathon which brought him in 72 overs 5 wickets for 196 runs. The opening English batsmen were tightly pegged down and though L. Hutton accelerated in the later stages of his 150, it was left to T. W. Graveney and T. G. Evans to bring real life into the game, Evans only just failing to reach his 100 within the two hours before lunch on the third day; England's total was 535. Mankad then immediately returned to the field to play another magnificent innings of 184. With Hazare again giving him valiant support the score at one time read 270 for 2 wickets and the English attack seemed verging on the innocuous, but once again the later batting broke down.

In the county championship Surrey won "by the length of a street," with a total of 256 points. Yorkshire and Lancashire were runners-up.

The Gentlemen v. Players game produced a splendid finish, the Players winning by 2 runs in the last over of the day. In the University match, against Cambridge's four test match players, D. S. Shepard, P. B. H. May, J. J. Warr and the South African C. N. McCarthy, with R. G. Marlar, the best amateur spin bowler, to support them, Oxford could field only one player of approximately equal class in M. C. Cowdrey. Fighting dourly, their batsmen achieved a first innings of 272, Marlar taking 7 wickets. But Cambridge was able to declare before lunch on the last day at 408 for 8. With Oxford losing 6 wickets for 94 all seemed over, but A. L. Dowding (52) played admirably and A. Coxon challenged fate with rare courage: a catch or two was missed and the clock won. Harrow beat Eton by 7 wickets, their first victory in the two-day match since 1938. (H. S. A.)

Crime. **United States.**—The nation-wide crime reports compiled by the Federal Bureau of Investigation showed that there was an increase in nearly all crimes during the first half of 1952 to a general level that was 6.4% higher than that recorded in 1950. Thus for the fourth successive year the nation's general crime trend continued upward. These general patterns affected both cities and rural areas in 1952. The largest semiannual increase was in robbery, which jumped 13.8%. Other notable rises were in burglaries, 8.7%, auto thefts, 8.8%, and assaults with a lethal weapon, 9.3%.

As in prior years the east south central states had the highest homicide rates, with the New England states showing rates

only 8% as high. Property crimes—robberies, burglaries and thefts—recorded highest rates on the Pacific coast.

Completed data for 1951 showed that 58% of all robberies were committed on the highway, with 31% directed against commercial establishments. Prominent in the latter category were gasoline stations, chain stores and banks.

Commercial premises also were the favoured objects of attack in burglaries, 90% of which occurred during the nighttime.

Of stolen property, three-fourths of the cases involved losses of less than \$50 in value. As usual, more than 90% of all stolen cars were recovered, but only one auto theft in four was followed by an arrest. Of these, 64.1% were found guilty. These figures have a special bearing because auto thefts represented 60.2% of the dollar loss from crime during the first half of 1952.

Recoveries of other types of property were effected at much lower rates, as follows: jewellery 18.2%, clothing 16.6%, currency 12.9%, furs 3.7% and miscellaneous property 26.0%.

For the limited list of offenses for which national tabulations are made, more than 1,000,000 were committed in the first six months of 1952. Since the FBI recorded more than 423,000 arrested persons whose fingerprints had been taken during the same period, it was believed that the annual total of all major offenses must be close to 5,000,000. This figure would not include minor offenses for which state laws do not permit the police to fingerprint. Participation of youthful offenders in criminal acts is also hard to gauge because of the widespread policy to treat them as juvenile delinquents. But even with most offenders under age 16 removed beyond all possibility of counting, 15% of all persons arrested and fingerprinted during the first half of 1952 were under 21 years of age. An additional 14.3% were between 21 and 24 years of age. The largest number of fingerprinted arrests were recorded for age 18, with ages 23, 21, 22 and 24 following so closely as to place them all in a single outstanding category.

Of the 423,000 persons arrested and fingerprinted during the first half of 1952, three-fifths already were represented in the files of the FBI identification division.

As noted in previous years, the rural crime rates for the first half of 1952 showed crimes against the person to be generally comparable with those recorded in cities. Crimes against property, however, are generally at a lower rate in rural areas, in part because of the difficulties experienced in disposing of stolen property, and in part because the ready availability of costly objects is less in rural areas than in urban. An added factor is the less satisfactory level of crime reporting by rural sheriffs and constables, which is particularly notable with respect to crimes against property.

Sixty-four police officers were killed in line of duty during 1951, showing a heavy increase (78%) over 1950.

The size of police forces in U.S. cities continued to increase more rapidly than the population. As of April 30, 1952, the number of police per 1,000 of urban population had risen another 5 points over 1951, for a national ratio of 1.75. Larger cities showed much higher levels. The Middle Atlantic states had the highest ratio, in part because of the heavy concentration of large cities in that region. (See also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LAW; SECRET SERVICE, U.S.)

BIBLIOGRAPHY.—Federal Bureau of Investigation, *Uniform Crime Reports for the United States and Its Possessions* (semiannual bulletins for 1951 and for the first half of 1952); International City Managers Association, *Municipal Year Book, 1952*, vol. 19 (1952). (Br. S.)

Great Britain.—In 1951 the number of persons in England and Wales found guilty of offenses of all kinds was 723,320 (compared with 688,650 in 1950), of whom 132,817 had committed indictable offenses, 584,454 nonindictable offenses and

WILLIE ("THE ACTOR") SUTTON, notorious bank robber and escaped convict, being photographed at a police station in Brooklyn, N.Y., in Feb. 1952 (note the handcuffs dangling from his wrists). The informant responsible for Sutton's arrest was shot and killed on March 8

6,049 offenses against defense regulations, an increase of 16,796 and 19,610 and a decrease of 1,736, respectively, compared with the figures for 1950. Of those found guilty of indictable offenses 117,004 were males (compared with 100,948) and 15,813 females (compared with 15,073), which showed that male offenders had been responsible for nearly the whole of the increase. Among the indictable offenses that contributed to the increase were larceny (increased 19%), breaking and entering (+5%), receiving (+22%) and sexual offenses (+13%), whereas cases of robbery decreased by 23%.

The number of murderers of 116 persons aged one year or over was 104; in 5 other cases the murderers remained undetected. Sixty-three persons were arrested in murder cases involving 65 victims. Nineteen of them were found unfit to plead, 9 found guilty but insane, and 7 acquitted (1 still awaiting trial). Of the 27 who were sentenced to death, 18 were executed, 5 reprieved, 2 certified insane after sentence and removed to Broadmoor institution, 1 conviction was quashed on appeal and 1 case was still awaiting final disposal. The percentage of executions of those sentenced to death rose, therefore, from 48% in 1950 to 66% in 1951. Thirty-nine murderers or suspects committed suicide before arrest. Suicides declined from 4,324 to 4,282 (2,675 males and 1,607 females), attempted suicides from 4,676 to 4,524 (2,255 males and 2,269 females).

The number of persons found guilty of traffic offenses, accounting for 51.7% of all nonindictable offenses, increased from 357,932 to 370,912; the number of those found guilty of drunkenness from 45,533 to 51,239, i.e., by 13%; and prostitution offenses from 6,843 to 7,872, i.e., by 15%. Persons found guilty of cruelty to, or neglect of, children numbered 30 on

indictment (+20%) and 1,046 dealt with summarily (+10%).

The total increase in indictable offenses was from 461,435 to 524,506, mainly accounted for by an increase in simple and minor larcenies and larcenies from unattended vehicles. Robberies went down from 1,021 to 800 cases. The percentage of indictable offenses cleared up by the police remained at 47.

In the metropolitan police district the number of indictable offenses known to the police rose from 100,304 in 1950 to 111,091, *i.e.*, from 11.9 to 13.3 per 1,000 inhabitants, and the number of arrests from 26,862 to 30,068. Robbery was one of the few categories of offenses to show a decline (from 256 to 214 cases, the lowest figure since 1942). Pocket-picking and hand-bag-snatching also declined (from 1,087 to 950) in spite of 98 cases occurring at the Battersea pleasure park gardens and fun fair during the Festival of Britain. The percentage of crimes cleared up declined from 32.4 to 31.5.

In Scotland, the number of persons against whom a crime or an offense was proved was 99,950 in 1951 compared with 96,271 in 1950, an increase of 3.8%. The percentage of male offenders was 91.8, compared with 91.7% in 1950. The number of crimes and offenses known to the police was 184,756, an increase of 6.4% over 1950; 58% of them were committed in the four counties of cities where the number of crimes was 24.8 per 1,000 of the population, compared with 19.2 in the ten large burghs with separate police forces (13.0 in 1950) and 9.4 in the 19 counties or joint police areas. Only 9 cases of murder became known to the police compared with 21 in 1950; of the 7 persons proceeded against, 1 was convicted of murder and executed.

Germany.—For the first time since the end of World War II criminal statistics for the Federal Republic of Germany began to appear. Information was published for the first six months of 1950 for adult offenders and for the whole of 1950 for juvenile delinquents. The number of adults found guilty of offenses against the criminal code was 69,128 in the first quarter and 63,453 in the second quarter of 1950, of whom 40 and 35 respectively were found guilty of murder. The total for juveniles, *i.e.*, persons between 14 and 18, found guilty of offenses against the criminal code was 20,650.

Crude Oil: see PETROLEUM.

Cuba. The republic of Cuba occupies the entire island lying between 20° and 25° N. lat. and 74° and 85° W. long. The main island and numerous small islands under Cuban sovereignty have an aggregate area of 44,217 sq.mi. The pop. (est.) approximated, in June 1952, 5,523,000; Havana, and nearest large suburban cities, had an aggregate population (est.) of nearly 1,000,000. Two other cities were believed to have populations of 100,000 or more—Santiago, with (est.) 170,000, and Camagüey, 100,000.

Presidents: until March 10, 1952, Carlos Prío Socarrás; after March 10, provisionally, Fulgencio Batista.

History.—The 1952 sugar crop, greatest in Cuba's history, exceeded 7,000,000 tons. The U.S. congress extended the Sugar act of 1948 to Dec. 31, 1956, so that the amount of sugar purchased by the U.S. government as a reserve could be increased. Cuba pressed for international consideration of the working draft intended to be substituted for the Sugar agreement of 1937. A meeting of delegates from countries participating in the 1937 conference took place at London Sept. 30–Oct. 1, 1952, with observers from other countries. It was agreed to request all governments represented in the United Nations to aid in bringing about a new negotiating conference in the spring of 1953, to pass on the working draft and policies involved.

On March 10, 1952, a military rising led to the resignation and exile of Pres. Prío Socarrás. Former President Batista assumed power, his provisional regime being recognized promptly by most foreign powers. An election was announced for a late date in 1953. An extensive investigation of public accounts led

GEN. FULGENCIO BATISTA addressing his troops after seizing power in Cuba, March 10, 1952

to a report from the finance ministry (June 6, 1952) involving both previous administrations (Ramón Grau San Martín and Pío Socarrás) in the malversation of public funds in excess of \$96,000,000, largely in the manipulation of retirement "reserves." Unrest in labour circles, particularly in Havana, continued to stimulate efforts to deal with housing problems and mounting price levels. The rapid concentration of population in the metropolitan area of the capital aggravated the strain on transportation facilities. Nationalizing the Havana United railways was delayed, at least, by the change of government.

Diversification of industry and agriculture alike was a particular concern of the Batista administration. A livestock census was decreed, to be taken in 1952, with a view to increasing the production of meat in the republic. Surveys of new mineral and manufacturing possibilities were undertaken. A maritime commission was established with instructions to devise a plan for building a fleet of small-tonnage ships for trade and passenger service. The perennial problem of high transit costs into and out of Havana was tackled. The government approved the outlay of \$2,000,000 on ferry boats to carry tourists from Florida, with their automobiles, from Key West to Havana. The Cuban sugar interests followed with particular concern research undertaken in 1951-52 with a view to developing paper for newsprint and other uses out of sugar cane waste (bagasse). The industrial alcohol and other by-product markets were likewise given more alert attention than heretofore, in consequence of the great surplus of sugar on hand. (C. E. Mc.)

Education.—In the school year 1944-45 there were 498,286 children in attendance at public schools and 72,000 at private schools. There were 21 institutes for advanced education and a normal school and a commercial school in each province. University education was available at the University of Havana, the Oriente university (Santiago de Cuba) and the Catholic University of Villanova (Havana).

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The budget for the fiscal year 1952-53, as decreed on June 28, 1952, was balanced at \$234,069,756. On Dec. 31, 1951, the funded national debt amounted to \$217,700,000; estimates of the floating debt ranged as high as \$180,000,000. Currency in circulation (Dec. 31, 1951) totalled \$918,000,000, of which \$569,000,000 was in U.S. dollars; demand deposits \$512,000,000; gold reserves (June 30, 1952) \$318,000,000. The national income in 1951 was estimated at \$1,860,000,000. The retail food price index (Havana) stood at 96 in May 1952 (1948=100).

Trade and Communications.—Exports in 1951 totalled \$766,000,000; imports were \$640,000,000. The International Monetary fund estimated that exports of sugar and fresh fruits were undervalued by \$20,000,000. The chief exports were sugar (82%), molasses (5%) and tobacco and products (5%). Leading customers were the U.S. (54%), the United Kingdom (14%), Japan (5%), the Netherlands (4%) and Germany (3%). Leading suppliers were the U.S. (77%), the United Kingdom (3%) and Germany (2%).

Railways (1949) included 3,017 mi. of main line, 660 mi. of sidings and yards and 7,870 mi. of industrial trackage. Roads (1949) included 1,720 mi. of paved highways and 600 mi. of improved highways. As of Jan. 1, 1952, there were 86,464 passenger cars, 37,215 trucks and 4,930 buses. The merchant marine had 34 steamers and motor ships (100 tons and over) aggregating 36,135 gross tons on June 30, 1949. At the beginning of 1952 two television stations were in operation, both in the Havana area.

Agriculture.—Sugar cane continued to be by far the most important crop. Production of sugar in the 1951-52 season reached the record figure of 7,963,689 short tons (1950-51: 6,348,660 tons) and that of molasses 397,900,000 gal. Production of other crops in 1951-52 included rice (milled) 166,000,000 lb.; corn 398,000,000 lb.; henequen fibre 18,000 short tons; tobacco 39,000 tons; beans 46,000,000 lb.; coffee (1950-51) 547,000 bags of 132 lb. each. In 1950-51 there were an estimated 4,116,000 cattle, 154,000 sheep and (July 1947) 1,700,000 pigs.

Manufactures.—There were in 1952 more than 160 sugar mills scattered throughout the island. Production estimates for 1951 included cement 422,000 short tons; cotton piece goods 36,295,484 sq.yd.; cigarettes 8,372,000,000 units; rayon staple 7,647,054 lb.; tires 110,213 units; inner tubes 51,309 units; and leather footwear 6,300,000 pairs.

Mineral Production.—Production estimates in 1951 (ores, in long tons) included metallurgical manganese 143,039; chemical manganese 8,618; copper concentrate 59,218 (metal content 32%); refractory chromite 77,816; and nickel 14,406 (metal content 1.35%). (J. W. Mw.)

Curaçao: see NETHERLANDS ANTILLES.

Curling. The United States regained honours in the Gordon medal bonspiel, an international competition dating

back to 1884, by defeating Canada March 14-15 at Schenectady, N.Y. The American skips led their men to victory by a score of 287-264 in a meet that found 16 teams representing each country. Another feature of the season was the fifth international gathering at Utica, N.Y., where Canadian rinks won major laurels. The Lachute, Que., rink, with Del McTavish as skip, defeated Kingston, Ont., by 15-14 for the Mitchell medal; Fred Stetson's Peterboro team won the Allen medal, and Fred Rubbra's Caledonia curlers from Montreal took the Country Club cup. A Utica team, led by Bob Davies, captured the Dewar trophy.

The Ardsley, N.Y., No. 2 rink, skipped by A. B. Hastings, won the annual Douglas medal play at Mount Hope, N.Y. Nashua, N.H., skipped by Carl Hines, won both the Gordon Grand National and Emmet medals, and the Mohawk trophy went to Utica in the annual bonspiel at Schenectady.

Winnipeg's Fort Rouge Curling club, represented by Johnny Watson, Andy Williams and Allen Langlois, took the Canadian playdowns with a record of ten victories and no losses and gained the right to represent Manitoba in the Brier Dominion title bonspiel, which it also won. Jimmy Welsh's Deer Lodge club from Winnipeg was the grand aggregate victor in the Manitoba bonspiel.

A squad from the Grand National club and the Midwest Curling association visited Scotland for a series of matches, marking the first time a United States curling team ever had visited Scotland.

Curling made tremendous gains in the United States, especially in the midwest and west. The upswing was noted in the annual bonspiel of the Midwest Curling association as all records were broken when 64 rinks representing 25 affiliated clubs competed on 8 ices at Portage and Madison, Wis. Top honours in the tourney went to the Glen Harris rink of Superior, Wis., which went through six games without a setback. The victors halted Francis Kleffman's Hibbing, Minn., team by 11-2 in the final. The fourth annual bonspiel of the U.S. Women's Curling association at Utica, N.Y., reflected the growing interest among the feminine players, with 30 rinks from the U.S. and Canada competing for honours. The Wauwatosa Granite trophy, major prize at stake, was won by the Toronto team of Mrs. Robt. Amell, Mrs. L. C. Muir, Mrs. D. H. Easton and Mrs. M. A. Moysey. (T. V. H.)

Currency: see COINAGE; EXCHANGE CONTROL AND EXCHANGE RATES. See also under various countries.

Cycling. Steve Hromjak, United States army sergeant from Cleveland, O., pedalled his way to the senior title in the national amateur meet at Highland Park, N.J., Aug. 30-31, 1952. Capturing the one- and two-mile events, Hromjak scored 17 points, 3 more than did Gus Gatto, of San Jose, Calif., the defending champion, whose only first came in the five-mile grind. Dick Stoddard, Denver, Colo., had ten tallies to finish third. Jeanne Robinson, Detroit, Mich., registered victories in two races to gain the women's open title with 19 points as Detroit's Nancy Nieman was runner-up with 14. Gay Juner, Daley City, Calif., placed third. John Chiselko of Somerville, the New Jersey state boys' champion, was victor among the juniors.

Andy Werth, Columbia university student, led the senior men in the eastern states racing at Highland Park, Joe Sloan of Somerville taking the men's junior laurels. Lorraine Engstrom, New Rochelle, N.Y., was queen among the women and Nick Sostilio, New York city, took the juvenile division title. Earlier in the season, Werth triumphed in the eastern states 75-mile title road race. Andy Blackman, New York, won the Long Island Grand Prix handicap of about 63 mi. over highways in September.

ber although John Macheroni, New York city, earned the fast-time trophy, the scratch starter being clocked in 2 hr. 44 min. 34.8 sec. A crowd of more than 18,000 saw Ernie Seubert of Brooklyn, N.Y., lead a field of 79 rivals in the ninth running of the 50-mi. tour of Somerville, N.J. Ronald Rhoads of Oakland, Calif., won the United States board track laurels. (See also OLYMPIC GAMES.) (T. V. H.)

C.Y.O.: see SOCIETIES AND ASSOCIATIONS, U.S.: *Catholic Organizations for Youth.*

Cyprus. An island in the eastern Mediterranean, Cyprus is a British colony. Area: 3,572 sq.mi. Pop.: (1946 census) 450,114; (1951 est.) 492,000. Language: Greek 80.3%, Turkish 17.8%; 10% also speak English. Religion: Greek Orthodox 80.4%, Moslem 17.9%. Chief towns: Nicosia (cap., 36,306); Larnaca (15,364); Limassol (24,462); Famagusta (17,973). Governor in 1952: Sir Andrew Wright.

History.—With increasingly disturbed conditions in the middle east in 1952, the strategic value of Cyprus became much more important than its *enosis* movement for union with Greece. On one occasion *enosis* meetings were prohibited by the governor to prevent disorder. The church continued to lead the agitation but without noticeable success. The people were more interested in taking advantage of the presence on the island of a large garrison and many troops on leave from the middle east, who did much to make up for the falling off in the tourist trade brought about by the same general insecurity. Early in 1952 more than 4,000 Cypriots went as volunteers to work in the canal zone to replace the Egyptian labour force which had deserted, and large quantities of vegetables and other products from the island were sold to the garrison in the zone.

The Dekhelia power station was opened and the new grid system came into operation in September. A large cement factory was in the planning stage, and mineral production showed an increase over the previous year. In September the building was started of a cantonment to house 10,000 servicemen and their families. (K. G. B.)

Education.—Primary schools (1951) 705, attendance 63,000. Other schools: secondary 52, agricultural 2, trade 1, teachers' training colleges 2.

Finance and Trade.—Monetary unit: piastre (180 piales=£1 sterling = \$2.80 U.S.). Budget (1952 est.): revenue £5,855,880; expenditure £5,572,782. Foreign trade (1951): imports £19,250,000; exports £15,000,000. Main products: citrus, seeds, vine products, carob, wool and copper.

Cyrenaica: see LIBYA.

Czechoslovakia. A people's republic of central Europe, Czechoslovakia is bounded west and north-west by Germany, north and northeast by Poland, east by the U.S.S.R., south by Hungary and Austria. Area: 49,330 sq.mi. Pop. (1950 est.): 12,340,000. Language (1948 est.): Czech 77%, Slovak 25%, German 3.5%, Hungarian 3.5%, Polish 1.7%. Religion (1930 census): Roman Catholic 77%, Protestant (all denominations) 7.5%, Czechoslovak Church 5.6%, Greek Catholic 1.6%, Jewish 1.9%, atheist 6%. Chief towns (pop., 1947 census): Prague (cap., 922,284); Brno (273,127); Moravska Ostrava (180,960); Bratislava (172,664); Pilsen (117,814); Olomouc (58,616); Košice (58,089). President of the republic, Klement Gottwald; prime minister in 1952, Antonín Zápotocký.

History.—The main problem in Czechoslovakia during 1952 was labour shortage and resistance by the working class to the general economic policy, designed both to subject the Czechoslovak economy to the soviet economy and to reduce the Czechoslovak standard of living to the soviet level. Official propaganda

unceasingly emphasized the need to work harder and urged the trade unions to remember their duties to the state before all else. Labour shortage was a particularly serious problem. In the first two five-year plan periods in the Soviet Union, at least some of the difficulties were overcome by drafting into industry vast numbers of unskilled labourers from the villages. The surplus of rural labour was to some extent an advantage to the soviet economy at this stage. In Czechoslovakia however there had never been a surplus of rural labour on this scale. The only part of the country where it had existed was the most backward part of Slovakia, whose population was not large. Even in Slovakia the planners had difficulty in 1952. The plan of labour recruitment for heavy industry in Slovakia was achieved in 1951 to the extent of only 66%. In the Czech lands the labour surplus did not exist. The only hope was, therefore, to increase the output per worker for the same wage, that is, to lower his standard of living. Among the forms of resistance which this had encountered was the phenomenon of "flitting," well-known in the Soviet Union during the 1930s. According to the official organ of the trade unions the rate of change of jobs was 1,000,000 workers a year.

The climax of the struggle between government and workers came at the plenary session of the Trade Union Central council of July 17-18. Zápotocký, a trade union veteran himself, told his audience that though the visible enemy, the former bosses, had been crushed, the struggle had by no means been won against the hidden enemy, "the remnants of the capitalist bourgeoisie and their servants, capitalist prejudices and outlived views, which still exist in the ranks of our own working people." Trade unions had neglected socialist competition and other means of extracting higher output from the workers. They had failed to unmask and eliminate malpractices of the managerial staff. The unions ought to maintain closer contact with the ministries, and not let themselves be preoccupied with petty issues. At the same time the premier insisted that the party must not interfere in the management of the unions.

Collectivization of agriculture continued. According to Viliam Siroky, the vice-premier, at the end of August 25% of the arable land in Slovakia was collectivized. In June it was stated that there were 7,669 collective farms in the whole republic, comprising 19% of its arable land. With the land held by state farms, this probably brought the "socialist sector" up to nearly 30%. A government resolution of April 19 provided for stricter discipline on state farms, and stressed the part to be played by the Communist party's political departments attached to the farms. At the beginning of the year there was a serious meat shortage. A government statement of Feb. 19 attributed this partly to insufficient attention to livestock by collective farms and partly to defects in the meat processing industry. In April a trial was held of a group of kulaks, one of whom had been a member of parliament for the Agrarian party before 1938. They were accused of sabotage of government agricultural policy and of conspiring with the International Peasant union in exile.

In August the minister of security, Karel Bacilek, announced the creation of an auxiliary security police force. Its tasks would be to safeguard state property and to unmask saboteurs. Another step was taken toward the Stalinization of justice when Stefan Rais, the minister of justice, announced that a bill would be introduced to remodel the institution of procurator, to make it, as in the Soviet Union, independent of the courts.

On May 30 Jan Sevcik, leader of the rump of the Slovak Rebirth party and a vice-premier in the central government, was purged from government and party, on the ground of "continued violations of the policy of the National front." The same fate overtook the secretary of the same party, Jan Valek.

On Feb. 27 Vaclav Kopecky, minister of information, in a

speech to an ideological conference of scientific workers held in Brno, fiercely attacked the memory of Jan Masaryk and Eduard Beneš. Both men, he declared, had been sworn enemies of the Soviet Union. "Under the spell of the cosmopolitanism of Masaryk and Beneš, the Czechoslovak bourgeoisie had despised its own tradition and culture." However, "the most important sections of the nation had remained loyal to their people's roots, sentiments, manners, national tradition and culture, patriotism and their love for the great fraternal Russian nation, love for the Soviet Union and comrade Stalin." (H. S-W.)

Education.—Schools (1951-52): elementary 12,433, pupils more than 1,000,000; higher grade 2,280, pupils 473,000; secondary 292, pupils 75,000; technical 1,243, pupils 96,000; institutions of higher education 17, students 54,900.

Finance.—Budget (1951 est.) revenue 166,520,000,000 koruny, expenditure 166,100,000,000 koruny; (1952 est.) revenue 324,282,000,000 koruny, expenditure 323,529,000,000 koruny. Monetary unit: koruna, with official exchange rates of 12.50 koruny to the rouble, 140 koruny to the pound and 50 koruny to the U.S. dollar.

Foreign Trade.—(1950): Imports U.S. \$653,000,000, exports U.S. \$800,000,000. Main sources of imports (1950): U.S.S.R. 29.4%; Poland, Rumania, Hungary and Bulgaria 26.0%. Main destinations of exports: U.S.S.R. 28.0%; four other eastern European countries 21.1%.

Transport and Communications.—Roads (1946): 43,969 mi. Licensed motor vehicles (Dec. 1950): cars 165,000; commercial 65,000. Railways (1947): 8,161 mi. Air transport (1949): flights 16,833; miles flown 4,884,000. Telephones (1950): 380,000. Radio receiving set licences (1949): 2,280,000.

Agriculture.—Main crops (metric tons, 1950): wheat 1,540,000; barley 1,062,000; oats 818,000; rye 1,140,000; maize 235,000; potatoes 7,500,000. Sugar, raw value 880,000. Livestock: cattle (1951) 4,100,000; pigs (1951) 3,700,000; sheep (1950) 480,000; horses (1950) 640,000. Food production (metric tons, 1949): milk 2,618,000; butter 30,000; factory cheese 13,900; meat 290,000 of which beef 104,000.

Industry.—Persons employed in manufacturing industries (Nov. 1949): 1,477,700. Fuel and power (1950): coal 18,500,000 metric tons; lignite 27,500,000 metric tons; crude oil 275,000 metric tons; electricity 9,120,000,000 kw.hr. Raw materials (metric tons, 1950): pig iron, 1,800,000; steel ingots and castings 2,900,000. Manufactured goods (metric tons, 1949): cement 1,740,000; sheet glass 135,500; cotton yarn 75,800; wool yarn 35,400; rayon filament yarn 5,500; rayon staple fibre 20,500. Production of motor vehicles (1949): 29,500.

Dairy Industry, Bureau of: see AGRICULTURAL RESEARCH ADMINISTRATION.

Dairy Products. Total U.S. milk production for 1952 was estimated at 114,800,000,000 lb., only 99% as much as in 1951 and even more of a deficit compared with the recommended goal of 120,000,000,000 lb., but nevertheless 108% of pre-World War II production.

Exports of dairy products in 1952 dropped to the lowest level since 1940. Imports were up to the highest level since 1937. Embargo on imports of butter, butter oil and nonfat dry milk was discontinued and import quotas were in effect on American cheese, several foreign cheeses and casein. Curbs on some foreign cheese were eased in September.

Though butterfat was officially supported at 69.2 cents per pound and manufacturing milk at \$3.85 per hundredweight, both higher than in 1951, it did not appear that either would be much used, if at all. Fresh milk used as fluid milk and cream was in demand at higher prices. More than half (51.6%), or 57,064,000,000 lb. of the total production, was so used. This amounted to about 400 lb. per person, against 395 lb. in 1951. Retail fresh milk, delivered, averaged about 24 cents per quart, compared with 23 cents in 1951. Prices were expected to be slightly higher in 1953.

Of the 110,600,000,000 lb. of milk utilized (other than as feed for calves), 27,738,000,000 lb. were utilized for butter, whereas 29,270,000,000 lb. were so utilized in 1951 and 44,930,000,000 lb. as recently as 1940. This gave an estimated 1952 production of 1,380,000,000 lb. of farm and factory butter, 95% as much as in 1951 and 64% of the prewar average. Civilian consumption per capita in the U.S. was estimated at 8.7 lb. (9.6 lb. in 1951), as against 7.7 lb. of margarine. Average retail

Milk Production in Principal Producing Countries

Country	In millions of pounds)		Average 1934-38
	1951	1950	
United States	116,591	117,602	105,416
France	36,350	34,080	33,000
Western Germany	33,444	30,556	18,424
United Kingdom	22,074	23,062	15,789
Canada	16,392	16,449	11,180
Netherlands	12,499	12,723	11,684
Denmark	11,541	11,931	11,780
Australia	11,357	12,848	10,176
New Zealand	11,025	10,416	10,233
Sweden	10,525	10,789	

butter prices in 1952 were estimated at 85 cents per pound, compared with 30.3 cents for margarine. Exports were smaller than the 21,900,000 lb. of 1951.

Cheese production, 1,135,000,000 lb. in 1952, required approximately 11,341,000,000 lb. of milk, or 10.3% of the total. Consumption was about 7.5 lb. per person, mostly cheddar cheese, with Wisconsin the leading producer. Prices, which averaged about 60 cents per pound, were slightly higher than a year before and above government supports. Stocks, of about 250,000,000 lb., were below the previous year. Exports were 81,000,000 lb. in 1951-52, compared with only 54,600,000 lb. in the previous year, but annual amounts as large as 308,000,000 lb. during the war period. Imports, about which there was much legislative discussion, amounted to 52,300,000 lb., compared with 56,200,000 lb. in the previous year.

Condensed and evaporated milk required 5.9% of the 1952 production, or 6,505,000,000 lb., the smallest amount in recent years and 92% of the 1951 utilization, but 34% above prewar. Stocks too were lower, and exports, very sharply reduced compared with the peak years since the war, were 28,900,000 lb. of condensed and 203,400,000 lb. of evaporated milk. Dried skim milk totalled about 785,000,000 lb., compared with 702,000,000 lb. in 1951. Consumption of 4.2 lb. per person equalled the record level of 1951. Exports, large in recent years, declined to 224,100,000 lb. in 1951-52, compared with 331,100,000 lb. in the previous year.

Ice cream used 7,230,000,000 lb., about 6.5% of all milk, or the fat from it. The product amounted to about 16.4 lb. per person, compared with 16.1 lb. in 1951, and sold at slightly higher prices than in 1951. A frozen dessert, looking and tasting much like ice cream but substituting lower priced vegetable oil for some or all the butterfat and selling at one-third to one-half the ice cream price, became a serious competitor in 1951 in Texas, Illinois, Missouri and Oklahoma.

Milk production in most of the major producing countries reached its postwar peak in 1950; though 8% above prewar in 1951 there was, nevertheless, a decline of 1% compared with the previous year. Stability, even slight declines, ruled in 1952 though some areas, particularly southern hemisphere areas hard hit by drought in 1951, increased. Consumption in 1950 per person was still 5% below prewar, but showed increased emphasis on use of fluid milk.

World total butter production, including ghee, was estimated at 8,200,000,000 lb. in 1951, compared with 8,300,000,000 lb. in 1951 and 9,600,000,000 lb. prewar. World exports of butter in 1951 amounted to about 940,000,000 lb., 10% less than in 1950 and 18% below prewar.

Trade in cheese in 1951 was 775,000,000 lb., slightly below 1950 but an increase of 30% over the prewar level. Trade declined further in 1952, the first half of the year showing a drop by 14% of imports into the United Kingdom, mostly because of smaller shipments by the U.S. and New Zealand. The ration in the U.K. was reduced from 1½ oz. per person per week to 1 oz. and the price increased.

Dams. Governments throughout the world continued their efforts during 1952 to develop their water resources through the construction of dams, although in some countries expansion of such efforts was reduced by increased military expenditures.

The accompanying table lists 15 of the important dams of the world under construction during 1952.

In the United States the federal government projects in the Columbia river basin were pushed to develop more power in the northwest. For the first time in more than 20 years, construction of dams by privately owned public utilities reached significant proportions in 1952, particularly in the northwest. The 323-ft.-high, 4,000,000 cu.yd. earth fill for the Yale dam on the Lewis river in Washington was completed. The 3,222-ft.-long earth fill for the C. J. Strike dam on the Snake river in Idaho was also completed. Also in Idaho, the 200-ft.-high arch dam on the Clark Fork river was under construction.

On the Missouri river, a thaw in early April sent melting snow surging down upon construction work at the federal government's tremendous multipurpose dams, Garrison, Fort Randall and Oahe, to slow down construction and flood the valley downstream. At Garrison, although one cofferdam was overtopped, construction work passed the halfway mark during 1952. Following the flood, closure of Fort Randall dam was carried out by the unique method of placing a chalk-fill diversion dam across the river, using a hydraulic dredge. The fill rose above the water surface on July 20, diverting the river through the twelve 22-ft.-diameter tunnels. Pieces of chalk as large as 18 in. in size were

pumped by the 30-in. dredge "Western Chief," and nearly one-third of the chalk was larger than 6 in. in size.

In Europe, Electricité de France, the nationalized power industry of France, continued work in 1952 on large dams such as Chastang on the Dordogne river, Châtelot on the Doubs river on the border with Switzerland, and Tignes on the Isère river. The latter was the highest arch dam under construction in Europe and would be 592 ft. high and 1,400 ft. long, containing more than 900,000 cu.yd. of concrete.

At Owen Falls on the headwaters of the White Nile river in Africa, two miles downstream from Lake Victoria, construction was underway by the Uganda Electricity board on a gravity dam 85 ft. high and 2,725 ft. long to generate power and provide storage for power and irrigation. The level of Lake Victoria would be raised three feet.

The tremendous irrigation and hydroelectric dams under construction in India made progress in 1952, although hampered by lack of large construction equipment. Bhakra dam, on the Sutlej river, under construction in 1952, was India's largest, and would be 680 ft. high. Nangal dam, downstream, a 95-ft.-high, 1,029-ft.-long concrete masonry structure, was 50% complete in 1952.

Construction of Eildon dam on the Goulburn river in Australia was slowed down during 1952 by curtailment of funds. The dam, a 260-ft.-high earth fill to contain 13,000,000 cu.yd., was to replace the existing Eildon weir, increasing the existing 300,000

McNARY DAM at Walla Walla, Wash., as it looked in the spring of 1952 with 13 spillway bays completed (background) and 8 bays still to be built

ac.ft. of storage by more than 2,000,000 ac.ft. for irrigation and power.

In Japan, construction was under way in 1952 on the 290-ft.-high, 800-ft.-long Maruyama dam on the Kiso river. Largest hydroelectric plant in Japan, it would have more than 100,000 kw. installed capacity.

(See also AQUEDUCTS; IRRIGATION.)

(B. O. M.)

Dance. **Ballet.**—The equality of ballet with opera and symphony was recognized in the important European music festivals. General appreciation of ballet increased. Many commendable new works were produced in 1952, but none achieved overwhelming significance.

United States.—The New York City Ballet toured Europe, appearing at Covent Garden, London, at the Paris, Berlin, Florence, Edinburgh and Holland festivals, and in Belgium, Switzerland and Spain. Lew Christensen replaced Lincoln Kirstein as administrative director, Kirstein becoming general manager of the entire City Center of Music and Drama. The company produced *Bayou*, with music by Virgil Thomson, and *Caracole*, music by Wolfgang Amadeus Mozart, both choreographed by George Balanchine; *Ballade*, choreography by Jerome Robbins, music by Claude Debussy; *La Gloire*, choreography by Antony Tudor, music by Ludwig van Beethoven; and *Picnic at Tintagel*, choreography by Frederick Ashton, music by Arnold Bax. Principal dancers were Maria Tallchief, Nora Kaye, Janet Reed, Tanaquil LeClerq, Melissa Hayden, Patricia Wilde, Diana Adams, André Eglevsky, Herbert Bliss, Todd Bolender, Nicolas Magallanes, Hugh Laing and Francisco Moncion.

Ballet Theatre toured the United States. At the Metropolitan Opera house, New York city, it produced *The Harvest Accompanying*, with choreography by Agnes de Mille, music by Thomson, and *Triptych*, choreography by Edward Caton, music by Johannes Brahms. *Graduation Ball* was revived. Alicia Alonso, Igor Youskevitch, Mary Ellen Moylan and John Kriza headed the company, with Alicia Markova, Tatiana Riabouchinska and David Lichine as guest artists.

The Sadler's Wells Theatre Ballet made its New York city debut, presenting ballets choreographed by Ashton, Ninette de Valois, John Cranko, Celia Franca and Andrée Howard. Leading dancers were Elaine Fife, Svetlana Beriosova, David Blair, Patricia Miller, Maryon Lane, David Poole, Donald Britton and Pirmin Trecu.

Alexandra Danilova and Frederic Franklin resigned from the Ballet Russe de Monte Carlo, which toured the United States and South America with Nina Novak, Leon Danielian, Gertrude Tyven and Yvonne Chouteau as stars. The Ballet Russe de Monte Carlo Concert company was organized to tour smaller communities.

The Mia Slavenska-Frederic Franklin Ballet was organized, and toured the United States and Canada with Danilova as guest artist. The company produced *A Streetcar Named Desire*, with choreography by Valerie Bettis, music by Alex North, and *Mille Fifi*, choreography by Zachary Solov, music by Theodore LaJarte.

The Jacob's Pillow Dance Festival company, directed by Ted Shawn, with La Meri, Myra Kinch, Tatiana Grantzeva, Ralph MacWilliams, Nicholas Polajenko, and Richard Stuart and Vanya, toured extensively and danced at Jacob's Pillow, where other festival artists included Peter di Falco, Carol Frishman, Nina Fonaroff, Josefina Garcia, Juana, Albia Kavan, Iva Kitchell, José Limón, Katherine Litz, Anthony Mordente, Lillian Moore and Ruth St. Denis. Choreographers' Workshop presented ballets choreographed by Robert Joffrey, Bill Hooks and Duncan Noble.

The fifth American Dance festival was held at New London,

Conn. New works included *The Queen's Epicedium*, with music by Henry Purcell, and *The Visitation*, music by Arnold Schönberg, both choreographed by Limón; *Snow Queen*, choreographed by Sophie Maslow, with music by Sergei Prokofiev; *Family Portrait*, choreographed by Jane Dudley to music by Meyer Kupferman; an abstract work by Doris Humphrey to music by Mozart; and solos by Ronne Aul.

The Dancers of Bali made their American debut. In New York city, Martha Graham choreographed *Canticle for Innocent Comedians*, with music by Theodore Ribbink. Merce Cunningham, Angna Enters, Jean Erdman, Nina Fonaroff, Emil Frankel, Erick Hawkins, Letitia Jay, Pearl Lang, May O'Donnell, Pearl Primus, Mark Ryder and Uday Shankar appeared in concerts. Choreographers' Workshop and Theatre Dance, Inc., produced experimental works, and the Dance Film society presented *Fifty Years of the Dance on Film*.

Zachary Solov began his second season as director of the Metropolitan Opera ballet. John Butler was appointed choreographer of the New York City Opera, where Charles Weidman was re-engaged. Robert Alton received the Antoinette Perry award for Broadway choreography. Florence Rogge resigned as choreographer of Radio City Music hall and was replaced by Margaret Sande. The American Fashion Critics award went to Ben Sommers for adaptation of ballet slippers for offstage wear.

In Chicago, the Stone-Camryn Ballet produced *Foo-Foo Rara*, choreographed by Bentley Stone, music by Johann Strauss. The Ballet Guild produced *The Theme*, with choreography by Charles Bockman, and revived works by Stone, Ruth Page and Walter Camryn. Loretto Rozak and Gary Roberts presented new ballets. Janet Collins, Harriette Ann Gray, Eve Gentry, Iva Kitchell, José Limón, Lillian Moore and Marina Svetlova toured extensively. The 1952 grant of the dance section of the University of International Education (Rockefeller and Ford foundations) was awarded to Haruhi Yokoyama of Japan.

For the first time, a dance script (Hanya Holm's *Kiss Me Kate*, in Laban notation) was accepted by the register of copyrights of the Library of Congress.

England.—Margot Fonteyn returned to the stage after six months' absence. At Covent Garden, London, the Sadler's Wells Ballet, directed by Ninette de Valois, produced *Sylvia*, with choreography by Ashton, music by Leo Delibes and Fonteyn in the title role. Other new ballets were *Bonne-Bouche*, choreography by Cranko, music by Arthur Oldham, and *A Mirror for Witches*, choreography by Howard, music by Dennis ApIvor. *The Three-Cornered Hat* and *Scènes de Ballet* were revived. Beriosova, transferred from the Sadler's Wells Theatre Ballet, made her Covent Garden debut. Other leading dancers included Beryl Grey, Violetta Elvin, Nadia Nerina, Michael Somes and Alexander Grant. Fonteyn received the honorary degree of Doctor of Letters from Leeds university.

The Festival Ballet, directed by Anton Dolin, appeared in London, Monte Carlo and Italy. Leading dancers were Dolin, Nathalie Leslie-Krassovska, Sonia Arova, Belinda Wright, John Gilpin and Oleg Briansky, with Colette Marchand, Yvette Chauviré and Tamara Toumanova as guest artists. The company produced *Concerto Grosso*, with choreography by Lichine, music by Antonio Vivaldi; *Vision of Marguerite*, choreography by Ashton, music by Franz Liszt; *Symphony for Fun*, choreography by Michael Charnley, music by Don Gillis, and other ballets.

The original Ballet Russe produced *Femmes d'Alger*, with choreography by Vladimir Dokoudovsky, music by Joseph Horowitz, before disbanding in January.

Peggy van Praagh was appointed assistant director of Sadler's Wells Theatre Ballet. At the Edinburgh festival, this company produced *Reflection*, with choreography by Cranko, music by John Gardner. *Île des Sirènes*, choreographed by Alfred Rodri

gues, was added to the repertoire, and *Fête Étrange* was revived.

International Ballet, headed by Mona Inglesby, toured England and danced in Verona, It. Ballet Workshop, London, produced new ballets choreographed by Cecil Bates, Jack Carter, Michael Charnley, Peter Darrell, Michael Holmes, Bert Stimmel and others.

The Dancers of Bali, Katherine Dunham, Carmen Amaya, Hima Kesarcodi, Marcel Marceau and the Yugoslav State company appeared in London, while the Continental Ballet, Ram Gopal Indian Ballet and Ballet Rambert toured England. A season of ballets choreographed entirely by Cranko was presented at Henley-on-Thames.

France.—The Paris Opera Ballet produced *Les Indes Galantes*, with music by Jean Philippe Rameau and choreography by Serge Lifar, Harald Lander and Albert Aveline. *Fourberies* was choreographed by Lifar, with music by Gioacchino Rossini, arranged by Tony Aubin. *Les Caprices de Cupidon* had choreography by Lander after Vincenzo Galleotti, and music by Jens Lolle. *Les Deux Pigeons* was revived. Principal dancers were Lifar, Liane Daydé, Lycette Darsonval, Nina Vyroubova, Alexandre Kalioujny and Michel Renault. Toumanova danced *Phedre*, *Giselle* and *Swan Lake*.

Ballets Janine Charrat presented several new works, all choreographed by Charrat: *Le Massacre des Amazones*, *Rumba Classique* and *Danseuse de Degas*, all with music by Ivan Semennoff, *Concerto*, music by Edvard Grieg, *Étrangère à Paris*, music by Jean Wiener, and *Le Rêve*, music by Liszt. This company, headed by Charrat, Ethery Pagava, René Bon and Claire Sombert, with Milorad Miskovitch as guest artist, toured France, Italy, Switzerland, Spain and North Africa.

The Marquis de Cuevas' Grand Ballet toured Europe and appeared at the Edinburgh festival and in Brazil. Headed by Rosella Hightower, Jacqueline Moreau, George Skibine, George Zoritch and Wladimir Skouratoff, the company produced *Cordelia*, with choreography by John Taras, music by Henri Sauguet; *Coup de Feu*, with choreography by Aurel Milloss and music by Georges Auric; and *Ines de Castro*, with choreography by Ana Ricarda and music by Joaquin Serra.

The Paris Opéra Comique revived *Capriccio Espagnol*. In the autumn the ballet group was dissolved, a few dancers being retained to appear in the operas.

Ballets de Marigny, headed by Yvette Chauviré, Irene Skorik, Milorad Miskovitch and Youly Algaroff, presented several ballets choreographed by Chauviré. Paul Draper and Rosario and Antonio danced in Paris. Xenia Palley received the Prix René Blum, awarded to the most promising young French dancer. The collections of the Archives Internationales de la Danse, which was dissolved, were transferred to the Paris Opera library.

Australia.—The Australian National Ballet was reorganized. Joyce Graeme and Rex Reid resigned and returned to England. Walter Gore and Paula Hinton replaced them, but later resigned. Leading dancers were Henry Danton, Arvid Fiebig, Aine Reega, Hinton and Gore. Danton produced *Pas de Quatre*, Kira Bousloff revived Lichine's *Protée*, Gore choreographed *Antonia* and *Theme and Variations* and revived *Giselle*. The company toured New Zealand.

The Kousnetzova Ballet company produced *Coppélia*, *Prince Igor* and other works. The Borovansky Ballet presented *The Sleeping Princess*, choreographed by Milo Zloch. Ballet Guild presented *The Sentimental Bloke* and *Sonata*, both choreographed by Laurel Martyn.

Austria.—The Vienna Opera Ballet produced three ballets. all choreographed by Erika Hanka: *Sylvia* (excerpts), music by Delibes, *Rondo of the Golden Calf*, music by Gottfried von Einem, and *Scheherazade*, music by Nicholas Rimsky-Korsakov. The ballet toured western Germany.

"AGE OF ANXIETY," a satiric ballet, being performed by members of the New York City Ballet in Paris, representing the U.S. in the 1952 International Exposition of the Arts

Canada.—The Winnipeg Ballet toured western Canada and presented new works by Joy Camden and Gweneth Lloyd. Participating in the annual Canadian Ballet festival, at Toronto, Ont., were the Ottawa Classical Ballet, the Elizabeth Leese

Ballet, the Gotshalks Halifax Ballet, Kay Armstrong's Ballet Concert, Toronto Ballet, Winnipeg Ballet and others.

Denmark.—The Royal Danish Ballet revived Auguste Bouronville's *Fair in Bruges*, and presented Lichine's *Graduation Ball*, Taras' *Designs with Strings* (renamed *Variationer*) and Balanchine's *Symphony in C*. The company was headed by Margarethe Schanne, Boerge Ralov, Inge Sand, Mona Vangsaa, Stanley Williams, Fredbojern Bjoernsson and Frank Schaufuss, with Niels Bjoern Larsen and Hans Brenaa as ballet masters. Fifield, Poole, Riabouchinska and Lichine appeared as guest artists.

Germany.—Ballets Jooss (Essen) produced *The Misty Way*, with choreography by Kurt Jooss, music by Aleida Montijn, and *Dithyrambus*, originally choreographed by Jooss in Chile. *Le Bosquet* and *Ball in Old Vienna* were revived, and the company toured Belgium and Switzerland.

The Berlin State Opera Ballet presented *Apollon Musagètes*, music by Igor Stravinsky, and *The Idiot*, music by Hans Werner Henze, both choreographed by Tatiana Gsovsky. The New York City Ballet, Sadler's Wells Ballet, Ram Gopal and Harald Kreutzberg appeared at the Berlin festival.

The Hamburg Opera Ballet produced *Hamlet*, with music by Boris Blacher, and *Rondo of the Golden Calf*, music by Einem, both choreographed by Helga Swedlund. For the Hanover Opera Ballet, Otto Kruger choreographed *The White Rose*, and José Undaeta choreographed *The Three-Cornered Hat*.

Greece.—Two new ballets, *Heliogenniti* and *Le Sorcier Musicien*, were presented by the company of Polyxeni Matey-Rossopoula. Choreographers were Yvonne de Kyriko and Robert Saragas.

Italy.—The La Scala Ballet, Milan, presented Balanchine's *Ballet Imperial* and produced *Reflections*, choreographed by Milloss to music by Ottorino Respighi. Ethery Pagava appeared in *Coppélia*, choreographed by Milloss. Toumanova was guest artist during the Como festival, where the repertoire included *Giselle*, *Les Sylphides*, *Daphnis and Chloe*, *The Three-Cornered Hat* and *Gaité Parisienne*.

The Rome Opera produced *Giselle*, choreographed by Boris Romanoff, with Daydé as guest artist.

Leonide Massine produced a pageant, *Laudi Evangelici*, in Perugia, and staged Rossini's *Armida* for the Florence festival.

Netherlands.—In Amsterdam, the youth ballet Scapino presented *The Tiger-Princess*, with choreography by Hans Snoek and music by Gabriel Grovlez, and *The Snowman*, choreography by Albert Mol, music by Cobie Langkester. The New York City Ballet danced at the Holland festival.

South Africa.—Nadia Nerina and Alexis Rassine, of Sadler's Wells Ballet, toured South Africa, presenting excerpts from classical ballets.

South America.—Michael Borovsky, ballet director of the Teatro Colon, Buenos Aires, Arg., choreographed *Estancia*, with music by Alberto Ginastera, and revived *The Sorcerer's Apprentice*. Alicia Markova and Roman Jasinsky appeared as guest artists in classical repertoire.

At La Plata, Arg., Nina Verchinina choreographed *Salome*, with music from Richard Strauss's opera.

In Rio de Janeiro, Braz., Vaslav Velteck choreographed *Sinho do Bonfim*, with music by Camargo Guarnieri, and *Papagaio do Moleque*, with music by Heitor Villa-Lobos. Tatiana Leskova choreographed *Salamanca do Jarau*, with music by Luiz Cosmé, and *Aurora's Wedding*, *Prince Igor* and *Les Sylphides* were revived.

In Santiago, Chile, the Sulima Classical Ballet produced *The Fountain of Bakhchisarai*, with choreography by Vadim Sulima and music by Boris Asafiev. The University of Chile Ballet, directed by Ernst Uthoff, produced his version of Stravinsky's

Petrouchka, as well as *Redes*, with choreography by Octavio Cintolesi, music by Domenico Scarlatti, and *Orpheus*, choreography by Heinz Pols, music by Stravinsky. The repertoire also included works by Kurt Jooss.

In Montevideo, Urug., Tamara Grigorieva produced *Prince Igor*, with choreography after Michael Fokine.

Sweden.—Marianna Orlando was named premiere danseuse of the Royal Opera, Stockholm, where other leading dancers were Elsa-Marianne von Rosen, Ellen Rasch, Gunnel Lindgren and Bjoern Holmgren. Serge Lifar and Nina Vyroubova appeared as guest artists in *Giselle*.

Switzerland.—At the Municipal theatre, St. Gall, Mara Jovanovits choreographed *Phoebidas und die Nymphe*, with music by Max Lang.

The Rome Opera Ballet, headed by Attilia Radice, the La Scala Ballet, the New York City Ballet and the Paris Opera Ballet visited Switzerland. For the "Semaine de la Rose," at Geneva, Harald Lander choreographed *Printemps*, with music by Grieg, and Lycette Darsonal choreographed *Reverie et Passion*, music by Hector Berlioz.

Turkey.—The Turkish National Ballet school, directed by Beatrice Appleyard, produced *Hansel and Gretel*, with music by Bulent Arel, and excerpts from *Les Sylphides*, *Swan Lake* and *Coppélia*. (LN. M.)

Ballroom Dancing.—During 1952, square dancing had a new upswing in popularity. In England this was undoubtedly the result of the interest shown by Queen Elizabeth II and Prince Philip after their visit to Ottawa, Ont., in Oct. 1951. By 1952 the British Broadcasting corporation was broadcasting square dance music, and the square dance figures were being shown and taught on television. In the United States, square dancing maintained and even increased its established popularity.

The tango continued its steady rise in popularity. Many of the old musical favourites were rerecorded and reached Hit Parade listing. The most notable tango tune revival was "Kiss of Fire," which, with new lyrics, was heard repeatedly on radio and television.

Rumba was represented everywhere in its syncopated version, known as mambo. The popular rumba tunes of 1952 were all of mambo tempo and style. Thus, rumba dancers continued to adapt syncopated jitterbug or swing step patterns to fit the mambo music.

Fox trot and waltz showed little change during the year. There were no outstanding new samba musical compositions, but the dance held its popularity with the public. This was partly because of the infectious gaiety of the music and partly because it was the easiest of all the Latin dances to learn. (A. MU.)

Deaths (of prominent persons in 1952): see OBITUARIES.

Death Statistics. For the first seven months of 1952, the number of deaths in the United States was estimated at 890,000, with a corresponding annual death rate of 9.9 per 1,000 population, the same as the rate for the like period of 1951. Since mortality is generally higher during the first half of the calendar year, which contains the heavy winter months, than in the second half, the complete annual records would be better than indicated by the figures just cited. Thus, for the whole of 1951, the United States had a death rate of 9.7 per 1,000 population, the total number of deaths being 1,486,000. This may be compared with a death

rate of 10.5 per 1,000 in 1941 and 11.1 in 1931.

Canada experienced an appreciable reduction in mortality in 1952 from the year before according to provisional data covering the first six months of both years, the decrease in deaths amounting to 5.4%. Canada reported 126,500 deaths for the entire year 1951, the death rate being 9.1 per 1,000 population. Even better than the record for Canada was that for England and Wales, where the urban communities had 17.4% fewer deaths in the first eight months of 1952 than in the like period of 1951. Total deaths for the whole of England and Wales in 1951 came to 548,918, with a death rate of 12.5 per 1,000 population. In the same year, the death rates per 1,000 in other English-speaking countries were: Scotland, 12.9; Northern Ireland, 12.9; Europeans in the Union of South Africa, 9.2; Australia, 9.7; Europeans in New Zealand, 9.6. These and other international comparisons of crude death rates are obscured by differences in the age and sex composition of their populations. A clearer picture would be obtained from a comparison of death rates for specific ages, treating each sex separately.

The death rate for the total world had been estimated to lie between 22 and 25 per 1,000 population in 1946-48 (United Nations, *Population Bulletin*, no. 1, Dec. 1951, p. 3). Within Asia (excluding Asiatic U.S.S.R.), the rate was 15 per 1,000 in Japan, between 25 and 30 per 1,000 in south-central Asia and between 30 and 35 per 1,000 in the rest of the continent. Africa had a rate that fell within a range of 25 to 30 per 1,000. In America north of the Rio Grande, the death rate was 10 per 1,000, while the countries to the south averaged 17 per 1,000. A death rate of 12 per 1,000 was reported for Oceania, north-west-central Europe and southern Europe.

Eastern Europe and Asiatic U.S.S.R. had a death rate of 18 per 1,000.

The available death rates per 1,000 population for European countries in 1951 were: the Netherlands, 7.6; Norway, 8.3; Denmark, 8.8; Sweden, 9.9; Finland, 10.0; Italy, 10.3; Switzerland, 10.5; Federal Republic of Germany, 10.6; Spain, 11.6; Portugal, 12.3; Belgium, 12.6; Austria, 12.8; and France, 13.2.

According to provisional data for the United States in 1951, the death rates per 100,000 from the leading causes of death were: diseases of the cardiovascular-renal system, 513.7; malignant neoplasms (principally cancer), 142.1; pneumonia and influenza, 31.7; tuberculosis, 19.6; diabetes mellitus, 16.5; congenital malformations, 12.2; motor vehicle accidents, 22.5; all other accidents, 38.7; and suicide, 10.4. The mortality records for the first seven months of 1952 among industrial policy holders of the Metropolitan Life Insurance company compared with the like period of 1951 showed sizable reductions in death rates for tuberculosis, diabetes mellitus and pneumonia and influenza. There were rather small reductions in death rates for diseases of the cardiovascular-renal system, suicide and accidents other than motor vehicle, which showed a rise. Cancer mortality remained practically unchanged.

The death rates per 1,000 according to age in the United States in 1951, on the basis of a 10% sample of death certificates, were: under 1 year, 31.6; ages 1-14 years, 0.8; ages 15-24 years, 1.2; ages 25-34 years, 1.8; ages 35-44 years, 3.7; ages 45-54 years, 8.4; ages 55-64 years, 18.5; ages 65-74 years, 43.5; ages 75-84 years, 94.9; and ages 85 and over, 239.5. White persons of all ages had a death rate of 9.5 per 1,000 population, compared with a rate of 10.9 for nonwhite persons. As to sex, the rate for males was 11.2 per 1,000, but that for females only 8.2 per 1,000.

A survey of reductions in mortality among the aged in the United States from 1930 to 1948 showed some very remarkable decreases (*Statistical Bulletin* of the Metropolitan Life Insurance company, July 1952). Thus, at ages 65-74 years, the death

DEATH MARCH in Munich, Ger., to protest the rising death toll from traffic accidents. Each hooded marcher behind "death on horseback" represented a person killed in Munich traffic that year

rate from pneumonia and influenza fell by 60% among white males and 73% among white females; at ages 75-84 years, the respective decreases were 51% and 64%. In the case of the cardiovascular-renal diseases, the death rate for white males at ages 65-74 years remained practically level from 1930 to 1948, but white males at ages 75-84 years and white females at ages 65-84 years experienced considerable reductions. The cancer death rate rose rather sharply among white males at ages 65-84 years; among white females there was some improvement at ages 65-74 years, but little change at ages 75-84 years. The accident fatality rate was generally down among both sexes at ages 65-84 years.

A comparison of cancer mortality according to sex among white persons carrying industrial insurance in the Metropolitan Life Insurance company showed the ratio of male to female death rates to be 1.27 at ages under 75 (*Statistical Bulletin*, June 1952). This ratio was as high as 1.42 at ages 55-64 years

and 1.48 at ages 65-74, but only .96 at ages 45-54 years. The ratio of male to female death rates at ages under 75 years was 6.5 for cancer of the buccal cavity and pharynx; 1.5 for the digestive organs and peritoneum; 7.7 for the respiratory system; 0.39 for the genital organs; and 2.5 for the urinary organs. (See also ACCIDENT PREVENTION; CENSUS DATA, U.S.; DISASTERS; INFANT MORTALITY; SUICIDE STATISTICS.) (M. Sp.)

Debt, National. The national debt of the United States at the end of fiscal year 1952 amounted to \$259,105,000,000, about \$4,000,000,000 higher than a year earlier. (See Table I.) In a statement dated Aug. 19, 1952, reviewing the 1953 budget submitted to congress the previous January, Pres. Harry S. Truman reported that the national debt would be further increased to an estimated \$267,505,000,000 by June 30, 1953. The increase was attributed very largely to a sharp prospective rise in the budget deficit.

Table I.—National Debt of the United States

	June 30	(Millions of dollars)		June 30	(Millions of dollars)
1915		1,191	1945		258,682

Source: Data from 1915 to 1952 are from U.S. Department of the Treasury, daily treasury statement (revised); 1953 is estimate from "Statement by the President Reviewing the 1953 Budget" (Aug. 19, 1952).

The marked rise in public debt after fiscal year 1951 followed a substantial reduction during the 1946-48 period and an irregular, moderate increase over the 1949-51 period. The public debt as of June 30, 1952, was about \$20,000,000,000 below the peak total of \$279,214,000,000 reached at the end of Feb. 1946.

The post-World War II debt-retirement program of the U.S. treasury involved a large reduction in marketable interest-bearing securities. From March 1946 through June 1952, the reduction in such securities amounted to \$59,400,000,000. (See Table II.)

Table II.—Decrease in Marketable Interest-Bearing Public Debt*

	March 1946- June 1947	1948	Fiscal year ending 1949	1950	1951	1952
Treasury bills	1,257	2,018	2,221	—1,997	—81	—3,605

Table III furnishes data on the sources of funds for the reduction in the marketable interest-bearing public debt. During the last ten months of 1946, the funds used to retire aggregate maturities of \$23,197,000,000 were obtained chiefly from the general fund cash balance accumulated by the Victory Loan drive. In the period Jan. 1947-June 1951, funds for reducing the marketable public debt were derived mainly from the growth in nonmarketable issues.

With respect to federal debt management, a matter bound up closely with monetary policy, developments in 1952 reflected continued effective functioning of the agreement reached in March 1951 between the treasury and federal reserve, the agen-

cies charged with responsibility in this general area. The nature and significance of this agreement and of subsequent developments can best be viewed against the background of previous debt management operations.

Table III.—Sources of Funds for Reduction in Marketable Interest-Bearing Public Debt

	March 1946- June 1947	1948	Fiscal Year Ending 1949	1950	1951	1952

The maintenance of order and stability in the government bond market—a policy initiated in the pre-World War II period—was a primary objective of the debt management program in the war and postwar periods. In line with this objective, the pre-war structure of interest rates was maintained with only minor variation during the war, permitting the authorities to finance cheaply the huge requirements of war finance.

In the postwar period, the stabilization of the government bond market, a joint treasury-federal reserve function, required different policies to meet changing conditions. Beginning in the spring of 1947, for example, several steps were taken to control an incipient boom in the government bond market. But in 1948, when a downward pressure on government bond prices developed, the federal reserve system supported the market through substantial purchases of government bonds from investment institutions and other nonbank holders seeking to acquire funds for lending. The prices of the longest-term issues were stabilized at slightly above par.

While pursuing the broad policy of stabilizing the market for government securities, treasury and federal reserve authorities adopted numerous measures designed to combat postwar inflation. Among them may be noted: (1) the substantial reduction effected in bank ownership of federal securities (see Table IV); (2) permitting interest rates to rise on short-term government securities from mid-1947 until the fall of 1948; and (3) raising by approximately \$3,000,000,000 in 1948 the amount of reserves required to be held by member banks to prevent the additional reserves created by federal reserve support purchases from becoming the basis for multiple credit expansion.

Table IV.—Estimated Ownership of Federal Securities—Public Debt and Guaranteed Securities

	June 1947	June 1948	June 1949	June 1950	June 1951	June 1952
Total federal securities outstanding	258.4	252.4	252.8	257.4	255.3	259.2
Total held by banks	91.9	85.9	82.4	83.9	81.4	84.1

In 1949, with the abatement of inflationary pressures and moderate downturn of business activity, the federal reserve board reduced the reserve requirements of member banks in

order to make credit more freely available. The ensuing strong bank demand resulted in sharp increases in the prices of government securities. To maintain orderly conditions in the money markets, the federal reserve sold short-term securities in considerable volume; but it discontinued the practice of freely selling government bonds. This compromise policy moderated the decline in yields on short-term government securities but permitted market forces to depress sharply the yields on medium and long-term government bonds, thereby encouraging investors to seek municipal and corporate securities and mortgage loans as outlets for their funds.

After the Korean outbreak in mid-1950, several steps were taken to restrict credit expansion without disturbing the stability of the government bond market. Nevertheless, in this period the total demand for long-term credit considerably exceeded the supply of funds becoming available from new savings and repayment of outstanding loans. Insurance companies and banks sold government bonds in heavy volume in order to meet this surplus demand, and the federal reserve system purchased the excess not bought by private investors so as to prevent declines in government bond prices.

Such support purchases by the system increased both the money supply and the reserves available to banks for expanding credit.

The treasury-federal reserve "accord" achieved in March 1951 marked a major shift in debt management (and monetary) policy. In its government security transactions the federal reserve system began placing greater emphasis on the supply and availability of bank reserves and less emphasis on maintaining fixed prices of government bonds. The system restricted its purchases of government securities and thereby reduced the supply of reserves made available to the banks. The prices of government securities were permitted to decline with market evaluations, and several of the long-term issues fell below par. Banks and other investors became less willing to convert their government securities at a market loss. The federal reserve regained considerable control over the availability of bank reserves and a firmer money market and gradual rise in interest rates consequently developed.

Also in accordance with the March 1951 agreement, the treasury acted to immobilize part of the publicly held debt. It offered in exchange for the two longest-term $2\frac{1}{2}\%$ bonds an issue of nonmarketable bonds with a longer term and higher interest coupon. The purpose was to encourage long-term investors such as insurance companies to retain their government securities, and thereby to minimize monetization of the public debt.

Table V.—Debt of State and Local Governments, U.S.

June 30	(Millions of dollars)				
	Total	State	County	City and township	School district and special district
1929	17,234	2,300	2,270	9,259	3,405
1933	19,985	3,018	2,521	10,577	3,869

Source: U.S. Department of Commerce.

The effect of the change in debt management and monetary policy was evident in the methods of financing the large cash deficits of the second half of 1951 and of 1952. These deficits, stemming from the concentration of federal tax collections in the first half of the year and the uptrend in defense spending,

were financed with the aim of minimizing increases in bank deposits and reserves so as to hold down the potential inflationary impact. In general, the financing methods entailed, in addition to drawing on the general fund balance, the sale of securities (1) to nonbank investors (such as the sale of tax anticipation bills to corporations for use as tax payments the next March and June) and (2) to banks without, however, accompanying federal reserve open-market purchases that serve to create new bank reserves.

In President Truman's Aug. 1952 statement reviewing the 1953 budget, it was estimated that total payments of interest on the public debt in fiscal 1953 would amount to \$6,350,000,000—\$500,000,000 more than outlays in fiscal 1952.

U.S. State and Local Government Debt.—The latest official estimates available in 1952 of the aggregate debt of state and local governments in the U.S. are shown in Table V. State and local debt in 1951 was 70% higher than in 1946 and 40% higher than in 1940. It was evident that such indebtedness showed a further marked rise in 1952. New capital (over and above funds for refunding purposes) raised by state and local authorities in the year ending June 30, 1952, amounted to \$4,000,000,000.

Table VI.—National Debt of Various Countries

Country (Unit of currency)*	Date	Total debt (000,000s)	Date	Total debt (000,000s)

Other Countries.—In Table VI are presented data on the national debts of many countries of the world. Insofar as permitted by available information, the data are shown for 1939

and for a late postwar year, affording a comparison of national debts before and after World War II. (See also BUDGET, NATIONAL.) (C. F. Sz.)

Defense, U.S. Department of: see BUDGET, NATIONAL; GOVERNMENT DEPARTMENTS AND BUREAUS, U.S.

Defense Mobilization Agencies, U.S.: see DEFENSE PRODUCTION ADMINISTRATION; ECONOMIC STABILIZATION AGENCY; PRICE STABILIZATION, OFFICE OF; RENT STABILIZATION, OFFICE OF; WAGE STABILIZATION BOARD.

Defense Production Administration. The Defense Production Administration (DPA) was created by executive order on Jan. 3, 1951, under authority of the Defense Production act of 1950, to exercise general direction of the nation's defense production program. It functions under the Office of Defense Mobilization.

Primarily a policy-making agency, DPA directs, co-ordinates and reviews defense production activities performed by the appropriate departments and agencies within the framework of the executive branch. DPA performs its varied functions by assigning responsibility to three groups: delegate agencies, who have been given authority by DPA to take actions within their governmental jurisdiction to further the needs of the defense mobilization program; claimant agencies, who have been designated by DPA to submit materials requirements for programs for which they are assigned responsibility; and financing and procurement agencies, who implement approved programs for the expansion of capacity.

Delegate Agencies.—Four delegate agencies, in meeting the responsibilities assigned to them by DPA, issue priorities and allocations of materials and make recommendations for issuance of certificates of loans to private business for expansion of production, for issuance of tax amortization certificates and for approval of voluntary agreements. The department of the interior has jurisdiction with regard to petroleum, gas, solid fuels and electric power; the department of agriculture, with regard to food for industrial needs; the Interstate Commerce commission, domestic transportation, storage and port facilities, or the use thereof, excluding air transport, coastwise, inter-coastal and overseas shipping; and the department of commerce, with regard to all materials and facilities not elsewhere assigned. The fifth delegate agency, Defense Materials Procurement agency, has the responsibility of certification of essentiality of loans to the Reconstruction Finance corporation and the Export-Import bank to the extent that such loans are a part of and in accordance with the terms of programs certified by the defense production administrator.

Claimant Agencies.—The claimant agencies have the responsibility of determining the materials requirements for meeting the needs of the military establishment and the civilian economy within the area of their individual limitations.

The department of the interior, a delegate agency as well as a claimant, acts through the secretary in requesting materials for departmental programs such as production, preparation and processing of solid fuels. Within the department of the interior, the Petroleum Administration for Defense acts as claimant for the production, processing, refining and distribution of petroleum and gas.

The department of commerce contains three claimants: the office of international trade, acting with respect to all exports with certain exceptions; the National Production authority, claimant for production of materials and products not elsewhere assigned, related production equipment, related industrial facility construction, civilian communications, water and sewage facilities and other NPA programs; and the secretary of com-

merce, who acts as claimant for the maritime administration, bureau of public roads; civil aviation programs for which the Civil Aeronautics administration and the Civil Aeronautics board are responsible, and other department programs except as otherwise specified above.

The department of defense acts as claimant through its secretary for all of its programs, including military equipment and supplies under the Mutual Defense Assistance program, military construction and all housing on military bases and reservations, stock pile and civilian requirements of foreign areas under military administration, program requirements of the National Advisory Committee for Aeronautics, coast guard and central intelligence agency. The department of the army is claimant for civil construction projects under its jurisdiction except projects having electric power generating capacity or facilities, which are otherwise assigned.

The department of agriculture acts as claimant for farm production and construction, food processing and distribution.

The independent agencies in government who act as claimants within their jurisdiction are: Mutual Security agency; Veterans administration; Federal Civil Defense administration; Atomic Energy commission; Defense Transport administration; Housing and Home Finance agency; Federal Security agency; Defense Materials Procurement agency; and General Services administration.

Financing and Procurement Agencies.—The primary functions of these agencies is to administer the programs approved by the congress to provide incentives to private industry to expand industrial production to meet the demands of the defense mobilization program and maintain, simultaneously, a healthy civilian economy.

The Defense Materials Procurement agency purchases and makes commitments to purchase metals, minerals and other materials for government use or resale; encourages exploration, development and mining of critical and strategic minerals and metals; makes subsidy payments necessary to maintain essential production; and makes installation in government-owned and private plants, factories and facilities.

The Export-Import Bank of Washington acts as financing agent for foreign loans to implement the defense mobilization program.

The Reconstruction Finance corporation serves in the same capacity for domestic loans.

The major emphasis in 1952 was on expanding the nation's production to meet the demands of the defense mobilization program. Expansion goals were set for approximately 170 products and materials and the majority of the necessary expansion was aided by incentives to private industry provided by congress. By making a determination of the required expansion within an industry to meet the demands of the defense mobilization program and thus establishing an expansion goal, a clear concept was reached of the over-all requirements of the program. Goals remained to be set for about 100 materials and products. When all expansion goals were reached, the nation would have the capacity needed, when fully utilized, to meet military, defense-supporting and essential civilian requirements under the defense mobilization program. The problem at the close of 1952 was to identify the specific gaps which still remained through use of increased knowledge and ability to estimate the nature of full mobilization. Delaware. Delaware, on the middle Atlantic seaboard, one of the original 13 states of the United States, is called the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. The "Diamond state" is also a popular name. Area 2,057 sq.mi. (land 1,978 sq.mi.; inland water 79 sq.mi.). Population (1950 U.S. census) 316,715 compared with (1940) 266,505. Of the latter, native white numbered 215,695; foreign-born 14,913; Negro 35,876.

History.—A special session of the Delaware general assembly called by Gov. Elbert N. Carvel in Dec. 1951, appropriated \$1,743,840 to increase the uniform state-supported salary schedule for all public school staffs and employees in 1952.

The chief state officers in 1952 (preceding the November election) were: governor, Elbert N. Carvel; lieutenant governor, Alexis I. du Pont Bayard; secretary of state, Harris B. McDowell, Jr.; tax commissioner, Howard S. Abbott; bank commissioner, Randolph Hughes; chancellor, J. Collins Seitz; attorney general, H. Albert Young; insurance commissioner, William L. Murphy; state treasurer, Ralph W. Emerson; state auditor, George Daniel Enterline; adjutant general, Brig. Gen. Joseph J. Cannell; director, legislative reference bureau, Robert W. Gunnell.

Education.—The \$16,500,000 school building and plant improvement program provided for in 1951 was well advanced on Oct. 1, 1952.

The cost of operating the public schools in the fiscal year, June 30, 1951, to June 30, 1952, was \$13,700,000, compared with \$11,816,938 the previous year. The expenditure per pupil in average daily attendance was \$314.14 compared with \$280.65 in 1950-51. Elementary schools had an enrolment of 31,506 and a teaching staff of 1,107. Secondary schools had an enrolment of 18,061 and teaching staff of 959. From Jan. 1 to Oct. 1, 1952, the state board of vocational education placed 315 disabled persons in earning jobs. The state superintendent of public instruction in 1952 was George R. Miller, Jr.

Social Insurance and Assistance, Public Welfare and Related Programs.—State unemployment compensation paid for the fiscal year ending June 30, 1952, was \$1,038,706; active claims on that date were 1,237. The cost outside relief, Jan. 1 to Sept. 30, 1952, was \$351,950 for an average 800 cases per month. The cost was shared half by the state and half by the county in which the relief was given. In Oct. 1952, 1,757 persons were receiving old-age assistance.

During the fiscal year ending June 30, 1952, 847 children were cared for in their own or foster homes at a cost of \$342,083; the number of dependent children aided was 3,152 at a cost of \$773,761. The state appropriation for public welfare was \$3,887,573, exclusive of grants to semi-public institutions and agencies. The New Castle County Workhouse which accepts long-term prisoners from the other counties (there is no state prison) received 2,656 prisoners and discharged 2,634 during the fiscal year. On June 30, 1952, there were 344 inmates.

Communications.—The mileage of all highways and rural roads was 926. The income of the state highway department for the fiscal year was \$1,030,906, including federal aid of \$1,646,773. Railroad mileage was approximately 270.

For the nine months, Jan. through Sept. 1952, tonnage at the port of Wilmington was 479,067; value of cargoes, \$30,340,634. On Oct. 1, 1952, the state had 133,717 telephones in use.

Banking and Finance.—On June 30, 1952, there were 54 state banks, trust companies, branch banks and offices having total resources of \$614,410,173. The assets of the eleven national banks were \$35,784,790.84, making the total resources of all Delaware banks \$650,645,808.14. (Two national banks had been purchased by two state banks.)

Total state receipts for the year ending June 30, 1952, were \$56,000,000, of which \$25,000,000 was from taxes and \$30,000,000 from special and receipts. The cash balance at the beginning of the year was \$30,000,938. Expenditures were \$63,776,657. The gross debt was \$42,937,000, and total debt service (interest and redemptions) amounted to \$2,618,768.

Agriculture.—The estimated total cash income from agricultural production in 1952 was \$105,682,000, of which \$83,402,000 was from live-

Table II.—Principal Industries of Delaware

Industry	1952	1951
Food	\$79,555,197	\$53,664,188
Clothing	115,394,061	19,782,981
Household supplies	6,938,235	961,488
Auto supplies	5,308,584	8,568,939
Drugs and medical supplies	3,119,507	16,923
Tobacco	3,769,944	3,598,239
Miscellaneous	239,624,642	128,283,488

Manufacturing.—Gross receipts of 709 licensed manufacturers for the year ended June 30, 1952, were \$453,790,170, compared with 710 for the previous year with gross receipts of \$214,876,246. The total number of employees under the unemployment compensation law June 30, 1952, was 117,038. Total wages paid for the year ended June 30, 1952, were \$399,622,143. The Wilmington area quarterly survey of employment, Aug. 15, 1952, showed 68,312 employed by 583 employers compared with 65,977 by 550 employers on the same day in 1951. New corporations chartered at Dover for the year ended June 30, 1952, were 2,767, compared with 2,592 the previous year. Corporations that became void numbered 965 compared with 1,171 the year before. (J. EN.)

Mineral Production.—Delaware has the smallest mineral output of any state, and that entirely in building materials. In 1949 the output included 33,212 short tons of clays (\$46,293), 233,977 tons of sand and gravel (\$196,541), and 37,240 tons of stone (\$92,100); total value \$334,844. In 1950 output increased to 41,000 tons of clays (\$40,375), 367,524 tons of sand and gravel (\$291,715) and 77,050 tons of stone (\$190,113); total value \$522,203. Data for 1951 were not yet available.

Democracy. The term democracy in this article means that form of government and way of life which was developed, following the example of 17th century England, in the constitutional struggles of western Europe and North America in the 18th and 19th centuries. Democracy in this sense is based upon a multiparty representative system in which the voters have the choice among alternative and opposed administrations, upon respect of individual liberty and freedom of discussion and expression in the political and cultural fields, and upon the independence of the judiciary from political or administrative influence.

Democracy in the western sense represented an entirely new departure in history by not treating opposition as a hostile force but by striving to make it a constructive part in the process of government. Communists and fascists reverted to a predemocratic strictly authoritarian form of government, suppressing all political and cultural opposition and even diversity. They not only insisted upon the "immorality" of western democracy which they called "plutocracy," but also upon its inability to cope with the problems of modern technological mass civilization. They predicted the early and inevitable decay of western democracy as the result of social disintegration, of party strife and slowness of parliamentary deliberations, and of the supposedly inevitable economic crises in a not entirely planned and centrally directed society.

Contrary to these predictions, democracy in 1952, as in the preceding years, showed no sign of collapse. The weakness of democracy in certain attitudes, which had been apparent before and immediately after World War II and which had much encouraged fascists and Communists to expect an easy victory over democracy, was due not to any intrinsic defect but to a lack of understanding of the nature and intentions of the antidemocratic forces, and therefore to a lack of that vigilance which is indispensable for the preservation of liberty. This awareness was largely absent before World War II with regard to the threat of fascism, and immediately after World War II with regard to the threat of communism. All this changed after 1947 through the increased co-operation of the democracies and the revitalization of their faith in their own way of life. Even in Italy and France, where communism continued in 1952 to exercise a strong appeal among a large part of the working class, of the peasants and of the intellectuals, Communist influence was not strong enough, in spite of all its efforts, to impede the rearmament of these nations with the help of the United States and their co-operation in the North Atlantic Treaty organization. Mass strikes called in these countries as a protest against the disembarkment of U.S. weapons and against the visit of Gen. Matthew B. Ridgway, who was

stock, \$21,918,000 from crops and \$362,000 government payments—compared with actual figures for 1951: total cash income \$112,958,000, restock \$89,078,000, crops \$23,409,000, government payments \$471,000.

appointed commander in chief of the North Atlantic forces as successor to Gen. Dwight D. Eisenhower, petered out ineffectually. The French government felt encouraged to adopt stronger measures against the Communist party.

Outside Italy and France, no other European country which was not directly under soviet control showed any appreciable strength of antidemocratic forces. Even countries "in the shadow" of the soviet military machine like Finland and Austria clung staunchly and defiantly to the democratic way of life. The few elections held in European countries during 1952 witnessed everywhere a strong decrease of Communist votes. In Germany, elections were held in March 1952 for the constituent assembly of the newly formed state of Baden-Württemberg. The Communists received 119,631 votes or 4.3% of the total, compared with 175,910 votes or 6.4% of the total at the last elections held in 1949. In the new assembly they formed the smallest party with four deputies out of 121. The neofascist party, the Sozialistische Reichspartei, received only a little more than 2% of the vote and did not elect any deputy.

Elections in countries with a firmly rooted democratic tradition, in the Netherlands in June and in Sweden in September, brought no surprises. In the Netherlands the Labour party emerged as the strongest single party, closely followed by the Catholic People's party. The Labour party received almost 300,000 votes more than at the last elections in July 1948, and gained this added strength at the expense of the Communists, whose vote represented only 6.2% of the total compared with 7.7% in the last elections and who lost two of the eight seats which they formerly held in the chamber. The Swedish elections were won by the ruling coalition of Social Democrats and Agrarians, but by a smaller margin. The Liberals and the Conservatives made appreciable gains, while the Communists lost heavily, having in the new parliament only 5 deputies among 230 compared with 8 in the previous chamber.

Less encouraging was the picture for democracy in Latin America, where semifascist nationalist forces, influenced by the example of Peronism in Argentina, frequently combined forces with Communist and Communist-inspired movements. On the other hand, two key countries in Asia showed in their elections that the democratic process was slowly striking roots there. At the beginning of the year elections in India not only brought success to the Congress party under the leadership of prime minister Jawaharlal Nehru, but they were held in a surprisingly orderly way, notwithstanding the fact that many of the voters were illiterate people becoming familiarized for the first time with the democratic voting system. Japan held its first elections under the newly gained sovereignty on Oct. 1. Though the Liberals who had been in power in the preceding chamber lost 45 seats, they still remained, with 240 deputies out of 466, the majority party. The Progressives, who were perhaps the most outspoken party for rearmament on the side of the democracies, gained 18 seats and became the second strongest party. These victories and the complete defeat of the Communists pointed to a Japanese determi-

ABOARD THE U.S. COAST GUARD cutter "Courier," first U.S. sea-going radio station for the "Voice of America." The floating transmitter began operation in 1952, beamed mainly at nations in the soviet bloc. A barrage balloon shown being readied to lift the antenna for the ship's main transmitter

nation to stand with the democracies. The Communists, who had 22 representatives in the former chamber elected in 1949 and U.S. occupation, were unable in 1952 to gain even one seat; the total vote fell from 3,000,000 in 1949 to 837,000 in the 1952 election. The young Japanese democracy rejected not only the Communists but also the extreme nationalist candidates.

Less surprising was the strength of the democratic forces shown in the elections in Ceylon. This former British colony had under the leadership of D. S. Senanayake achieved a moderate peaceful transition to an independent member of the British Commonwealth. After Senanayake's death in the spring of 1952 his Cambridge-educated son, Dudley Senanayake, formerly minister of agriculture, became the leader of the United National party. It gained 54 of the 101 parliamentary seats and with the help of some smaller parties formed a government disposing of 70 votes. The Communists suffered a loss, the Stalinists retaining only 3 seats, and a semi-Trotskyite party receiving only 10 seats instead of the 18 which it had had in the previous parliament.

One of the most important elements in the growing strength of democracy in 1952 was the progressive development of democratic federalism in the movements aiming at the creation of a European Union and, on a wider scale, of an Atlantic union which would include the democratic countries of western Europe and North America. This democratic federalism, a development which began only in 1948, had its foundation in the need for common defense against totalitarian aggressiveness. In spite of the novelty of the movement, which implied everywhere a break with long-standing traditions of national policy and sentiment, it had by 1952 not only led to initial successes but began to extend beyond its immediate purpose toward the goal of closer cultural and economic integration of the various nations with a common democratic heritage. The fact that in the presidential elections of the fall of 1952 in the United States both candidates and both parties stressed the need for a closer cooperation among the democratic nations, strengthened the trend toward democratic federalism on a wider basis. Due recognition was given to the importance of this movement by the sov-

premier Joseph Stalin in his article published at the beginning of Oct. 1952, in which he based the hope for Communist victory on a split between the United States and its chief European allies. Democratic Party: see POLITICAL PARTIES, U.S.

Denmark. A monarchy of north central Europe, Denmark has an area of 16,569 sq.mi. Pop.: (1950 census) 4,281,275; (1951 est.) 4,303,000. Capital: Copenhagen (768,105, or including suburbs 1,168,340). Other principal cities (1950 census): Aarhus (116,167); Odense (100,940); Aalborg (79,806). Religion: Lutheran Christian. Ruler in 1952: King Frederick IX; prime minister: Erik Eriksen.

History.—In 1952 Denmark, like many other countries, was waging two major campaigns—one for economic security, one for political security.

Denmark's financial reserves were small, but by May 1952 the country could look forward to equilibrium in its balance of payments, possibly a slight surplus by the end of the year. Exports to the dollar lands of the western hemisphere were up compared with 1951, and import policies were liberalized. Of the 1948 list of imports, 76% were on the free list by 1952 (though for certain textiles a percentage deposit in the National bank was required). Coffee went off rationing leaving only sugar restricted by October. Employment remained at a high level. The price front, however, could not be held. An increase on the state subsidy kept milk at the old price, but ceilings were raised on butter and eggs. Government allowances were increased for grain and children's footwear. The higher governmental costs then had to be met by a shipping tax and a raise in postal rates.

The Danes fought for their outside market, the most important move being new negotiations on prices of farm products sold to Britain.

The government also urged the U.S. to ease restrictions on cheese imports into that country. The Danish argument was that the U.S. did not need such protection when it sold to Denmark (in 1950) \$54,000,000 worth of goods, but bought from that country a total of only \$12,277,000. In January the U.S. senate shelved this question in committee, but on July 3 slight modifications were granted through setting new quotas by varieties.

Denmark's total cost for maintaining about 200,000 refugees after World War II was 429,000,000 kroner (180,000,000 kroner for the period up to May 1, 1946); the Danish delegation to a conference in London on the problem of repayment agreed to accept 160,000,000 kroner in 20 annual payments.

A dilemma confronted the government when the time came, in July, to deliver a 13,200-ton tanker to the Soviet Union. A Copenhagen firm had built the tanker on a contract of 1948, prior to any restrictions on sales to the east. But the U.S. government protested that the ship came in the category of strategic materials, and that such shipments to "iron curtain" countries were banned for all countries receiving U.S. aid (by the Battle act). Danish parliamentary leaders of all five parties held a special session on the question and approved the governmental decision to carry out the contract. Delivery was made on July 7. Pres. Harry S. Truman accepted the situation as being a special case, and ruled that aid to Denmark should not be cancelled; cancellation, he said would but weaken the North Atlantic

Treaty organization and strengthen the U.S.S.R., but he deplored the delivery and expressed his opinion that the aggressive intentions and actions of the Soviet Union should override the legal Danish argument of contract fulfilment.

Foreign Minister Ole Bjørn Kraft continued to promote proposals for intimate co-operation among the Scandinavian states, including a plan for a permanent Scandinavian parliamentary council. One practical step was consummated in July with the abandonment of passports among the northern countries.

For the strengthening of Danish collaboration in NATO the term of military service was (Dec. 12, 1951) extended from 12 months to 18 months. This would provide an additional division of 18,000 men, and would give Denmark by the end of 1952 an army of 100,000, a navy of 25,000, an air force of 15,000. local and home defense forces of 70,000 and a home guard of 40,000.

Denmark was an eagerly interested participator in the manoeuvres of the North Atlantic Treaty forces in Sept. 1952, much of which took place in or around its lands and seas. It continued to be disturbed by soviet captures of Danish fishing ships in the Baltic, and reacted strongly when the Russians shot down two Swedish planes. Discussions continued regarding the stationing of U.S. Thunderjet fighter planes in Jutland, a step which the U.S.S.R. threateningly condemned.

King Frederick IX and Queen Ingrid made a state visit in the summer to Greenland. Greenland's connection with Denmark was again emphasized when information was published about the U.S. air base at Thule; the Scandinavian Airlines system quickly announced its interest in using Thule as a base on a route from Copenhagen to California, and hoped to begin scheduled flights by June 1953. (See also GREENLAND.) (F. D. S.)

Education.—Schools (1950-51): elementary, middle and secondary 4,107, pupils 532,184; technical 371, pupils 60,224; commercial 208, pupils 32,680; agricultural 27, pupils 2,721. Teachers' colleges 21, pupils 3,603. Universities 2, professors and lecturers 275, students 5,683; other institutions of higher education 8, students 5,465.

Finance and Banking.—Budget: (1951-52 est.) revenue 2,569,000,000 Kr., expenditure 2,573,000,000 Kr.; (1952-53 est.) revenue 2,511,000,000 Kr., expenditure 2,507,000,000 Kr. Real public debt (1951): 4,970,400,000 Kr. Currency circulation (Aug. 1952) 1,643,000,000 Kr. Bank deposits (Aug. 1952) 6,135,000,000 Kr. Gold and foreign exchange (July 1952) U.S. \$110,000,000. Monetary unit: krone, with an exchange rate of 19.34 Kr. to the pound and 6.92 Kr. to the U.S. dollar.

Foreign Trade.—(1951) Imports 6,976,000,000 Kr., exports 5,784,000,000 Kr. Main sources of imports (1951): U.K. 26%; Germany 14%; U.S. 11%; Sweden 8%; France 6%. Main destinations of exports: U.K. 38%; Germany 15%; Sweden 5%; Norway 4%. Main imports: coal, petroleum and products 18%; textiles 15%; machinery and vehicles 11%; wood, paper and manufactures 9%. Main exports: dairy products 27%; meat and products 24%; machinery 8%; live meat animals 7%.

Transport and Communications.—Roads (1952): 33,165 mi. Licensed motor vehicles (Dec. 1951): cars 189,288, of which commercial 73,407. Railways (1951): 2,962 mi.; passenger-miles 2,050,000,000; freight, ton-miles 814,000,000. Shipping (merchant vessels of 100 gross tons and over, Dec. 1951): 767; total tonnage 1,389,000. Air transport (1951): passenger-miles 370,000,000; cargo, ton-miles 47,000,000. Telephones (1951): 723,443. Radio receiving set licences (1951): 1,162,154.

Agriculture.—Main crops (metric tons, 1951): wheat 275,000; barley 1,730,000; oats 780,000; rye 230,000; potatoes 1,952,000; sugar, raw value 350,000. Livestock (July 1952): cattle 3,057,000, including 1,473,000 dairy cows; sheep 51,000; pigs 3,632,000; horses 423,000; goats (July 1949) 3,820,000; poultry 23,411,000. Dairy products (metric tons, 1951): milk 5,232,000; butter 168,000; cheese 74,400. Meat production (metric tons, 1951) 603,000, of which beef and veal 207,000, pork 395,000. Index of livestock production (on basis of 1949=100, 1951): 123. Fisheries (1951): total catch 292,450 metric tons.

Industry.—Industrial establishments (June 1948): 102,303; persons employed 684,939. Fuel and power (1951): coal, distributed 10,762,000 metric tons; manufactured gas 386,400,000 cu.m.; electricity 2,137,200,000 kw.hr. Cement production (1951) 987,600 metric tons. New dwelling units completed (1951) 21,538. Index of total industrial production (1948=100; 1951) 120.

Dentistry. The Eleventh International Dental Congress of the Federation Dentaire Internationale met in London, Eng., in July 1952. Representatives of about 40 countries of the free world attended. During the meeting, emphasis was placed on the prevention of dental diseases and the need for a better understanding of their causes, on research, on dental

PHOTOMICROGRAPH of a tooth section using the natural phosphorescence of human teeth to reveal new details of tooth structure. The technique, developed at the national bureau of standards in 1952, was expected to help in explaining the mechanism of tooth decay

health procedures and on education. Operative techniques received less emphasis than in the past.

The fluoridation of public water supplies continued to be a highly controversial subject, particularly in certain areas. On Aug. 25, San Francisco, Calif., began to fluorinate its water. An estimated 80% or 650,000 of the city's population was to be served by this procedure.

On Oct. 1, an estimated 429 communities in 42 states and the District of Columbia were fluoridating their water supplies. Nearly 300 additional communities had approved the measure and were making plans to place it in operation. Among large cities where fluoridation was in operation was Chattanooga, Tenn., which also supplied water to five near-by communities. Chattanooga was the 16th city of more than 1,000 persons to add fluorides to its water supply.

It had been shown that this procedure reduces the incidence of dental caries up to 60%.

The airbrasive technique for removing decay in teeth and preparing them for filling continued to arouse interest and its use had increased. However, the question was raised whether some of the fine particles of the abrasive that escape the exhaust apparatus does harm to patients who have respiratory infections. The question also arose as to whether the operator who works with the apparatus constantly may be subjected to an occupational hazard.

No data on either of these questions existed but investigations were going on to determine the hazards. Much depended on the ability of the operator successfully to make use of the exhaust end of the appliance.

Cracks at corners of the mouth had long disturbed patients and had challenged both the medical and dental professions. It had been rather generally accepted that true cheilitis is associated with a riboflavin deficiency. But false or pseudocheilitis seemed to appear in people who wore full dentures and where

the vertical dimension of the occlusion had been reduced and also where the dentures were not worn at night. It was reported that lesions resulting from reduced intermaxillary space slanted downward and outward, whereas the true cheilitis associated with riboflavin deficiency was more horizontal.

In the false variety where the lesions are produced by a reduction of the vertical dimension, the upper lip overhangs the lower, producing a fold at the corners of the mouth. It was believed that moisture from retained saliva in the fold, together with bacterial and mechanical irritation, produced the lesions.
(L. M. S. M.)

Dermatology. Psoriasis is a disease that afflicts thousands of persons and interests thousands more because of its tendency to be familial. In 1952 recent study of the genetics of psoriasis, based on information obtained from 464 consecutive patients with the disease, showed: a predominance of male patients essentially the same as the predominance of males in these families; no relation between the sex of the patient and that of his or her affected parent or sibling; and no relation between birth order and the occurrence of psoriasis. The incidence of psoriasis among patients with nonpsoriatic parents was 2.45%, with one psoriatic parent 9%. There were no patients in the group with two psoriatic parents. The incidence of psoriasis among the patients' parents was 5.9%. The data indicated the presence of a hereditary component in the causation of psoriasis, a minimum of two genes.

Estrogenic substances had been used with success for the treatment of such widely different diseases as hereditary haemorrhagic telangiectasia, diseases affecting the sebaceous glands (especially senile sebaceous adenoma) and some fungal infections.

Persons with hereditary haemorrhagic telangiectasia, because of the presence of tiny dilated capillaries in the skin and mucous membranes, suffer from repeated nosebleeds and occasionally from rectal bleeding, haemorrhagic spots on the lips, tongue, etc. In one patient, because there was an apparent relationship between the recurrent haemorrhages and the menstrual cycle, treatment with estrogenic substances was instituted and effected control of the bleeding. Similar treatment then was used successfully in four other patients, two of them men who required concomitant treatment with male sex hormones to combat feminizing side effects of the estrogens. All of the patients were in their 40s or 50s. In all of them there was an apparent restoration of normal texture to the nasal mucous membrane and a tendency for the dilated capillaries to disappear during treatment.

The use of estrogenic substances to ameliorate cancer of the prostate in two men led incidentally to the development of chemically related compounds for the treatment of blastomycosis, a higher type fungal infection that sometimes resists treatment stubbornly. The first two patients both had inoperable cancer of the prostate and chronic blastomycosis. Treatment with diethylstilbestrol was instituted for the carcinoma and it was noted later that in both cases the blastomycosis without "specific" treatment apparently had been eradicated. Two other patients with the systemic type of blastomycosis (without carcinoma) then were treated with stilbamidine, which is not a hormone but which is related chemically to diethylstilbestrol. These two patients also responded dramatically and apparently were cured. All four patients previously had failed to respond to orthodox treatment. The mode of action of the drug is not known, although in vitro studies indicate the effects to be chemotherapeutic and not hormonal. There also was a case of actinomycosis which was treated successfully with stilbamidine. What effect this group of drugs would have upon other fungal

infections was not known by the close of 1952, although preliminary studies indicated that the spectrum of effectiveness probably would be narrow.

It appeared that ringworm of the scalp might occur in adults more often than was generally realized. This had always been considered a disease of childhood which was cured spontaneously with the onset of puberty. However, about 70 cases of ringworm of the scalp in adults or postpubertal persons were reported from Texas alone. The infections produced a variety of bizarre clinical pictures which often mimicked other inflammatory diseases of the scalp so that the diagnosis could be determined only by recovering the organisms from infected scalps and by culture studies. Examination with Wood's light was unreliable as a diagnostic procedure in the cases observed in Texas. (See also MEDICINE.) (H. RA.)

Detroit. Detroit, Mich., fifth United States city in population according to the 1950 federal census, when the count was 1,849,568, had an estimated 1952 population of 1,915,000 and an area of 137.9 sq.mi. The 1952 population of the metropolitan area, embracing the city and adjacent suburbs, was estimated at 3,250,000.

Founded in 1701 as a French post, Detroit stands on the Detroit river, part of the international border waterway linking Lakes Huron and Erie. Windsor, Ont., is directly opposite Detroit, to the south.

Hub of southeastern Michigan's manufacturing complex, Detroit and its close environs had a 1952 industrial output estimated at \$10,000,000,000. As an international port, Detroit in May attained a place second only to New York city in dollar value of exports and imports. That month's total was \$144,400,000. In October customs receipts reached an all-time monthly high of \$5,725,683. While largely attributable to transborder rail and truck shipping, a considerable part of the gain came from growth of Detroit's direct ocean traffic.

Inadequately equipped as to general cargo-handling facilities, Detroit nevertheless attracts many seagoing vessels of tonnage small enough to permit navigation of the St. Lawrence river from the Atlantic ocean to the Great Lakes. As the lakes navigation season drew to a close, Detroit had seen more than 130 arrivals and departures of foreign flag vessels.

The year saw extensive progress in the construction of a system of depressed vehicular expressways, the letting of contracts for a city-county skyscraper to replace antiquated public buildings, major public housing developments and preliminaries toward creation of a third principal airport for the area.

The outstanding civic accomplishment of 1952 was the raising of \$12,453,000 (\$553,000 more than the minimum sought) by the United foundation, whose funds support about 150 welfare and service agencies, both local and national.

Business and residents continued to disperse from the city's central portions to outlying areas and suburbs, a characteristic often attributed to the size of the city combined with the absence of high-speed public transportation.

The city is served by the Detroit Street Railways, a municipally owned but not tax-supported system consisting wholly of surface vehicles. In October, for the first time in 21 months, it showed an operating profit. This revenue increase derived largely from a fare raise (15 cents to 20 cents) and heavy patronage because of high industrial employment.

The city government is nonpartisan, with a nine-man council elected at large. Detroit is the county seat of Wayne county, which elects under the party system and whose officials for the previous 20 years had been, with few exceptions, Democratic. (R. Ho.)

Evaluation: see EXCHANGE CONTROL AND EXCHANGE RATES.

Dewey, Thomas Edmund (1902—), U.S. governor, was born on March 24 in Owosso, Mich. He was graduated from the University of Michigan, Ann Arbor, in 1923, and received his law degree from Columbia university in 1925. He began to practise law and joined the New York Republican organization. In 1931 he was appointed chief assistant to the U.S. attorney for southern New York, and in 1935 special prosecutor to investigate gambling and other rackets in the state. He was elected district attorney in 1937, and campaigned for governor of New York in 1938 but was defeated. He was elected governor of New York in 1942 and re-elected in 1946 and 1950. In 1944 Dewey was nominated Republican candidate for president, but was defeated by Franklin D. Roosevelt. Again Republican candidate in 1948, he lost the election to Pres. Harry S. Truman.

Dewey generally supported the bipartisan foreign policy, and in Feb. 1951 he testified before the joint session of the senate foreign relations and armed services committees that he believed there should be no limit to the number of U.S. troops that could be sent overseas. As the 1952 presidential elections approached, Dewey said he would oppose any move to make him the Republican nominee again. Instead he backed the candidacy of Dwight D. Eisenhower, and during the Republican convention at Chicago in July, Dewey was one of the leaders credited with securing Eisenhower's nomination on the first ballot.

Diabetes. Convincing substantiation of the thesis that control of diabetes prevents, lessens and defers complications multiplied during 1952, from various sources and in many ways. One of these was the growing number of diabetics who after 20 to 25 years of the disease had given birth to healthy children. Although pregnancy is usually inadvisable for women with a duration of 25 years, the fact that such pregnancies could end successfully in those who had controlled their diabetes well was notable.

The word "cure" entered upon the diabetic horizon when it was found that hyperglycaemia could be counteracted in an experimental animal by a low diet, by insulin or by phlorhizin. Treatment of the disease within the first three months, but not later, resulted in the restoration, recovery and regeneration of the islands of Langerhans of these animals. This had been known for several years but was more recently applied with some success by R. F. Ogilvie to the persistent alloxan diabetes of rabbits. The improvement consisted in the replacement of a marked hyperglycaemia and glycosuria by an almost or completely normal blood sugar and urine reaction, which, however, was of temporary duration. Such animals treated with anterior pituitary extract experienced enlargement and budding and a suggestive growth of new islands from the ducts. The mechanism of this action was obscure, but it was thought it might take place through stimulation of the thyroid gland and ovaries. Various estrogens were known to be effective in hastening or retarding the development of diabetes in Folgia's 95%-depancreatized rats, as reported by B. A. Houssay in 1951.

A knowledge of the insulin content of the blood in diabetes obviously would be of great value. Determinations had been attempted, but without marked success, because of the small content of insulin present. However, J. Bornstein and his collaborators, in Australia and England, devised a new technique for the analysis. They used for this work, as sensitive test animals, alloxan-diabetic, hypophysectomized, adrenalectomized rats. From results already obtained with known amounts of injected crystalline insulin, Bornstein reached the conclusion that the method was sufficiently sensitive to determine from $\frac{1}{20.000}$ to $\frac{1}{2.000}$ unit. From studies on humans, Bornstein and R. D. Lawrence attempted to differentiate two types of diabetes; namely,

those with and without available plasma insulin. Those in the first group were characterized by hyperglycaemia, together with ketosis and weight loss, and in the second group were those often controlled without insulin after weight is reduced. This work opened up possibilities for research into the nature and aetiology of diabetes.

Another diabetic mystery apparently was solved by the discovery that cobalt destroys the alpha cells of the islands of Langerhans in a fashion similar to that in which alloxan destroys the beta cells. It had formerly seemed strange that, when the pancreas was removed after the beta cells were destroyed with alloxan, less rather than more insulin was needed to control the experimental animal. It had been suspected that the alpha cells might exert a diabetic, anti-insulin effect, and that they were responsible for the temporary rise in blood sugar when certain types of insulin were injected. C. A. Vuylsteke, Cornelis and C. de Duve attacked the problem and reported that the daily subcutaneous injection of 30 mg. of cobalt chloride to male guinea pigs produced after six days not only histological lesions of the alpha cells of the pancreatic islands but also a significant decrease in the content of the hyperglycaemic factor. A detailed discussion of their work was presented by De Duve in the Banting lecture at the Diabetic association in England and at the first International Diabetes congress in Leyden, Neth.

The term "triopathy" was applied to a growing number of diabetic patients who had shown evidences first of involvement of the nervous system, then of retinitis and finally of nephropathy or diabetic glomerulosclerosis. In a group of 70 such patients more than one-half were patients whose diabetes began under the age of 20 years; about one-third had diabetes which began between the 20th and 40th year; in the remainder, diabetes began shortly after the 40th year of age. Among the latter, diabetes was characteristically of the more severe type found in younger patients. The neuropathy consisted chiefly of the development of acute, painful neuritis involving the legs, but in some cases also caused the typical diabetic diarrhoea and in a few patients the typical pseudo-Charcot joints. The nervous involvement usually did not occur until diabetes had been present for from 5 to 15 years, but occasionally it was found at nearly the same time with the retinitis. The retinal lesions consisted of the retinal haemorrhages and exudates seen in diabetes, but usually advanced to severe retinitis proliferans. At the same time or soon thereafter were discovered albuminuria, oedema and hypertension of diabetic glomerulosclerosis. Death from uraemia resulting from renal failure occurred in nearly one-half these patients. Autopsies in a few cases showed the typical diabetic nephropathy characterized by the presence of the Kimmelstiel-Wilson lesions in the glomeruli, intensive arteriolar sclerosis, various degrees of chronic pyelonephritis and extensive atherosclerosis.

Shields Warren and Philip M. LeCompte propounded the theory that most of the pathologic lesions in diabetes may have a common denominator in a disturbance of polysaccharide metabolism.

Diamonds. An increased output of 10% in 1951 brought the total to another new record high. Outputs are shown in Table I, as reported by the U.S. bureau of mines, the 1951 data being broken down to show the proportion of the total (83%) that was industrial stones.

SORTING newly mined diamonds at a jungle clearing in French Equatorial Africa in 1952 before shipping to the U.S. stock pile

Table II.—U.S. Diamond Imports

	(Carats)			
	Rough	Cut	Industrial	Total
1946	1,044,517	604,638	4,705,118	6,354,222
1947	996,514	347,810	4,112,189	5,456,513
1948	909,871	388,499	10,648,250	11,946,620
1949	633,731	335,487	6,381,476	7,350,694
1950	673,699	492,741	11,201,045	12,367,485
1951	697,981	480,516	12,225,380	13,403,877

Total sales by the sales syndicate also made another record high, at £65,057,965, of which £46,780,632 was gem stones and £18,277,333 was industrial stones.

The stock of industrial stones, accumulated in the earlier years when industrial consumption was low, had been exhausted, and future industry demands would be met by current production.

United States Imports.—The dollar value of diamond imports in 1951 was the highest on record, with the exception of 1946.

The total value of imports rose from \$139,362,975 in 1950 to \$157,302,813 in 1951, compared with \$181,127,581 in 1946.

Dirksen, Everett McKinley (1896–), U.S. senator, was born on Jan. 4 at Pekin, Ill. He studied at the University of Minnesota, Minneapolis, from 1913 to 1917 and served with the United States expeditionary forces during World War I. In 1932 he was elected to the U.S. house of representatives on the Republican ticket, and he served in the 73rd–80th congresses (1933–49). Although he attracted attention in congress for his heated criticism of the New Deal, he generally supported Pres. Franklin D. Roosevelt's foreign policy after Sept. 1941. In 1950 he was elected to the U.S. senate. On Jan. 12, 1951, Dirksen was appointed chairman of the senate Republican campaign committee. In the senate he frequently criticized U.S. involvement in the support or defense of foreign countries. In 1951 he voted against universal military training and service, against sending additional U.S. divisions to Europe and in favour of reducing foreign economic aid funds by \$500,000,000. In 1952 he opposed ratification of the Japanese peace treaty without modification, and also voted against the Bonn peace pact with western Germany and the North Atlantic treaty protocol which extended mutual defense agreements to the new European Defense Community (France, west Germany, Italy and the Benelux nations). Dirksen was a prominent supporter of Sen. Robert A. Taft's candidacy for the Republican presidential nomination in 1952 and made the nominating speech for Taft at the Republican convention, July 10.

Disabled American Veterans: see VETERANS' ORGANIZATIONS.

Disasters. During 1952 loss of life and property in disasters included the following:

Evacuation

- Jan. 10 Near Bangor, Wales. Irish air liner hit Moel (mountain) Siabod; 23 persons were killed.
- Jan. 19 Near Sandspit airport, British Columbia. Airlift plane with U.S. veterans returning from Japan and Korea fell into Pacific ocean; 36 were killed and 7 rescued. Search plane sent out the same day crashed into Tyler peak, Washington, killing three of eight air force men aboard.

APARTMENT HOUSE IN FLAMES at Elizabeth, N.J., Feb. 11, 1952, after a north-bound plane crashed into it taking a toll of more than 30 lives. It was the third crash in eight weeks involving planes arriving or departing from the nearby Newark airport

- Jan. 22 Elizabeth, N.J. Twenty-nine persons, including former U.S. secretary of war, Robert P. Patterson, were killed and 1 died later when air liner hit apartment homes while trying to land at Newark, N.J., airport; 7 of dead were residents of apartments hit.
- Feb. 4 Near Kikwit, Belgian Congo. Belgian air liner crash killed 15.
- Feb. 7 Near Yokota airport, Japan. Superfort crash killed 13 of U.S. crew and 3 or more Japanese passengers.
- Feb. 11 Elizabeth, N.J. Air liner taking off from Newark, N.J., airport crashed into apartment building, fatally injuring 33. This air disaster, the third in Elizabeth within two months, resulted in the closing of Newark airport.
- Feb. 16 Near Burgio, Sicily. British air liner hit mountain; 34 bodies were found, but only 31 passengers were listed on air line records.
- March 3 Nice, Fr. French air liner crashed after engine failure; 37 persons were killed, including U.S. ballet dancer Harriet Toby.
- March 12 Near New Braunfels, Tex. Two B-29 bombers collided in midair; 15 air force crewmen died.
- March 22 Near Frankfurt, Ger. Dutch air liner crashed in an attempted landing; 45 of 47 on board were killed.
- March 26 Moscow, U.S.S.R. According to unverified report, about 70 were killed when Russian air liner collided with air force plane over Tula airport.
- April 4 Near Mobile, Ala. Midair collision of two U.S. air force planes killed 15.
- April 5 Jamaica, L.I., N.Y. Cargo plane crashed into street, killing two crewmen and three persons on ground.
- April 9 Oshima Island, Japan. First accident since resumption of Japanese civilian air flights in Dec. 1951 claimed 37 victims when air liner crashed into Mihara volcano.
- April 11 San Juan, P.R. U.S. air liner fell into the harbour after take-off; 52 were killed. Seventeen survived, including the pilot, Capt. John C. Burn, husband of Jane Froman, singer.
- April 15 Spokane, Wash. B-36 bomber take-off crash killed 15; 2 lived.
- April 18 Near Los Angeles, Calif. Crash of nonscheduled air liner killed 29.

- April 29 Brazil. Air liner bound for New York city crashed in jungle; 50 persons died.
- May 28 Ft. Worth, Tex. Crash of B-36 bomber at Carswell air force base killed seven U.S. air force men and injured ten.
- June 5 Off Den Helder, Neth. Dutch jet fighter plane crashed into British minesweeper during NATO naval manoeuvres; pilot and 14 aboard ship were killed.
- June 24 Near Lakenheath, Eng. Crash of U.S. bomber killed 11 crewmen.
- July 11 Off Salvador, Braz. Brazilian air liner crashed into Atlantic; 5 persons died, 13 were missing.
- July 22 Marianna, Fla. Jet bomber exploded; four crewmen died and two children were killed in home by falling debris.
- July 22 Near Topeka, Kan. Crash of B-29 bomber killed all eight of crew.
- July 23 Kyushu Island, Japan. U.S. army transport crash killed five of crew and two women on ground.
- Aug. 12 Near Goiânia, Braz. Crash of Brazilian air liner killed 24.
- Aug. 25 Off western Sicily. British chartered air liner fell into Mediterranean; 7 persons were dead or missing; 50 were rescued by Italian fishermen.
- Aug. 25 Shreveport, La. Air force bomber crashed at Barksdale air force base, killing seven of eight-man crew.
- Aug. 26 Off Panama City, Fla. Fighter pilot mistakenly fired at air force bomber instead of a drone target plane during firing practice; bomber crashed into Gulf of Mexico with six of crew of eight reported lost.
- Sept. 6 Farnborough, Eng. R.A.F. jet fighter exploded over crowd at air show, killing 27 spectators and pilot John Derry and observer.
- Sept. 24 Saigon, Indochina. Crash of U.S. navy plane killed 13 French sailors aboard.
- Oct. 8 Near Portland, Ore. U.S. air force plane crash killed 11.
- Oct. 26 Luzon Island, Philippines. U.S. air force weather plane with 15 aboard disappeared in typhoon.

Fires and Explosions

- Jan. 7 Atlantic City, N.J. Fire on boardwalk caused damage estimated at \$4,000,000.
- Jan. 14 Stellarton, N.S. Coal mine blast killed 19.
- Feb. 2 Near Greensburg, Pa. Six were killed in coal mine explosion.
- April 19 Near Zwickau, Ger. (Soviet zone). Explosion in coal mine killed 47.
- May 23 Tahlequah, Okla. Fire caused by lightning killed nine children and one adult.
- Aug. 31 Salamis, Gr. Explosion at Greek naval base killed 14 and injured 40 or more.
- Sept. 5 Welkom, U. of S. Af. Truck loaded with dynamite exploded, killing 12.
- Oct. 31 Hillsboro, Mo. Fire in nursing home killed at least 18 persons; about 20 were injured.

Marine

- Jan. 9 North Pacific ocean. U.S. freighter "Pennsylvania" was abandoned by crew of 45 about 465 mi. northwest of Vancouver Island, Canada. There was no trace of ship or crew.
- Jan. 10 Off Lizard Point, England. U.S. freighter "Flying Enterprise" sank within 50 mi. of the southwest tip of England, after heroic 12-day effort of her captain, Henrik Kurt Carlsen, to save ship. Carlsen had ordered ship abandoned on

- Dec. 29, 1951, and remained on board alive until he was joined by a British seaman, Kenneth Dancy, a week later.
- Feb. 18 Off Cape Cod, Mass. U.S. tankers "Pendleton" and "Fort Mercer" broke apart in storm; crewmen were drowned.
- March 8-9 North sea. Storms claimed lives of more than 50 seamen.
- April 21 Off northeast Korea. Explosion of ammunition on U.S. cruiser "St. Paul" killed 30 seamen; ship was shelling North Korean coast at the time.
- April 26 Atlantic ocean. U.S. aircraft carrier "Was" collided with minesweeper "Hobson" during night manoeuvres; "Hobson" sank with loss of 176 men, including captain; 61 were rescued. "Wasp."
- May 25 Near Wilmington, Del. Collision of two tankers "Dodge" and "Michael," in Delaware river killed ten seamen.
- Sept. 3 Near Lucknow, India. About 80 were reported dead after overloaded boat capsized in Gangetic river.
- Sept. 9 Belgrade, Yugos. Ferryboat on Danube capsized; 86 persons were drowned.
- Sept. 24 Off Toulon, Fr. French submarine "La Sibylle" failed to surface after anti-submarine manoeuvres in Mediterranean; crew of 48 was lost.
- Oct. 22 Off Puerto Quintero, Chile. Chilean naval transport boat "Brito" exploded after running aground; 21 of crew died.

Miscellaneous

- March 6 Baltimore, Md. Temporary stands at SoHo Henie ice show collapsed, injuring approximately 275 persons.
- April 6 Caracas, Venez. Panic in church following false fire alarm killed 53.
- May 10 Belle Ville, Arg. Wall of sports arena collapsed; more than 25 were killed, 100 injured.

Natural

- Jan. 3 Eastern Turkey. Sixty-two persons were killed and 250 injured in an earthquake.
- Jan. 12-19 California and Nevada. Snowstorms and floods killed more than 20. Southern Pacific train was more than 200 aboard was snowbound Donner pass, Sierra Nevada, for three days.
- Jan. 22-23 Minnesota, North Dakota, South Dakota. More than 20 persons died in blizzards.
- Feb. 18-19 New England. Almost 50 died in snowstorms.
- March 4 Hokkaido Island, Japan. Earthquake followed by tidal waves killed approximately 30 and injured almost 200.
- March 21-22 Southern U.S.A. Tornadoes killed almost 100 and injured an estimated 2,500 in Missouri, Arkansas, Tennessee, Kentucky, Mississippi, Alabama. More than 45 were killed in Judson, Ark., which was almost completely razed by tornado.
- April 3-30 Missouri-Mississippi valleys, U.S. Flooding of Missouri and Mississippi rivers and tributaries caused damage estimated at more than \$3,000,000 in ten states.
- July 2-3 Philippine Islands. About 85 persons were reported dead and more than 100 missing in typhoons; 10,000 were left homeless.
- July 6-12 Western Japan. Eighty-four persons were reported killed, 92 missing and 94 injured as a result of rainstorms and landslides.
- July 21 California. Earthquake with epicentre near Tehachapi, Calif., killed 12 and injured several hundred.

- ig. 16 Lynmouth, Eng. Flash flood killed about 20 persons; another 20 were missing.
- ig. 22 Bakersfield, Calif. Earthquake killed two and caused damage estimated at \$20,000,000.
- ig.-Sept. Southeastern Mexico. Month-long floods left more than 100 dead and caused \$25,000,000 damage.
- pt. 6 Near Chamba, Himachal Pradesh state, India. Postmonsoon storm in the Himalaya mountains was reported to have taken the lives of 350 religious pilgrims.
- pt. 21 Tebessa, Alg. Flash flood caused about 25 deaths.
- t. 15 Tabasco state, Mex. More than 40 persons were reported dead in floods, which also destroyed \$35,000,000 worth of crops.
- t. 20-22 Indochina. Typhoons and tidal wave killed more than 500 along Indochinese coast; about 350 of casualties were in Panthiet port.
- t. 21-22 Philippine Islands. Typhoon struck central Philippines, killing more than 400; more than 350 were missing.
- t. 22 Southern Turkey. Earthquake which shook region around Adana killed at least 18.
- ilway
arch 4 Near Rio de Janeiro, Braz. Collision of two trains 20 mi. from Brazilian capital was reported to have killed about 120 persons.
- ay 17 Near Adana, Turk. Train jumped tracks, killing 26.
- ay 18 Near Bikaner, India. Train wreck killed 45, injured 35.
- ay 28 Madrid, Sp. Trolley plunged into river, killing about 30 and injuring 50.
- ly 9 Near Rzepin, Pol. Unconfirmed report said that about 160 Soviet troops, including a general, were killed when train plunged down an embankment into a lake.
- t. 8 Harrow-Wealdstone, Eng. Two express passenger trains crashed into commuter train; 112 were killed or died later.
- t. 20 Near Ladysmith, U. of S. Af. Train derailment killed 25.
- fficc
n. 1 United States. About 350 persons were killed in traffic accidents during four-day period ending New Year's day.
- n. 26 Near Puebla, Mex. Bus crash into ravine killed 49.
- ril 8 Near Catemaco, Mex. Truck carrying holy week pilgrims plunged into ravine, killing 40 or more.
- ay 25 Near Chonomas, Mex. More than 25 persons were killed when a truck turned over.
- ly 4-6 United States. A total of 366 persons died in traffic accidents over Independence day week end.
- ig. 4 Near Waco, Tex. Two passenger buses crashed head-on, killing 28. This was highest death toll of any bus accident in U.S. history.
- pt. 2 Near Chiclayo, Peru. Truck fell into ravine; more than 20 persons were killed.

were: local expense \$38,987,800, and missions and benevolence \$12,362,216, a total of \$51,350,016.

The 1952 annual assembly of the International Convention of Disciples of Christ was held in Chicago, Ill., May 19-23, with a registered attendance of 4,885. Howard Thomas Wood of Memphis, Tenn., was elected president. Mrs. Charles F. Bailey, Ballinger, Tex., John Paul Pack, Seattle, Wash., and W. B. Pearce, Shreveport, La., were elected vice-presidents. Gaines M. Cook, executive secretary, was re-elected for a six-year term. The American Baptist convention was held simultaneously in the same city. Three joint sessions, highlighting common beliefs, concerns and fellowship, were held, and a united communion service was attended by 11,000 worshippers from both groups.

The Disciples of Christ were in 1952 members of the World Council of Churches, the National Council of Churches of Christ in the U.S.A. and the American Conference on Church Union. They were also members of the World Convention of Churches of Christ, meeting at intervals of five years. The 1952 session was held at Melbourne, Austr., Aug. 5-10.

Missionary work during the year was conducted in ten foreign fields as follows: Africa, Argentina, India, Jamaica, Japan, Mexico, Paraguay, Philippines, Puerto Rico and Thailand, with 213 missionaries and 2,319 national leaders. The United Christian Missionary society, a board of missions and education located in Indianapolis, Ind., is the major administrative office for missions, Christian education and church development.

The pension fund of Disciples of Christ reported a total active membership of 4,313, with assets of \$13,513,910.

National headquarters are located at 516 K. of P. building, Indianapolis, Ind.; Gaines M. Cook was executive secretary during 1952; Gertrude Dimke, recording secretary; Robert L. Lewis, assistant secretary. (See also CHURCH MEMBERSHIP.) (G. M. Ck.)

Dominican Republic. The Dominican Republic occupies 19,129 sq.mi., about two-thirds of the total area of the island of Hispaniola. Pop. (census Aug. 6, 1950) 2,121,000, (1951 est.) 2,167,000; that of the capital, Ciudad Trujillo (known from the beginning of the 16th until the second quarter of the 19th century as Santo Domingo, whence the name of the nation), 181,000 (with about 250,000 in the metropolitan area); and that of the principal provincial cities, Santiago de los Caballeros, 56,000; San Pedro de Macoris, 20,000; San Francisco de Macoris, 16,000; San Felipe de Puerto Plata, 14,000; Barahona, 14,000; and La Romana, 11,500. Presidents in 1952: until Aug. 16, Rafael Leónidas Trujillo y Molina; after that date, Héctor B. Trujillo y Molina.

History.—More than two decades of uninterrupted rule by Gen. Rafael Leónidas Trujillo, either as president or commander of the armed forces, ended in 1952 with the election of his younger brother, Gen. Héctor B. Trujillo, as president on May 16, for the five-year term commencing Aug. 16. The new president had served many years as minister of war, navy and aviation.

Agricultural prosperity continued unabated. Again, large sugar and coffee crops were sold in Europe; and Dominican-European trade continued to grow more rapidly than that between the Dominican Republic and the United States. Foreign investment in commerce and industry continued to grow. The number of ships

Disciples of Christ. The world membership of this movement for Christian unity in 1952 was 945,607; the total membership in the United States and Canada was 1,802,157. The total number of churches in the world was 8,739, and in the U.S. and Canada, 7,915. Illinois churches reported the largest number of baptisms with a total of 4,928 for the year; Indiana churches, 4,768 baptisms; Texas churches, 3,593 baptisms. Cash receipts reported for the U.S. and Canada

and of aircraft calling at Dominican ports of entry showed a small increase, as did the volume of tourist expenditure. Public works programs were advanced at a reasonable rate. Price levels showed a tendency to rise, but wage levels changed only slightly. No significant increase in unemployment was noted. The management of the public finances continued to follow the pattern of previous years—the avoidance of new indebtedness, the accumulation of cash reserves and a moderate tax policy.

The foreign relations of the Dominican Republic in 1952 were marked by no unpleasantness with neighbour states. The fall of Carlos Prío Socarrás in Cuba, in March, terminated years of tension that had begun in 1944. The return to power in Cuba of Gen. Fulgencio Batista was expected to assure accommodation in Caribbean affairs. Relations with Haiti continued cordial.

(C. E. Mc.)

Education.—In June 1951 there were 2,749 schools (including 1,208 emergency schools), all of which were maintained by the state except 107 semiofficial (state-aided) and 95 private schools. The total number of pupils was 262,499. The University of Santo Domingo had 2,254 students and 172 faculty members. The 1951 budget allocated \$4,629,398 for education. The 74 motion-picture theatres had a seating capacity of 30,963.

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The 1952 budget provided for revenue of \$82,796,500 and expenditure of \$82,749,503. The internal debt amounted to \$22,987,361 on Dec. 31, 1951; there was no external debt. Notes in circulation on Aug. 31, 1952, totalled \$26,940,000; gold reserves \$12,100,000; checking accounts in commercial banks \$36,500,000; government deposits \$23,090,000; time deposits \$13,900,000. The cost of living index at Ciudad Trujillo stood at 110 in Sept. 1952 (1948=100).

Trade and Communications.—Exports in 1951 were valued at \$108,454,681; imports were \$51,200,000. Leading exports were sugar (47%), coffee (16%), cacao (15%), tobacco (5%) and chocolate (4%). Leading customers were the United Kingdom (46%), the U.S. (43%) and the Netherlands and possessions (3%). The U.S. was by far the leading supplier; others were the Netherlands Antilles, the United Kingdom, Germany and Japan.

There were 170 mi. of public railway, all owned and operated by the government, and about 650 mi. of industrial railway, operated mainly by the sugar companies. In 1949 the mileage of surfaced highway was about 500; that of all roads was about 3,000. Motor vehicles in 1948 included 3,124 automobiles and 2,390 trucks. A television station began operation in 1951.

Agriculture.—In the 1951-52 season, a record total of 658,000 short tons of sugar and 26,559,000 gal. of blackstrap molasses (preliminary figures) was produced; in 1951, 531,713 tons of sugar were exported, almost entirely to the United Kingdom. Other important crops in 1951-52 were coffee (400,000 bags of 132 lb. each); cacao (30,000 short tons); rice (66,000 tons); tobacco (1951, 22,550 tons). The livestock census of 1950 (preliminary figures) showed 887,000 cattle and 1,140,000 pigs.

Manufactures.—In 1950 there were 3,412 industrial establishments with capital of \$119,636,855 (of which the sugar industry accounted for more than two-thirds), 44,484 employees and gross output valued at \$120,471,745. Important manufacturing enterprises in 1952 included 16 sugar mills, a large chocolate plant, an industrial alcohol plant, 2 cotton textile mills, 2 breweries and a cement plant.

(J. W. Mw.)

Donaldson, Jesse M. (1885-), U.S. postmaster general, was born on Aug. 17 near Shelbyville, Ill., and attended school at Oconee, Ill., and at Shelbyville. He began teaching school in the vicinity, and eventually left his teaching position to accept a post as letter carrier in 1908. He held in succeeding years various positions of increasing importance in the postal service, becoming, by 1945, first assistant postmaster general. He became postmaster general in 1947, the first post-office career man to attain this position.

Under his administration in 1951 an investigation was launched into the "sale" of postal jobs in Mississippi, as a result of which the post office dismissed or filed charges against 56 employees. In October congress passed legislation to raise postal rates by about \$117,000,000 a year and to institute postal pay increases amounting to about \$250,000,000 a year. In July 1952 Donaldson urged that second- and third-class mail rates be increased to offset a post-office deficit estimated at more than \$600,000,000 for the fiscal year 1953.

Donations and Bequests. New factors bearing on philanthropy raised the prospect that the total dollar volume of giving would be increased

A RED FEATHER SERVICE at work in Chicago, Ill., where child-care institutions, foster homes and day nurseries for more than 7,500 youngsters depend on local community support in 1952

during 1952. However, because of increased costs, there was little indication that philanthropic agencies in general would finish the year without some financial stress.

Congressional action increasing the rate of allowable personal income tax deduction for contributions from 15% to 20% was expected to raise materially the level of individual giving.

Corporate giving was apparently on a greater scale than ever before. Organized efforts to obtain corporation gifts were rewarded by a greatly increased willingness on the part of corporations to give to projects which would benefit their businesses or their employees.

Preliminary indexes of current giving indicated that the total of philanthropy might continue upward, with a possible total of \$4,300,000,000 in 1952 compared with the estimated total of \$4,250,000,000 in 1951. This prospect was borne out by the study, made annually by the John Price Jones Company, Inc., of announced gifts in ten major cities, which showed total gifts of \$262,138,442 in those cities for the first eight months of 1952, compared with \$229,197,640 in the same months in 1951.

Another index was found in the reports of gifts to 51 leading institutions of higher education. These colleges and universities reported total contributions in 1950-51 of \$88,235,000, an increase of 14.35% over the previous year.

Community chest goals offer another test of the prevailing estimate of the extent of philanthropy. Five hundred and one community chests, which were raising their 1953 budgets in 1952, announced aggregate goals of \$217,759,139. These same chests had aggregate goals of \$203,416,552 a year earlier.

The movement for closer organization of appeals, through federation, went forward during the year. In the welfare field numerous national agencies federated their appeals with those of the community chests. In the educational field, there were more than a score of alliances of colleges in individual states created for the purpose of joint appeal to the business interests of the area.

Little change was evident in the distribution of gifts. Education and organized social work continued to receive a greater portion of reported philanthropy.

The year 1952 appeared to be one of fine response by the public to philanthropic appeals, but a year of real struggle for philanthropic agencies to make ends meet even with increased giving.

(J. P. J.)

Great Britain.—Among big public appeals opened during 1952 the most important was the King George VI National Memorial fund, launched by the lord mayor of London and the prime minister on Oct. 4. In a broadcast appeal Winston Churchill said the memorial would take the form of a statue and of a scheme to benefit both young and old. Within four days more than £100,000 had been received.

On June 19 the Anglican Church assembly launched an appeal for £4,000,000 for the preservation of historic churches. Response to the national appeal for the Lynmouth flood relief fund in August far exceeded the £250,000 expected; when the appeal closed in October, more than £1,000,000 had been received.

On June 6 an appeal was made for £120,000 for a Braille centenary fund to expand the production of books for the blind. On June 20 a cheque for more than £150,000 was presented to Cambridge university, the proceeds of the Field Marshal Jan Christiaan Smuts memorial appeal for the endowment of commonwealth studies.

In March Ernest E. Cook, of Bath, formed a trust to devote the incomes of seven of his estates to educational purposes, and also gave the National trust the largest sum it had ever received.

Grants to British institutions from the Rockefeller foundation totalled nearly £90,000; grants were also made to 12 other European countries. It was announced in the seventh report of the Nuffield foundation that more than £1,500,000 had been allocated during the preceding three years. (See also COMMUNITY CHEST; SOCIETIES AND ASSOCIATIONS, U.S.)

Donnelly, Walter Joseph (1896—), U.S. diplomat, was born on Jan. 9 at New Haven, Conn. After service in the U.S. army in 1917–18, he studied at Georgetown and George Washington universities in Washington, D.C., and at the University of Caracas in Venezuela. His first government position was as a commercial agent with the U.S. department of commerce (1923), and he later served as trade commissioner or commercial attaché in a number of foreign posts from 1924 to 1945. In the latter year he was named counsellor of the U.S. embassy in Panamá, and in 1947 ambassador to Costa Rica and (later the same year) Venezuela.

On Aug. 24, 1950, Donnelly was named U.S. minister to and high commissioner for Austria and was advanced to the rank of ambassador to that nation on Jan. 10, 1952. On July 18, 1952, he was appointed U.S. high commissioner for Germany to succeed John J. McCloy, effective Aug. 1.

Douglas, Paul Howard (1892—), U.S. economist and senator, was born on March 26 in Salem, Mass., and spent his boyhood on a farm in Maine. In 1913 he graduated from Bowdoin college, Brunswick, Me. After doing graduate work at Columbia and Harvard universities, he began teaching at the University of Illinois, Urbana. He was a labour disputes arbitrator for the Emergency Fleet corporation in 1918 and 1919, and in the latter year he returned to teaching, first at the University of Washington, Seattle, and later at The University of Chicago. He wrote books on economic theory and served on a number of boards and commissions dealing with such subjects as unemployment, utility rates, old-age pensions and labour-management relations.

Douglas was an alderman of the city of Chicago from 1939 until 1942, when he enlisted as a private in the U.S. marine

corps. He was wounded and spent 14 months in hospitals, leaving the service as a lieutenant colonel. In 1948 he was elected U.S. senator from Illinois.

In 1951 Douglas was chairman of a senate labour subcommittee investigating ethics in government which helped uncover irregularities in federal offices. Douglas opposed Pres. Harry S. Truman's nominations for two federal judgeships in Illinois, and on Oct. 9, 1951, the senate supported Douglas by rejecting the president's appointments. Douglas applauded President Truman's announcement of March 29, 1952, that he was withdrawing from the presidential race and shortly thereafter endorsed Sen. Estes Kefauver as the Democratic candidate. Douglas acted as a chief strategist for Kefauver during the latter's unsuccessful bid for nomination at the Chicago Democratic convention in July.

Drew, George Alexander (1894—), Canadian political leader, was born on May 7 at Guelph, Ont., and educated at Guelph Collegiate institute, Upper Canada college and the University of Toronto. He became leader of the Ontario Conservative party in 1938, member of the Ontario legislature in 1939 and premier of Ontario and minister of education in 1943. On Oct. 2, 1948, he was chosen leader of the national Progressive Conservative party, and was elected to parliament on Dec. 20 of that year. In the 1949 general election he retained his seat in Carleton. As leader of the opposition in parliament, he was the government's chief critic, and sought stricter parliamentary control of government costs, increased efficiency in government services, substantial reduction of nondefense expenditures, reform of parliamentary procedure, a general broadening of social security legislation on a contributory basis, the appointment of a royal commission to advise upon the reorganization of the civil service and the creation of a parliamentary committee to examine all defense expenditures. He took the stand that Canada was bound to honour its commitments to the United Nations.

During 1952 Drew proposed emergency price controls, urged increased industrial production and demanded speeded-up housing construction; he visited the United Kingdom and urged more industrial co-operation between the two countries. Upon the eve of the autumn session of parliament he toured western Canada. (C. Cy.)

Drought: see METEOROLOGY.

Drug Administration, U.S. The Federal Security agency's Food and Drug administration continued its campaign against illegal sales of prescription drugs in the fiscal year 1952. Such actions accounted for 80% of the criminal cases alleging drug violations. Barbiturates or amphetamines were usually involved, often combined with sales of sulfa drugs, penicillin, potent hormones or thyroid. The heaviest penalty imposed for illegal sales was a two-year prison sentence for a druggist convicted of supplying barbiturates to teen-agers. New prescription drug legislation, which went into effect in April 1952, clarified the responsibilities of those concerned and provided more directly for federal regulatory controls.

Late in June 1952, reports were received of serious blood disorders and a number of fatalities associated with the antibiotic drug chloramphenicol. Hundreds of medical case histories were collected and the Medical Sciences division of the National Research council was asked to evaluate them. On the recom-

mendation of these experts, the labelling of chloramphenicol was revised to caution physicians not to use it indiscriminately or for minor infections, and to make appropriate blood tests.

Manufacturers made 20 recalls of drug products during the year—13 voluntarily and 7 at the request of the Food and Drug administration. Nine were recalled because they were below the strength declared on their labels and three because they were mislabelled as other drugs. Eight involved other serious errors, such as a dangerous lack of potency, lack of sterility or contamination with a dangerous chemical.

The operation of treatment centres is outside of federal jurisdiction as long as activities remain localized. However, patients are often attracted from other states; when they return home, orders for misbranded medicines follow as original supplies are used up. Cancer and diabetes are prominent among the diseases treated, and patients may abandon or delay medical care while pinning their faith on untrained practitioners. The operator of one such "cancer clinic" was enjoined; one closed after a fine of \$2,000; a third was prosecuted for violating an injunction prohibiting interstate shipment of his "cure."

Therapeutic devices, such as X-ray machines, clinical thermometers, surgical dressings and hypodermic needles, are subject to the provisions of the federal Food, Drug, and Cosmetic act relating to devices. Besides such devices which require some supervision as to their sterility or safety, there are many contraptions marketed with false and misleading claims, some of them also dangerous to health because of their method of operation. Among devices seized were silver "cosmic ray" locket, sold for \$250 to \$750, according to size, which were promoted as cures for high or low blood pressure and for insanity; and a \$1,600 colonic irrigator sold to chiropractors with claims for treating all types of disease.

New-drug applications received during the fiscal year 1952 numbered 395, including 124 for veterinary use. Widespread interest followed the release of the new drug used in tuberculosis treatment, isonicotinic acid hydrazide. Other significant drugs permitted to be marketed were purified corticotropin preparations; two radioactive products; blood plasma extenders; an antagonist of certain narcotics; an antimalarial drug; hypotensive agents; aminopterin for acute leukemia therapy in children; and some new antiepileptic drugs.

During the fiscal year, 274 batches of drugs composed wholly or partly of insulin and 17,433 batches of antibiotics were certified after testing for purity, potency and stability. Also certified were 3,839 batches of coal-tar colours, representing 4,023,710 lb., for use in foods, drugs or cosmetics.

A total of 2,309 factory inspections and the examination of 6,692 samples of interstate shipments of drugs and devices resulted in 217 seizures and the institution of 108 criminal prosecutions and 4 injunctions in the federal courts. Examination of import shipments resulted in detention of 1,054 lots of drugs and devices failing to comply with U.S. requirements. (See also FEDERAL SECURITY AGENCY; NARCOTICS AND NARCOTIC TRAFFIC.)

Dulles, John Foster (1888–), U.S. attorney and international law expert, was born Feb. 25 in Washington, D.C., graduated from Princeton university, Princeton, N.J., in 1908 and was awarded a law degree at the George Washington university law school in 1911. As a specialist in international law he assisted the U.S. state department in Panamá, where he arranged for that republic's war declaration in 1917. In World War I he served as a major on the army general staff, and after that war went to the Paris peace conference as U.S. counsel on reparations and other financial matters. He drafted several of the treaty clauses. Between the two wars he became a prominent international lawyer. After a trip to Europe in 1937 he underwent, by his own account, a "spiritual change," and became convinced of the need for a Christian ethical basis to win a lasting peace. He was a member of the U.S. delegation to the 1945 conference to organize the United Nations at San Francisco, Calif., and was high in U.S. councils at many postwar international conferences.

In 1951, as U.S. ambassador-at-large, he travelled to both Asia and Europe to arrange for agreement among the World War II Allies, the U.S.S.R. excepted, to a peace treaty with Japan. For these measures he was repeatedly denounced by high soviet officials, but he won general support for the treaty terms, and it was signed in San Francisco on Sept. 8 by Japan and 48 non-Communist nations, with Dulles one of the members of the U.S. delegation.

Dulles resigned from his state department post on March 25, 1952. Both Robert A. Taft and Dwight D. Eisenhower declared their belief that Dulles could state Republican foreign policy to their mutual satisfaction, and he accordingly was chosen to prepare the Republican platform plank. This plank, adopted by the Republican convention on July 10, was generally conceded to be a skilful compromise on the question of extent of U.S. aid to foreign countries. After the November elections, President-elect Eisenhower named Dulles to the post of secretary of state in the coming administration.

Durkin, Martin P. (1894–), U.S. labour union official, was born in Chicago, Ill., on March 18. He attended school in Chicago and in 1911 began his apprenticeship as a steam fitter. He became a journeyman in 1917 and later that year entered the army, where he served for 22 mo. He was elected assistant business manager of the Steam fitters' Protective Association Local Union 597 (1921) and vice-president of the Chicago Building Trades council (1927), and was appointed Illinois director of labour (1933). He was dismissed from the latter post by Gov. Dwight Green in Sept. 1941 and then went to Washington, D.C., as secretary-treasurer of the United Association of Journeymen and Apprentices of the Plumbing and Pipe Fitting Industry of the United States and Canada. In 1943 he became general president of that American Federation of Labor union. He was also sixth vice-president of the A.F. of L. On Dec. 1, 1952, President-elect Dwight D. Eisenhower named him secretary of labour in the coming administration.

Dyestuffs. The recession in the domestic consumption of U.S. dyes evidenced during the final quarter of 1951 was carried along well into 1952. The activities of the first half of the year showed a decline of approximately 10% from the previous year's figures induced by a softening in consumer demand and the concomitant carrying of above average inventories. A definite improvement became evident in

August and, from all indications, the ground lost would be regained at the year's end. The consumption of U.S. dyes in the export market fell off sharply with little immediate hope for recovery, primarily because of the inability to compete with foreign producers on a cost basis and the uncertainty of dollar exchange. Prices of U.S. dyes remained stable with a few downward revisions. Defense requirements continued drawing heavily on several of the vat colours and their production paralleled the high level established in former years.

Problems pertaining to dyeing the newer synthetic fibres were still present. The industry was usually able to overcome these obstacles by providing colours and formulas designed to meet specific chemical and technical requirements. Research was concentrated upon the development of new colours with outstanding fastness and simplified working properties. Study of application techniques resulted in numerous improvements in processing methods and equipment design that were placed at the disposal of consuming industries.

Preliminary figures issued by the United States tariff commission showed that the production of all types of dyes in 1951 mounted to 185,681,000 lb., 5% less than the 1950 output of 195,713,000 lb. Sales of all dyes in 1951 totalled 158,872,000 lb. valued at \$174,405,000, compared with 188,382,000 lb. valued at \$190,786,000, a decrease of 16% in quantity and 8.6% in value. The unit value of all dyes sold rose to \$1.10 per pound compared with \$1.01 in 1950, the differences being primarily because of increased production of a number of higher priced dyes. As in preceding years, vat colours still maintained the lead position in both production and sales, accounting for 36.5% of the 1951 production and 35.9% of the poundage sold. Direct dyes represented 20%, sulphur dyes 11.5% and acid dyes 10%.

Four classes of dyes accounted for 82% of the total production of all dyes: azo dyes for 36%, anthraquinone vat for 22%, indigoid and thioindigoid for 13% and sulphur dyes for 11%. The anthraquinone vat colour group exceeded the 1950 production by 16%, indicating a continuing trend toward quality in colour, azo dyes fell off 9%, indigoid were down 26% and sulphur colours off 11%. Two low-priced dyes, indigo and sulphur black, were also 22% and 17% below the 1950 figures.

Sales of vat dyes, other than indigo, were valued at \$53,757,000, direct dyes \$37,221,000 and sulphur dyes \$6,713,000, the latter being exceeded in total value by the acetate, acid, azoic, basic and chrome dyes.

Dye imports in 1951 represented foreign invoice value of 6,300,000 compared with \$4,100,000 in 1950. Germany supplied 49%, Switzerland dropped to 44% and the United Kingdom supplied 7%. (A. G. BR.)

Other Countries.—The dyestuffs manufacturing industries of most countries in 1952 were affected by the recession in consuming trades, particularly textiles, and the decline in sales was aggravated by earlier events. Consumers had previously bought in excess of requirements, and when their own trades began to fall off they preferred to draw on their accumulated reserves rather than to buy further stocks of colour. Toward the end of 1952, however, the dyestuffs manufacturers began to share in the general improvement in trade. One interesting indication of changed circumstances was the decision of the British government in September to abolish most of the restrictions on the export of dyes imposed in 1948. Another factor influencing trade in dyestuffs was the increasing competition from western Germany. Exports of dyes from the German Federal Republic increased from 12,700 metric tons in 1950 to 20,300 metric tons in 1951 and from U.S. \$40,700,000 to \$69,600,000 in value.

Perhaps the most important event in the world dyestuffs industry in 1952 was the opening of a large-scale manufacturing plant in India. In March a factory was opened at Bulsar, mid-

way between Bombay and Ahmedabad, with the aim of producing enough of the country's most-used dyestuffs to meet the demands of textile, paper and other industries. The range of dyes would be enlarged as the need arose. It was estimated that at the outset the plant would save India \$500,000 in foreign exchange. Production at the start was to be 4,000,000 lb. of dyes a year. The nominal capital was equal to U.S. \$3,500,000.

An International Dyeing association, with headquarters in Paris, was founded in May. The inaugural meeting was attended by representatives of the industry from Austria, Belgium, France, western Germany, Italy, the Netherlands and Switzerland.

(L. E. MS.)

Ear, Nose and Throat, Diseases of.

During 1952 increasing attention was directed toward the effects of environmental and industrial noise on hearing acuity. Meyer S. Fox discussed the medical, economic and social aspects of industrial noise in 1952. The organ of hearing may be affected as the result of noise exposure in several ways: (1) by suffering loss of function; (2) by developing a state of abnormal sensitiveness; and (3) by acquiring special tolerance to the noise irritant.

It was learned that the factors which influence the degree of hearing loss are: (1) the intensity and loudness of the noise; (2) the frequency spectrum of the noise; (3) the period of exposure; (4) individual susceptibility to acoustic trauma; (5) age of the subject; (6) previous ear disease; (7) the character of the surroundings in which the noise was produced; (8) distance from source; (9) position of each ear with respect to sound waves.

Measures being taken for the control of industrial noise included: (1) surveys of noisy industrial areas; (2) pre-employment audiometric and otologic studies of employees; (3) audiometric studies of employees exposed to hazardous noise; (4) the establishment of quantitative standards for evaluating hearing loss; (5) the use of pre-employment selectivity tests to discover noise-susceptible persons; and (6) the development of procedures to reduce or eliminate noise, by redesigning machines and tools, by creating noiseless industrial processes, or by the use of earplugs and ear defenders.

Dizziness.—Dizziness is one of the commonest complaints presented to the physician. Various terms are used by patients to describe their dizziness, such as vertigo, faintness, unsteadiness, imbalance, rocking, staggering, blackout, drunkenness, swaying, insecurity, weakness, waviness, uncertainty, giddiness, light-headedness and the like. Since a variety of complaints, feelings and conditions are covered by the term "dizziness," Nicholas Torok developed the old question of what the patient actually means when he complains of dizziness.

Numerous classifications of the different types of vertigo had been formulated. It had been classified on a physiological or pathophysiological basis (spontaneous, reactive, experimental, vestibular); based upon the underlying pathology within the vestibular system (labyrinthine, peripheral, central); based upon the dominant psychic impression (sensory, tactile); in terms of the organ which was presumed to be the primary source (aural, cardiac, gastrointestinal); in accordance with general pathologic conditions where dizziness is a rather common accompanying symptom (arteriosclerotic, neurasthenic, hysteric); etc.

Dizziness is not merely a symptom but a varied multiplicity of sensations and impressions. Definitions and classifications are indispensable in the study of the phenomenon but are of little help in the understanding and, therefore, assistance of the patient. Torok believed that the concept concerning dizziness as a clinical complaint should be widened. In the final analysis, the dizzy sensation is a psychic phenomenon. The dizzy

reaction is under the influence of the whole personality, and variations of behaviour may be manifested accordingly. The most significant approach to the understanding of dizziness is through personal contact with the sufferer. The expressive power of the language on the subject is poor. The history is as important in the evaluation of the complaint as all the possible objective findings.

Obviously, treatment is based upon a correct diagnosis, with removal of the cause and alleviation of the symptom being the prime objectives. In some cases immediate symptomatic treatment is desirable to alleviate severe vertigo and associated symptoms. Other cases may require more vigorous medical or surgical approaches to achieve a cure.

Cancers of the Head and Neck.—Cancer of the head and neck comprises from 12% to 14% of all cancers of the body. If cancer of these areas is observed, identified and treated early, the outlook or prognosis compares favourably with that of any other malignant growth. According to Daniel S. Cuning and Fredrick M. Turnbull, early recognition and accurate diagnosis are of paramount importance. A complete examination calls for visualization of the nasal passages, mouth, cheeks, nasopharynx (back of the throat and nose) and larynx, aided by X-rays of the head and neck and biopsy (microscopic) study of any suspicious tissue for early positive diagnosis. The biopsy or tissue proof of a disease is the final procedure in diagnosis. A negative biopsy does not mean that the patient is free from carcinoma but that the specimen submitted to the pathologist did not show cancer. Several pieces, or in most cases the entire lesion with some normal tissue around it, should be sent to the pathologist.

The treatment of cancer, once limited to the use of surgery, X-rays and radium, was expanded in recent years. New anticancer drugs were developed, and hormones and radioactive isotopes were applied to the therapy of malignant disease. These new agents represented valuable additions to the therapeutic program, but the optimistic publicity that accompanied their use tended to obscure several facts. In the first place, most of these substances had a relatively narrow range of therapeutic activity. Moreover, while these agents might prolong life and make it more comfortable, they were for the most part palliative rather than curative. Permanent cures were still achieved largely with surgery or external irradiation or both, administered to patients with early lesions that had not yet metastasized widely.

The search for truly curative anticancer agents with broad ranges of therapeutic activity continued, but, until such agents were found, surgery and irradiation would remain the mainstays of therapy for most types of malignant lesions.

Cancer of the lip usually occurs on the lower lip and is seen from the fifth decade on, but may occur earlier. The biopsy and the removal of the entire lesion may be done at the same operation. A simple V excision through the whole lip about 1½ cm. away from the lesion usually suffices to cure early cancer of the lip, or irradiation may be effectively employed. If the submental glands are involved, a bilateral supraomohyoid neck dissection is indicated.

The buccal mucosa not only takes in the area over both cheeks, but includes all the mucous surface of the mouth. This means that the inspection for cancer of the buccal mucosa should include the cheek, the floor of the mouth, soft and hard palate, the buccal alveolar region and the gums. Recognition of oral leukoplakia and its importance is a paramount responsibility on the part of the dentist. Fulfilling of this obligation to the patient requires a basic familiarity with the nature of the lesion and all the aids to diagnosis previously discussed. Realization of the possible seriousness of outcome should be tact-

fully impressed upon the patient in order to secure maximum co-operation in the plan of treatment. Initial treatment of oral leukoplakia involves elimination of all possible local and general irritating factors. This should be followed by specifically indicated topical medication. Surgical or irradiation measures are called for if the affected area does not respond to medication or if clinical appearance and biopsy indicate the lesion is assuming malignant qualities.

Cancer of the tongue occurs mostly in men, but is seen occasionally in women. The treatment consists of adequate surgery occasionally including the mandible.

Cancer of the larynx also occurs most commonly in the male. Any case of a patient complaining of hoarseness should be investigated. A biopsy is obtained by special techniques of direct laryngoscopy. X-ray or removal of one cord in early lesions and the complete extirpation of the larynx when more advanced are recommended.

Lesions in the area of the nasopharynx, pharynx and hypopharynx may not be suspected until a developing mass appears in the neck. These types of tumours are best treated by X-rays or radium.

Cancer of the nasal sinuses is to be suspected when nasal blockage and recurring masses in the nose reveal malignant change. The treatment consists of complete removal of the upper jaw on the involved side, followed by irradiation. (See also HEARING.)

Economics. While certain sectors of the western world were beset with serious economic difficulties in 1952, the Americas—the United States and Canada in particular—continued throughout the year on unprecedentedly high levels of production. England was still plagued by a lack of critical materials and equipment and the difficulties involved in building up exports sufficiently to enable it to get those things in the international market. Under the Pinay plan France continued its desperate attempts to prevent a complete collapse of the franc in runaway inflation. Other European areas showed similar signs of distress. In contrast, the United States, in spite of a prolonged steel strike, materials bottlenecks and a serious drought, achieved an annual gross production of about \$340,000,000,000 and a fairly steady employment rate of more than 62,000,000 throughout the year. Canada experienced a veritable boom supported by large exports of certain critical materials to the United States and by extensive investments in Canadian industry by individuals, firms and investment houses in the United States.

However, these two nations, in spite of their prosperity, were not completely free from difficulties. In Canada certain industries were hurt by the new international trade pattern and were demanding help; in the United States inflation continued to be

a chronic and constant irritant, which, combined in a rather grotesque way with high taxes, became one of the chief issues of the 1952 presidential campaign. The government was plagued throughout the year by continuing difficulties of economically retooling for defense out of a situation of high-level employment.

In the western world scientific economists were still held firmly by this situation to the "problem orientation" which had dominated their viewpoints during the entire post-World War II period. Three outstanding developments seem, from a close contemporaneous view, to have characterized their research and writings during 1952. First, there was an apparent sharpening of interest among economists in the factors underlying and results flowing out of technological change. It was hoped that some practical policy for stabilizing investment might come as a by-product of this concern. Second, price theorists were finding that the concept of power—mass power, competing power, bargaining power, collusive power and countervailing power—constitutes an important addition to the kit of analytical tools for the study of markets. Some of them hoped to be able to throw away before long the emotion-laden concepts of monopoly and pure competition. Third, economists were becoming confident enough in their knowledge of aggregative, income-flow theory to venture bold and definite predictions. They seemed to agree pretty generally that some time toward the end of 1953 the U.S. economy would face trouble with the slowing or stopping of defense spending and the housing boom, assuming, of course, that war would not spread before that time. But they maintained that a depression could be avoided with care and foresight. They believed they knew what the precautionary measures should be. Twenty-five years before they would not have been so bold. (G. J. C.)

Economic Stabilization Agency. An independent agency of the United States government, the Economic Stabilization agency is charged with administering the direct economic control phases of the defense mobilization program, as provided for in the Defense Production act of 1950 as amended. The agency consists of an office of the administrator and six constituent operating units: the Office of Price Stabilization; the Office of Rent Stabilization; the Wage Stabilization board; the Salary Stabilization board; the Railroad and Airline Wage board, administering wage and salary stabilization for employees subject to the Railway Labor act; and the National Enforcement commission, which administers certain enforcement penalties for all three wage and salary stabilization boards. It is the function of the Economic Stabilization agency to develop both short- and long-range programs for stabilizing the economy during the period of the defense emergency, and to advise and consult with other government agencies in regard to policies which affect stabilization. The agency was created on Sept. 9, 1950.

During 1952 the Economic Stabilization agency, assisted by a strong tax policy and the indirect control programs operated by other agencies, continued to protect the defense effort and the civilian economy from the threat of inflation. The magnitude of the problem is illustrated by the fact that defense expenditures steadily increased during 1952, and these additional expenditures were fed into an economy that had already been operating at full employment levels. According to figures published by the Council of Economic Advisers, the level of defense expenditures in the second quarter of 1952 was \$15,000,000,000 a year higher than in the second quarter of 1951. This huge stepping-up in the rate of defense expenditures and defense production was accomplished without unstabilizing the economy.

Consumer prices went up slightly more than 1% altogether

during the first eight months of 1952. In the same period, wholesale prices declined 0.8%. Adjusted hourly earnings in factories rose 1.5% during the first half of the year, or slightly more than the cost of living.

While part of the credit for the record of stability was the result of such indirect control measures as high taxes, the encouragement of savings and credit control (consumer credit control was suspended in May 1952 and abolished by congress the following month, and real estate credit control was suspended by congressional direction in Sept. 1952), there can be no doubt of the important role played by the direct control programs. On the price front there were many sectors, both at wholesale and at retail, where market prices were straining at ceilings and where sellers were constantly seeking upward ceiling adjustments. Similarly the restraint exercised by wage stabilization was indicated by the numerous wage board decisions which cut back wage increases voluntarily agreed to by employers. About 17% of all petitions for approval of higher wage agreements were either denied or modified by the wage board. The role of rent control in restraining rent increases was well recognized, as was indicated by the fact that about 60% of the communities previously covered by federal rent control took the necessary affirmative local action required under the Defense Production act amendments of 1952 to continue rent controls beyond Sept. 30.

Side by side with the areas in which controls played an active role in restraining inflationary pressures were some slack areas where inflationary pressures were absent. For such areas controls were relaxed. For a number of commodities ceiling prices were suspended—thus eliminating the burden of record keeping and reporting—until such a time as market prices might again reach certain levels. For some commodities price controls were entirely removed by administrative action.

The Defense Production act amendments of 1952, which went into effect July 1, removed authority to control prices of all fresh and processed fruits and vegetables, which represent 21% of the average family food budget. The new law also removed authority from the Wage Stabilization board to recommend settlements in labour disputes. In passing the new law, congress provided authority for the direct controls to continue until April 30, 1953. (See also PRICE STABILIZATION, OFFICE OF; RENT STABILIZATION, OFFICE OF; WAGE STABILIZATION BOARD.)

(R. L. PM.)

Ecuador. A republic on the west coast of South America, straddling the equator, after which it was named, Ecuador is bounded on the north and east by Colombia, on the east and south by Peru and on the west by the Pacific ocean. It has an area of 104,510 sq.mi. (including the Galápagos Islands, a dependency of 3,029 sq.mi.) and a population (1950 census of the Americas) of 3,076,933. About 60% of this figure represents Indians, 30% mestizos, 9% "whites" and 1% Negroes. Quito (pop., 1950 census, 212,873) is the capital; other major cities (with 1950 pop.) are Guayaquil, the main port (262,624); Cuenca (46,428); Riobamba (29,611); Jipijapa (7,605); Vinces (4,129); Chone (8,030); Ambato (33,908); Loja (18,200); and Latacunga (10,340). The predominant religion is Roman Catholicism. Presidents in 1952: Galo Plaza Lasso, until Aug. 31; thereafter, José María Velasco Ibarra.

History.—Some excitement accompanied the government's announcement on Jan. 24, 1952, that it would not renew a contract permitting Grace Line ships to anchor at Puná, off the Gulf of Guayaquil. This decision stimulated discussion of projects for new methods of handling problems of transportation and commerce in the coastal area, none of which was definitively formulated by the end of the year. Meanwhile, President Plaza,

continuing his program of economic reform, promulgated early in 1952 a new income tax law. This measure replaced 14 separate previously existing income taxes with a single law, and established new levies on large-scale agricultural units and undistributed profits of foreign and domestic firms. In April the U.S. Export-Import bank granted Ecuador credit of \$800,000 for use in reconstructing areas devastated by the 1949 earthquake.

From the political standpoint, the major event of the year was the presidential election held on June 1. Three forces participated in the contest. The first was led by former President Velasco Ibarra (1934-35, 1944-47), who announced his candidacy on Feb. 1; the second by Ruperto Alarcón Falconí, the Conservative candidate; and the third by outgoing President Plaza. The campaign was characterized by division within the Plaza camp. Salazar Gómez, originally the administration's candidate, withdrew from the race on May 8, when he was replaced by José Modesto Larrea Jijón; and the proadministration elements remained disunited on election day. Victory went to Velasco Ibarra, who received 153,934 votes compared with the 118,186 ballots cast for Alarcón Falconí, the more serious of the other two candidates. Plaza, the first Ecuadoran president to serve out the full four-year constitutional term since José Luis Tamayo (1920-24), surrendered the executive office to Velasco Ibarra in inauguration ceremonies on Aug. 31. (G. I. B.)

Education.—In the school year 1949-50 there were 2,544 government primary schools with 225,571 pupils, 390 municipal schools with 34,222 pupils and 357 private schools (mostly Roman Catholic) with 61,138 pupils. There were 73 government secondary schools with 16,999 pupils, 11 municipal schools with 2,515 pupils and 72 private schools with 7,882 pupils. Institutions of higher learning included four public universities with 4,512 students, the Catholic university of Quito (164) and the polytechnical school (58).

Finance.—The monetary unit is the sucre, valued at \$0.0660 U.S. currency, official rate, and \$0.0571, free rate, on Aug. 30, 1952. The budget for 1952 balanced ordinary revenue and expenditure at 465,000,000 sucres. Ordinary revenue in 1951 was 438,207,300 sucres; ordinary expenditure 438,100,400 sucres; total revenue (excluding autonomous entities) 725,888,900 sucres; total expenditure 712,490,600 sucres. The foreign debt in April 1952 was \$43,190,000; internal, 131,812,000 sucres. Notes in circulation on Aug. 31, 1952, totalled 515,000,000 sucres; gold reserves \$22,500,000; commercial banking deposits 496,000,000 sucres; government deposits 121,000,000 sucres; time deposits (June 30, 1952) 127,000,000 sucres. The cost of living index (food, Quito) stood at 122 in Aug. 1952 (1948=100).

Trade and Communications.—Exports in 1951 (Ecuadorian ports) totalled \$51,900,000; imports through the port of Guayaquil (about 90% of all imports) \$55,400,000. Chief exports were cacao (34%), coffee (30%), bananas (21%), petroleum (3%) and rice (2%). Leading customers were the U.S. (59%), Colombia (6%), Italy (6%), Germany (5%) and France (3%); leading suppliers, the U.S. (65%), Germany (7%), the United Kingdom (6%) and Belgium (6%).

The length of the nine nationalized railroad lines in operation in 1949 was 698 mi. Highways (1947) included 1,591 mi. of main roads and 1,121 mi. of branch roads. In 1948 there were 2,921 automobiles, 4,245 trucks and 945 buses. Radios in use on Jan. 1, 1951, were estimated at 45,000.

Agriculture.—Production of the principal crops in the 1950-51 crop year included cacao 30,707 short tons; coffee 210,000 bags of 132 lb. each; rice (paddy) 149,000 short tons. Exports in 1951 were coffee 275,000 bags; cacao 26,550 short tons; rice 5,500 tons; bananas about 9,975,000 bunches (50 lb. each). There were 1,600,000 cattle and 1,800,000 sheep in 1949. Forest exports in 1951 included tagua nuts 10,900 short tons; balsa wood 6,000 tons; rubber 600 tons.

Manufactures.—The most important manufacturing activity was the textile industry, which produced cotton (principally), silk, woollen and rayon textiles. The manufacture of *toquilla* (Panamá) hats was also important. Cement production in 1951 was 86,900 short tons.

Mineral Production.—Production in 1951 included gold 9,014 fine ounces (excluding placer production); silver 33,600 fine ounces. No copper or lead was produced in 1951. Production of petroleum in 1951 was 2,708,310 bbl. (J. W. Mw.)

Eden, (Robert) Anthony (1897—), British statesman, was born at Windlestone hall, near Bishop Auckland, Durham, Eng., and was educated at Eton college and at Christ Church, Oxford. In 1923 he was elected to the house of commons for Warwick and Leamington, which he thereafter continued to represent. In 1931 he became undersecretary of state for foreign affairs. He was made lord privy seal in 1934 and minister for League of Nations affairs a year later. Eden became foreign secretary in 1935 but resigned in 1938 because of disagreement with Neville Chamber-

lain's policy toward Italy. At the outbreak of World War II he returned to government as dominions secretary, and when Winston Churchill became prime minister in 1940 Eden was appointed secretary of state for war and, later that same year, foreign secretary. In 1942 he was leader of the house of commons, and in 1945, when his party was defeated, he was deputy leader of the opposition. In the same year Eden led the British delegation to the United Nations Conference on International Organization in San Francisco, Calif. When Churchill was returned as prime minister in 1951, Eden was appointed deputy prime minister and foreign secretary. Early in Feb. 1952 Eden took part in a series of four-power talks in London with Robert Schuman, Dean Acheson and Konrad Adenauer in which the relationship between the European Defense Community and the North Atlantic Treaty organization was discussed. In September Eden visited Yugoslavia for talks with Marshal Tito in an effort to settle the problem of Trieste. Following conferences with Leopold Figl in Vienna regarding a treaty to secure Austria's independence, Eden declared that the keystone of European peace was Austria.

On Aug. 1 Eden married Clarissa Spencer Churchill, niece of the prime minister. His marriage to Helen Beckett (1923) had been dissolved in 1950.

Education. As of Oct. 15, the outstanding educational events of 1952 in the United States were the following: (1) the continuing shortage in faculties, facilities and funds; (2) the steady rise in enrolments and progress in constructing and properly maintaining schools; (3) the struggle of the private colleges and universities to raise money to meet the increasing costs of operation and to offset the losses caused by declining enrolments; (4) the lack of noticeable progress in providing federal aid to public schools by means of congressional legislation; (5) the allotment by the Federal Communications commission of television channels to educational institutions and groups; (6) the grants of millions of dollars by private foundations for the promotion of education; (7) the death, at the age of 92, of John Dewey, the educational philosopher whose ideas had exerted wide influence on education in the United States and in some foreign countries; (8) the passing of a new G.I. Bill of Rights for veterans of the Korean war with educational provisions estimated as costing \$1,000,000,000 a year; (9) the shift in emphasis from the attack on public education to the United Nations Educational, Scientific and Cultural organization and to the teaching about the United Nations; (10) the eruption of a controversy regarding the place of the private, including the parochial, school in the United States; (11) the growing concern of educators and laymen with the question of the teaching of moral and spiritual values in the public school; and (12) U.S. supreme court decisions upholding the dismissal of school personnel for spreading subversive propaganda, approving the release of pupils to attend religious classes away from the public school and denying an attempt to invalidate the reading, without comments, of portions of the Old Testament in the public schools.

Statistics.—The annual enrolment estimate by the office of education of the Federal Security agency, for the school term commencing in the fall of 1952, was as follows: elementary schools and kindergartens, 26,064,000, a rise of 1,596,000 over the previous year; high schools, 6,263,000, a total of 95,000 more than in 1951-52; colleges and universities, 2,150,000, a decline of 75,000. The complete enrolment, 34,693,000, which also comprised the private and nursing schools, represented the highest figure in history, according to the office. Other federal statistics of interest and significance included the estimate of the need of at least 158,000 additional teachers to instruct the

record number of pupils, and the revelation that the United States spent \$6 less per pupil in the public schools during 1950-51 than during 1949-50.

The U.S. census bureau reported in June that, of the 87,675,000 persons of the population of the age of 25 and above, 7 of every 10 had completed elementary school, 1 of every 3 had been graduated from high school and 1 of 16 had obtained a college diploma. These data, compiled during the 1950 census, indicated that the people of the United States possessed more schooling than ever before, according to the bureau.

A survey by the *New York Times* in March disclosed that about 60% of the Catholic children of compulsory school age were attending parochial schools—3,035,033 in elementary schools and 611,123 in high schools. Catholic colleges and universities were reported as having an enrolment of more than 350,000. The combined enrolment of 4,000,000 below college level marked a rise of more than 35% during the past ten years. According to the *Official Catholic Directory*, a total of 1,545,220 public-school children were receiving religious instruction in released time classes under Catholic auspices. This publication also stated that the over-all figure of Catholic students on all levels of religious instruction, both in Catholic and public institutions, was 5,141,251.

In May, the National Council of the Churches of Christ in the United States released statistics on Protestant day schools. Whereas in 1937 there were 115,580 pupils in 2,054 schools, the year 1951-52 found a total of 187,292 in 2,904 schools, an increase of 61% during 15 years. The leading denominations sponsoring day schools were the Lutheran and Seventh-day Adventists.

Also in May, Torah Umesorah, a national society for the establishment and promotion of Jewish day schools, reported the existence of 148 Jewish day schools, 21 of them on the high school level, throughout the United States. This organization estimated the full enrolment as about 30,000. As in the cases of the other denominations, the number of schools and the attendance had increased markedly during the past decade.

Financially, education benefited from private foundations by many millions of dollars. The largest sums for 1951 were contributed by the Ford foundation (\$22,331,736) and the General Education board (\$14,352,666).

Federal Participation in Education.—Following his custom of previous years, Pres. Harry S. Truman urged congress in his State of the Union message in January to begin the "long-deferred program of federal aid to education—to help the states meet the present crisis in the operation of our schools." He also suggested that the government "help with the construction of schools in areas where they are critically needed because of the defense effort." At the same time, he stressed that "we urgently need to train more doctors and other health personnel, through aid to medical education." Nevertheless, the national legislative body undertook little or no action to provide funds for the improvement of education in those states which had difficulty with financing their school programs. On the positive side, congress passed in July a new G.I. Bill of Rights which would furnish to veterans of the Korean war the benefits of higher education. (See VETERANS ADMINISTRATION [U.S.]) In its approval of the constitution of the Commonwealth of Puerto Rico in May, congress stipulated that no state funds be expended on "elementary education established under nongovernmental auspices." Neither the bill to provide scholarship aid to college students who were needy but able nor the bill to apply the funds from offshore coastal lands for school purposes received favourable congressional attention. Other action by the government in behalf of education included the easing in March of the building controls on school projects and the grant, an-

nounced in April, of \$122,740,302 during the fiscal year ending June 30, 1951, to schools located in areas congested by federal defense activities.

Elementary and Secondary Education.—That the pupils of the public schools of the United States were not getting, on the whole, as good an education as they should have been receiving was evident from the results of a survey published by the *New York Times* in January. Based on reports from state commissioners of education, statements by correspondents of the newspaper and interviews with educators, this survey, in the words of Benjamin Fine, education editor, revealed that "over the nation 3,500,000 elementary and high school children—one out of eight pupils in the public schools—are suffering an impaired education because of inadequate facilities." Contributing in a large measure to this situation were the prevalent teacher shortages, especially in the elementary schools; the unprecedented enrolments; the impact of inflation on the budgets of the boards of education all over the country, with the result that funds were not sufficient for teachers' salaries and educational facilities; the shortage of steel and other critical materials used in the defense program, with the consequence that new school construction lagged far behind current and future needs; and the continual attacks by certain individuals and groups on the public schools. The "most hopeful aspect" of this survey was the organization of more than 5,000 citizens' groups in all parts of the country for the purpose of supporting public education. Much the same conditions were discovered in a check of 25 major cities in the same number of states at the time schools opened in the fall.

In the area of curriculum there were several interesting developments. The commissioners of education of the northeastern states—New England, New York and New Jersey—presented a report, "Education for Citizenship," a plan for improving the teaching of citizenship in elementary and high schools. The New York state legislature passed a law requiring public and private high schools, as well as state teachers colleges, to teach the effect of habit-forming narcotic drugs. In September, the board of regents of the state of New York introduced a new American history syllabus for public high schools which altered the approach from a topical to a chronological one and which placed more emphasis on the colonial and constitutional periods.

The debate on the achievements of elementary and high school pupils continued as in previous years. A questionnaire survey of business executives by the Commerce and Industry Association of New York disclosed much dissatisfaction with the abilities of high school students and graduates in spelling, arithmetic and writing. On the other hand, an 18-month study of the Pasadena, Calif., city school system, prompted by the widely publicized dismissal of Superintendent Willard Goslin in 1950, indicated that the citizenry was on the whole satisfied with the results of the newer educational practices and felt that the children were learning adequately the fundamental subjects.

A controversy, which reminded some of the national debate following the disagreement between Mrs. Eleanor Roosevelt and Francis Cardinal Spellman on the question of state subsidies for parochial schools, erupted early in April as a result of remarks by Pres. James B. Conant of Harvard university. Addressing the conference of the American Association of School Administrators in Boston, Conant called for the extension of public secondary education to encompass the nation's entire high school population. Several comments of his regarding the private school aroused considerable adverse comment and inspired many defenses by those who upheld his views. Typical of his attitude toward the place and function of the private, and inferentially the parochial, school in American education was the statement "The greater the proportion of our youth who attend independent schools, the greater the threat to our democratic unity."

When it became clear that Conant's sentiments had struck responsive chords among school administrators and other educators, proponents of the private school began to issue statements defending nonpublic education in the form of newspaper releases, letters to the editor, articles, editorials and leaflets. The opposition to Conant came largely from the National Catholic Educational association, non-Catholic private schools and secular independent schools. However, no serious signs of acrimony developed.

There was considerable evidence throughout the year that the educational profession and the public were deeply concerned about the problem of the teaching of religion in the schools. Much of this interest was manifested in various types of publications and in speeches. The keynote was instruction in moral, ethical and spiritual values in a manner calculated not to offend any religious denomination. Many cities and states issued syllabi to aid teachers in teaching secular moral values in the elementary and secondary schools.

Higher Education.—As in recent years, the colleges and universities of the United States were confronted again in 1952 by a serious financial crisis, caused principally by the inflationary situation and the decline in income and enrolment. A survey of 100 independent liberal arts institutions by the *New York Times* disclosed late in May that 50% of these colleges were operating on a deficit, that many were close to bankruptcy, and that the curtailment of educational services was widely prevalent. In spite of a vigorous campaign to raise funds among alumni, business corporations, foundations and other sources, it did not appear that the colleges and universities would be able to solve their financial difficulties with any degree of success. No less than 80% of the institutions covered in the *New York Times* survey maintained that it was far more difficult to raise money at this time than it was during the previous year. To meet this crisis, a number of well-known institutions resorted to increases in tuition fees.

There were also other measures to safeguard the financial status of higher education. The University of Rochester combined its male and female undergraduate colleges into a coeducational college of arts and science on a single campus. Groups of independent colleges in New York, Virginia, Texas, Indiana, Ohio and about 15 other states formed co-operative organizations to obtain more money from industry and business corporations, foundations and private persons in order to maintain the integrity of the smaller institutions of higher learning. Among the larger gifts during 1952 were a grant of \$7,000,000 by the General Education board to Emory university of Georgia for the development of a graduate school, and one of \$5,000,000 by the Old Dominion foundation to Yale university for the development of the liberal arts program and related purposes.

The passage by congress of the new G.I. Bill of Rights appeared as a boon to many colleges and universities. However, according to a survey by the *New York Times* in July, many leaders in higher education feared that the direct-payment provisions, under which the veteran rather than the Veterans administration pays the college for tuition, would favour the schools charging low tuition rates. On the other hand, Earl J. McGrath, U.S. commissioner of education, stated publicly his opinion that there would be no material change in the normal distribution of students between private and public institutions.

Another significant issue facing higher education during the year was the status of the athletes. The startling disclosures in 1951 of the West Point cheating scandal, the subsidies paid to varsity players in many colleges and universities and the prearrangement or "fixing" of basketball games were at the bottom of the wave of reform which swept the administration of college athletics all over the nation. The new year began with the

UNDERGRADUATES of Columbia university at the Barnard college dormitories during one of a number of "panty raids" that took place at U.S. colleges in the spring of 1952. Object of the raids was to invade the girls' dormitories and collect lingerie as souvenirs

publication of recommendations by a special committee of college presidents under the auspices of the American Council on Education. This committee, headed by Pres. John A. Hannah of Michigan State college, East Lansing, offered an athletic code which would change radically many of the practices long traditional in college sports. The new recommendations included the abolition of all postseason contests, the discontinuance of the use of freshmen on varsity teams and the granting of scholarships strictly on the basis of the educational ability and needs of the student. This move brought forth a quick response by the National Collegiate Athletic association to the effect that, while the philosophy and the general objectives of the presidents' committee were most laudatory, it did not agree with several of the key suggestions. However, on Feb. 16, the executive committee of the American Council on Education voted to accept the presidents' new code with but minor reservations. This action constituted a repudiation of the counterrecommendations by the National Collegiate Athletic association. Nevertheless, it did not appear that the new athletics control program would solve all the evils of excessive emphasis on college sports. Later that month, two important accrediting organizations, the Middle States and the New England Associations of Colleges and Secondary Schools, labelled the proposals of the American Council on Education as "unpracticable," maintaining that they lacked police powers to enforce the proposed regulations.

The question of academic freedom came under consideration in several important instances during 1952. Dismissals of instructors at Fairmont State college, W.Va., and the University of Minnesota, Minneapolis, on the alleged grounds of liberal political views, did not result in reinstatements after hearings and lawsuits. The former case, in fact, led to the dismissal of the college's president and the resignation of a dean and three faculty members. At Talladega college in Alabama, the board of trustees requested the resignation of the president and his entire administration after a three-year campaign by students, alumni and faculty. The transfer of a dean to teaching duties at Queens college in New York city gave rise to charges of outside pressure and infringement upon academic freedom.

With reference to the question of deferment of college stu-

dents from the draft, the Educational Policies commission of the National Education association and the American Council on Education issued a joint report in January under the title, "Education and National Security." The educators presented a three-fold plan to obtain the temporary deferment of students in order to allow them to complete their college work prior to entering upon their military service. This suggestion, however, caused considerable criticism to be hurled at its authors on the part of persons who suspected a request for special privileges for education. Also in January, the Association of American Colleges petitioned congress to defeat the program of universal military training which was under consideration. An announcement by Selective Service headquarters revealed that 39% of the 20,000 students who took the draft deferment tests in Dec. 1951 failed to qualify.

Other developments in higher education were as follows: the availability of numerous positions for the 1952 graduates; the expansion of the facilities of medical colleges; the admission of a freshman class of 7,381 for the academic year of 1951-52, the largest group in the recent history of medical education; the proposal by a committee of educators, headed by Dean Emeritus Harry J. Carman of Columbia university, for reforms in the educational program of premedical students; the dwindling enrolment in schools of nursing, as shown by a *New York Times* survey in March; the recommendation in April by the American Council on Education for Journalism that future journalists be given a broad general education rather than narrow vocational training in the junior colleges; the tendency noted in March by a *New York Times* survey that the programs of the colleges stressed the natural and applied sciences, as well as professional subjects, and that fewer students were enrolled in the liberal arts subjects; the wave of student pranks and riots, all highly publicized, during the spring at campuses all over the country; the availability of scholarships for 1 in every 20 students, according to an announcement by the U.S. office of education; the presence of more than 30,000 foreign students, a record number, at U.S. institutions of higher learning; the initiation of an experiment in 11 colleges, under the auspices of the Carnegie Foundation for the Advancement of Teaching, to improve undergraduate programs through greater faculty participation in the planning; and the admission by a former assistant U.S. commissioner of education that the government was practically helpless to close the fraudulent "educational" institutions which offer degrees for "correspondence courses."

The Teacher Situation.—The serious teacher shortage continued as in previous years. According to a survey in April by the National Education association, there were 32,443 new teaching graduates to meet the need for a minimum of 160,000 teachers in the elementary schools. On the high school level, the situation was better, with a supply of 62,692 candidates for 50,000 vacancies.

Several efforts were made to improve the education of teachers. Harvard university formulated a co-operative plan to enable the graduates of 21 eastern colleges to prepare themselves for teaching in the public schools and to obtain a master's degree in education. Funds for this purpose were provided by the Ford foundation's fund for the advancement of education. This foundation also allotted \$2,000,000 for 400 fellowships for high school teachers to expand their backgrounds in the liberal arts. A third project, a year of internship following the sequence of four years' work in general education, was offered to the state of Arkansas. This plan evoked much criticism from the American Association of Colleges for Teacher Education, which maintained that with the aid of large sums of money the foundation was interfering unwarrantedly with the established procedures of teacher training.

Adult Education.—In September, the National Education association reported the results of a national study of public school and public community-college activities in adult education in communities of 2,500 and over. The total of 4,744,256 students represented an increase of 1,744,256 in the past five years. Among the other interesting developments were the presentation of a series of radio programs, "The Jefferson Heritage," by the National Association of Educational Broadcasters; the granting of television channels to educational institutions and organizations; the publication of the 54-volume "Great Books of the Western World" under the editorship of Robert M. Hutchins and Mortimer J. Adler; and the passing of a congressional resolution in May setting up a committee to investigate the extent to which immoral, obscene and otherwise offensive books, magazines and comic books were being made available to the public by the mails or other means.

Race and Religion.—All eyes were focused in January on the U.S. supreme court, which was to have ruled on the constitutionality of the segregation of the races in education. However, the court delayed action then and again in October, but it announced that hearings would take place in December. In actual practice, segregation was being modified in some localities and upheld in others. Negro students were admitted to the graduate school of the University of Tennessee, Knoxville, and to the dental college of the University of Texas, Austin. The policy of segregation was discontinued in the schools of Alamogordo, N.M., and Cairo, Ill. In Delaware, the court of chancery ordered the admission of Negro pupils to white schools in two communities where the facilities were unequal for the two races, while in Baltimore the school board voted to allow some Negro boys to enter the Polytechnic institute. Unfavourable incidents regarding the breakdown of segregation took place in Virginia where the federal court upheld the state laws for separate schools; in Tennessee, where the state supreme court refused to hand down a decision as to whether the segregation laws were unconstitutional; in Florida, where the state supreme court dismissed the pleas of Negroes for admittance to the University of Florida, Gainesville; and in South Carolina, where the federal circuit court reaffirmed an earlier decision that separate schools are constitutional. Governors Herman Talmadge of Georgia and James F. Byrnes of South Carolina threatened to close all public schools of their respective states if the U.S. supreme court should rule against segregation. On the whole, it was apparent that, while there was still much resistance to the discontinuance of the system of segregated schools in the south, a definite change in attitude was in evidence; and, in any event, the pressure to end racial discrimination in education did result in vast improvements in Negro education.

The year 1952 saw two important decisions handed down by the U.S. supreme court regarding the problem of religion in the public schools. On March 3, by a six-to-three vote the court declared, in the case of *Doremus and Klein v. The Board of Education of the Borough of Hawthorne and the State of New Jersey*, that the state statute providing for the reading without comment of passages from the Old Testament each school day was constitutional. A similar vote by the court on April 8, ruled, in the case of *Zorach and Gluck v. The Board of Education of the City of New York*, that the practice of releasing public school pupils to attend religious classes outside the school buildings and grounds was similarly in consonance with the spirit of the U.S. constitution.

Communism and Academic Freedom.—Reports from various parts of the country indicated the prevalence of attacks on the public schools and the teaching profession throughout the year. In a majority of cases there were charges of alleged subversive, Communistic or un-American teachings in textbooks.

According to Benjamin Fine's summary of a *New York Times* nation-wide survey in May, "A growing censorship of school and college textbooks in this country is causing America's leading educators serious concern." Success in repudiating charges of subversion crowned the efforts of Sarah Lawrence college (Bronxville, N.Y.) and the Scarsdale (N.Y.) public schools. After a controversy of three months' duration, the board of education of Englewood (N.J.) adopted the state regulations regarding the selection of textbooks to replace the local rule which put responsibility for the selection of books with alleged propaganda passages on the individual teacher. Yale university rejected accusations of harbouring Communists on its faculty by issuing a detailed report by a special alumni committee. A rupture almost developed between the American Legion and the National Education association after the publication in the former organization's magazine of an article which accused the association of engaging in subversive educational activities. The rift was breached in August when the convention of the American Legion passed a resolution commending the N.E.A.'s efforts in behalf of Americanism. During the same month, the N.E.A. stated in a report that academic freedom must be perpetuated in order to resist the menace of Communism and that the public-school system was "democracy's greatest gift to civilization."

Early in March, the U.S. supreme court upheld the constitutional status of New York state's Feinberg law, a measure designed to remove from public-school positions all teachers and other employees who spread disloyal or subversive doctrines. This decision, which was opposed by three of the judges, provided the legal precedent against Communists in the school system. As a result of the refusal of some teachers to answer the questions of the U.S. senate internal security subcommittee, the New York city board of education dismissed six teachers in October. Likewise, for not co-operating with the senators regarding past or present membership in the Communist party, three professors of the city's municipal colleges were suspended. The most startling development during the subcommittee's investigation was the testimony of Bella V. Dodd, formerly a member of the Communist party's national executive committee, to the effect that there were about 1,500 Communists among the 1,000,000 teachers in the United States, many of them in the eastern colleges. According to the witness, the influence of these persons was far out of proportion to their actual numbers. Other actions against Communists included the passing of a resolution in August by the American Federation of Teachers not to defend any teachers who had been proved to be members of the Communist party, and the decision by the trustees of Columbia not to tolerate an avowed Communist on the faculty. The National Education association, while suggesting that American schools teach about communism and other types of totalitarianism, reaffirmed its stand against the employment of Communists as teachers. On the other hand, the American Civil Liberties union announced its opposition to any prohibition of the appointment or retention of teachers who held Communist or fascist views.

International Educational Relations.—The annual report of the Institute of International Education revealed increases in the numbers of foreign students in the U.S. and American students abroad. The institute spent \$8,000,000 in 1951 on exchange scholarship and travel grants for about 4,000 individuals. The U.S. state department announced in September that 800 Iranian students would attend U.S. colleges under the terms of a new agreement.

The United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) went ahead on the projects it had organized during the past few years. Among the new developments were an intergovernmental customs agreement to set aside

import duties on books, newspapers, educational films and other cultural and scientific materials necessary for the advancement of education; the approval of Spain, Libya and Nepal as members; and the sponsoring of a conference between German and American historians for the purpose of improving history instruction in both countries.

The U.S. department of state revealed in September that 1,257 Americans received appointments to study, teach or carry on research projects in 20 countries under the provisions of the Fulbright act. In June, the U.S. initiated the Point Four program in Ethiopia with an agreement to establish there an Imperial Ethiopian College of Agriculture and Mechanical Arts to be associated with the Oklahoma Agricultural and Mechanical college. Foreign informational services outside the capital were ordered closed in February by the Iranian cabinet. A new international teachers' organization, the World Confederation of Organizations of the Teaching Profession, was formed in August at Copenhagen, Den., by amalgamation of three existing bodies.

World Trends.—There were numerous events of interest and significance during the year in many countries. The minister of education in British Columbia, Can., opposed the plan to integrate the Catholic schools into the public educational system. Student disorders and strikes over political issues took place in Argentina, Cuba, Venezuela and Peru. The minister of education in Ecuador suspended several teachers of the Central Technical college of Quito for allegedly delivering inflammatory Communist lectures against "Yankee imperialism." The Argentine government approved the autobiography of Eva Perón, the president's wife, as a basic text in some school courses. To increase the teaching of nationalism in the schools, the governor of Buenos Aires recommended the exclusion of the writings of Mark Twain, Walt Whitman, Benjamin Franklin, Jacob and Wilhelm Grimm, Friedrich von Schiller, I. S. Turgenev, Robert Browning and other non-Argentine writers.

The American College of Louvain, Belg., which had been closed since 1939, reopened in September. The Netherlands government announced in January that the universities would offer courses to prepare students to help underdeveloped nations. Reports from west Germany indicated that the America Houses and reading rooms were evoking favourable responses from the German public. According to some observers, this was one sign of the growth of democratic sentiment. The opposition by the Roman Catholic hierarchy in Spain to the government's plan to reform the high school system was not supported by the Vatican. The Communist party of Yugoslavia intensified its propaganda efforts and organized a campaign to rid the press and the universities of western ideas. In the U.S.S.R., Latin was reintroduced into the middle schools after an absence of many years from the secondary curriculum. The anti-U.S. propaganda in the press and the schools was stepped up at various times during the year.

The Egyptian government reopened in February the Fuad I university of Cairo after a two-month discontinuance of classes resulting from student demonstrations and disorders. The council of Ulemas, or religious scholars, of Egypt's Al Azhar university declared authoritatively that coeducation was immoral, but there was no action by the government to discontinue the practice. Student agitations of a political nature against France took place in May in Cambodia. The Syrian government promoted nationalism by decreeing that all youth groups must rid themselves of non-Syrian associations. In Israel, the Hebrew university-Hadassah medical school awarded 62 medical degrees, its first graduation class in medicine. The Israeli elementary schools, severely affected by the economic crisis, were forced to curtail their programs.

The countries behind the "iron curtain" paid increased atten-

tion to the communization of the schools. The authorities of east Germany carried on a campaign to purge schools and public libraries of "undesirable" books. Much stress was laid during 1952 on the military training of east German youth. From Czechoslovakia came reports that the Communist leaders were considering the revision, for the third time in three years, of primary and secondary textbooks to bring them up to date with the current ideological changes. In Communist China there were campaigns against illiteracy, purges of prominent educators, programs of thorough indoctrination from the nursery to the university, and antiforeign, especially anti-U.S., propaganda.

(W. W. BN.)

Canada.—A report issued in 1952 showed the percentages of total revenue spent by each province on education, as follows: Newfoundland, 22.5; Nova Scotia, 25.8; New Brunswick, 20; Prince Edward Island, 19.1; Quebec, 17.2; Ontario, 24.8; Manitoba, 16.4; Saskatchewan, 15.8; Alberta, 19.9; British Columbia, 16.9. The Canadian Education association made a survey which revealed that new schools valued at a minimum of \$78,000,000 would have to be built annually to keep pace with school enrolments. Although assured that by 1955 Canada would be short 25,000 teachers and 1,000 schools unless there was federal aid to education, the house of commons voted 78 to 23 on April 21 against a resolution calling for federal educational grants to all provinces to equalize educational opportunity. It was the second time the commons had rejected such a proposal. By September the problem entered another stage when the Canadian school trustees' association launched a two-year research project to discover how much federal aid was needed for education, where it was needed and how it could be distributed. Many educational problems were highlighted by the reports that there were acute teacher shortages in Newfoundland, that Saskatchewan had to enrol 800 study supervisors to help overcome its teacher shortage, that Ontario was offering special inducements to high school students who would take short courses to teach the elementary grades where enrolment was increasing at the rate of 35,000 per year. After meeting Premier Maurice L. Duplessis' demand that a Quebec commission be appointed to apply the grants to Quebec universities voted at the 1951 session of parliament, a demand that had delayed all the grants, the federal government distributed \$6,900,000 to more than 90 higher-education bodies across the nation. The new money, however, barely enabled most of the recipients to beat their mushrooming costs, and little was left for urgently needed expansions and improvements. (C. Cy.)

United Kingdom.—In Aug. 1952 the dispute between the Durham county council and the teachers' and other professional bodies' associations, which began in Nov. 1950—when the council formally declared that every teacher in its employment should be a member of a trade union—was ended after recourse was had to arbitration. The council had previously conceded that their professional employees need not as a condition of employment belong to a trade union or professional organization, but had demanded that applications for extended sick benefits by such employees should be made through a trade union or professional organization. The arbitrators recommended the withdrawal of this rule, and the council agreed to do so.

In May the first experimental television program for schools was transmitted by the B.B.C. (British Broadcasting corporation). Six secondary schools in Middlesex took part in the experiment, which lasted four weeks, 20 programs being transmitted. Immediately after each program the pupils' reactions were elicited by B.B.C. and education officials, and there were later more follow-up investigations. First impressions were that television had much to offer if confined to topics, places and experiences which could not be easily presented by conventional

classroom methods. The 18-in. screen—the largest used—was declared to be too small.

Following the three months' "stand-still" order prohibiting the start of new school-building projects, issued in Oct. 1951 the minister of education announced in February the closure of the 1951-52 educational building program and the decision to compile a revised 1952-53 program from the balance of the 1951-52 and the existing 1952-53 programs. The total value of this was to be about the same as that of the original program. All effort was to be concentrated on providing places in primary and secondary schools to meet the increased school population and the needs of new housing estates, and in technical institutions to provide facilities for the more essential industries.

In October the first permanent school of remedial gymnastic and recreational therapy in Great Britain was opened at Wakefield, Yorkshire.

In February the government announced that, despite rumour to the contrary, it did not intend to shorten the period of compulsory school attendance (*i.e.*, 5 to 15 years). In April the minister of education relaxed the rule that candidates below the age of 16 might not take the examination for the general certificate of education. From 1953 on, younger pupils could be entered provided their head teachers would certify that it was educationally desirable for them to do so and that they might reasonably be expected to pass. In September King George's Jubilee trust announced that it would conduct a survey of the influences affecting young people from the time they entered primary school until the age of 20.

Eggs. Farmers in the U.S. in 1952 produced a record supply of more than 165,000,000 cases (24 doz. each) of chicken eggs. Varying consumption estimates were at a new high level of 406 to 412 eggs per person, compared with only 397 in 1951 and an anticipated 390 to 400 in 1953. There were 423,000,000 potential layers, hens and pullets, on farms at the beginning of the year. However, egg prices during the spring were down 18%, compared with the same months of 1951, and reached a low of 34 cents per dozen to producers in May, a level still unsatisfactory in relation to costs that farmers decreased by 7% the number of chickens raised for laying-flock replacement; hence the anticipated smaller production and higher prices in 1953. The surplus situation changed rather abruptly with the abnormally hot weather of June and July over much of the country, lowering egg quality as well as numbers. The substantial price rise which followed carried the average price to producers to nearly 49 cents per dozen in September but did not reach the 55 cents per dozen of 1951. The autumn period was one of record lay, 4% more than 1951 and 22% above average. Storage stocks of shell eggs were 2,160,000 cases in September, compared with a very low level, 1,615,000 cases, a year earlier and an average for 1941-50 of 5,320,000 cases.

Egg price-support programs, which since the beginning of World War II had cost the government more than \$200,000,000, were largely liquidated. Shell egg grades were revised effective July 1, 1952. An egg purchase program, which was terminated in June, involved only 226,000 cases to be delivered to the school lunch program. Export of eggs in the shell increased in

FORMER KING FAROUK (right) and former Queen Narriman (second, left) vacationing in Capri after Farouk abdicated the Egyptian throne in favour of his infant son, Ahmed Fuad, July 26, 1952

1951-52 to 37,558,000 doz. (20,951,000 doz. in 1950-51), whereas the export of dried eggs, mostly from Commodity Credit corporation stocks, declined to 21,342,000 lb. from 48,607,000 lb. in 1950-51.

World egg production failed to show any significant increase in 1951 over the previous year, and 1952 may have shown some cutback in production, particularly in those areas emphasizing commercial production for export. However, larger autumn production was anticipated in the United Kingdom. Hatching eggs were exempted by Brazil from import licence. (J. K. R.)

Egypt. An independent kingdom of northeast Africa. Egypt is bounded north by the Mediterranean, south by the Anglo-Egyptian Sudan, east by Israel and the Red sea, west by Cyrenaica and the Sahara. Area: 386,110 sq.mi. Pop.: (1947 census) 19,038,529; (mid-1951 est.) 20,729,000. Language: mainly Arabic (97%), with minorities speaking Greek, Italian, Armenian, etc. Religion: Moslem (mainly Sunni) 91.4%; Christian (mainly Copt) 8.19%; Jewish 0.4%. Chief towns (pop., 1947 census): Cairo (cap., 2,100,506); Alexandria (925,081); Port Said (178,432); Tanta (139,965); Mahalla el-Kubra (115,509); Suez (108,250); Mansura (102,709). Rulers in 1952: King Farouk I; infant king Ahmed Fuad II with a three-member regency council (from July 26); Prince Mohammed Abd el-Moneim, sole regent (from Oct. 13). Prime ministers in 1952: Mustafa el-Nahas, Aly Maher (from Jan. 27), Ahmed Naguib Hilaly (from March 1), Hussein Sirry (from July 2), Ahmed Naguib Hilaly (from July 20), Aly Maher (from July 23), and Maj. Gen. Mohammed Naguib (*q.v.*) (from Sept. 7).

History.—The year 1952 began under the shadow of the continuing conflict with Great Britain. The conflict, which had entered its most serious stage after the unilateral denunciation of the Anglo-Egyptian treaty of 1936 by the Egyptian government on Oct. 27, 1951, was engaging the serious attention of both governments at the beginning of the year. In the canal zone violence increased, and a rumour that the British were intending to appeal to other maritime powers to help in keeping open the canal provoked from Egypt a solemn warning to the governments of the United States, France, Norway and the Nether-

lands that such assistance would be regarded as an "unfriendly act."

On Jan. 26 serious riots occurred in the capital. At first anti-British, the riots became antiforeign and anti-Jewish before evening when King Farouk called upon the army to restore order. There were about 60 deaths, including the Canadian trade commissioner and a number of prominent British residents. Many important buildings were destroyed or damaged, among them Shephard's hotel, the British-owned Turf club, the French chamber of commerce and the Swedish and Lebanese legations; 15 states subsequently protested to the Egyptian government.

Meanwhile the king dismissed the Wafd government, and on Jan. 27 Aly Maher formed a cabinet of Independents which received the unanimous approval of both houses of parliament. Aly Maher sought to bring about a united front of all parties. He set up an all-party committee on Anglo-Egyptian relations, laid great stress upon the maintenance of order, and attacked the economic grounds of popular discontent by ordering price cuts in such basic commodities as sugar and paraffin. He reiterated the demand for Egypt's "national aspirations" but expressed willingness to discuss the proposal for a four-power middle east command which had been made at the beginning of the period of crisis. Abd el-Fattah Amr, in London for the funeral of King George VI, saw the British foreign secretary, and preparations were made for a resumption of Anglo-Egyptian negotiations.

On March 1, however, Aly Maher resigned because, it was believed, of disputes in the cabinet about a proposal to prorogue parliament during the negotiations. His successor was Hilaly, who took office with a cabinet composed of Independents and one Wafdist on March 1. Parliament was prorogued for one month, Fuad al-Awal university was closed and great emphasis was laid upon the elimination of corruption from public life. Hilaly had been expelled from the Wafd in Nov. 1951, after giving evidence against one of the party's leaders, and corruption was its most vulnerable issue. Thus his term of office, which lasted until June 29, was dominated by that party's

CARTOON by Sweigert published in the *San Francisco Chronicle* in 1952

hostility to him. His single Wafdist supporter was expelled and he was attacked for betraying Egypt's national interests and for "tyranny." Counterattacking, Hilaly accused the Wafd of using the "national aspirations" as a means to power, placed Fuad Serag ed-Din, its second most important leader, under house arrest and continued with his investigations of official corruption. Negotiations with Great Britain were resumed and the situation in the canal zone steadily improved, but the publication on April 2 of the Sudan draft constitution caused resentment in Cairo. Meanwhile the energetic prosecution of the corruption investigations was making powerful enemies for the prime minister, whose resignation at the end of June was followed by 48 hours of confused political manoeuvring.

On July 2 this was ended when Hussein Sirry became prime minister for the fourth time at the head of a cabinet of Independents. Sirry resigned, without explanation, on July 20 and was replaced by Hilaly, whose cabinet included the provocative appointment of the king's brother-in-law as minister of war.

During the night of July 23 there occurred a dramatic coup d'état, under the direction of Maj. Gen. Mohammed Naguib, the consequence of which was to put all the institutions of modern Egypt into the melting pot. General Naguib was a hero of the Palestine war, and his election as president of the Cairo Officers' club had been regarded as a sign of the discontent of the younger officers. The military seized a number of important points in the capital, including the broadcasting station, from which at 7 A.M. General Naguib announced that the army had taken control "to force a return to constitutional life and to purge the army of corrupt elements." His declaration that the army had no intention of interfering in politics was of necessity soon to be falsified. He proclaimed himself commander in chief and Maher succeeded Hilaly as prime minister with another cabinet of Independents. On July 26 the new regime demanded and obtained the abdication of King Farouk, who sailed from Alexandria the same day for Italy. His infant son was proclaimed king as Ahmed Fuad II, and a three-member council of regency appointed.

The extent of popular discontent with the old order was reflected in the general enthusiasm for General Naguib. All

parties hastened to acclaim his actions. Mustafa el-Nahas, the Wafd leader, whose most important rival had gone with the abdication, flew back from a European holiday to greet the general and subsequently declared that tyranny had been exterminated. But it quickly became clear that other, and perhaps less generally welcome, changes were in contemplation. The titles of pasha and bey were abolished, and the inquiry into scandals in respect of armaments was reopened under the charge of the original general prosecutor, Mohammed Azmi. He had previously been removed by the Wafd.

The new regime originated from the middle ranks of the army officers who had come to express the widespread discontent of the middle classes after the military failures of the Palestine war. Their aspirations were reflected in the declared general aims of the government—the attack on corruption in public life, the purging of the political parties and the breakup of the great estates.

It was probably the insistence upon the rapid dispossession of the landlords without regard to the effects on Egyptian economy which led, on Sept. 7, to the resignation of Aly Maher. General Naguib became prime minister. Most political parties removed leaders who were suspect to the new rulers of Egypt. But the Wafd made some show of resistance before the resignation of Fuad Serag ed-Din was followed by that of Nahas, on Oct. 6. Meanwhile, as unity against the old order gave place to differences of opinion as to future policy, divisions began to appear among the group of officers that had stood behind General Naguib. Col. Mohammed Rashad Mehanna was dismissed from the council of regency on Oct. 13 and Bahei ed-Din Barakat, the second regent, resigned, so that Prince Mohammed Abd el-Moneim remained the sole regent. General Naguib's personal power appeared to be growing. (See also AGRICULTURE; ANGLO-EGYPTIAN SUDAN; MIDDLE EAST; SUEZ CANAL.)

(H. S. D.)

Education.—Schools (state and private 1950–51): kindergarten 23, pupils 84,030; primary 6,583, pupils 1,332,543; technical 139, pupils 31,477; secondary 177, pupils 126,176; secondary boarding schools 13, pupils 22,944. Teachers' colleges 52, pupils 11,408. Universities 3, students 30,910. Other institutions of higher education 8.

Finance and Banking.—Budget: (1951–52 est.) revenue £E215,200,000, expenditure £E231,400,000. National debt (April 1948) £E125,000,000. Currency circulation (Aug. 1952) £E190,800,000. Gold and foreign exchange (March 1952) U.S. \$464,000,000. Bank deposits (May 1951) £E167,300,000. Monetary unit: Egyptian pound with an exchange rate of £E0.975 to the pound sterling and £E0.349 to the U.S. dollar.

Foreign Trade.—(1951) Imports £E232,100,000, exports £E203,100,000. Main sources of imports (1951): U.K. 18%; U.S. 15%; France 9%; Italy 7%. Main destinations of exports: U.K. 19%; India 15%; U.S. 10%; Italy 8%. Main imports: machinery and vehicles 17%; wheat 15%; metals and manufactures 7%. Main exports: cotton (raw) 81%; rice 7%.

Transport and Communications.—Roads (1947): 8,874 mi. Licensed motor vehicles (Dec. 1950): cars 59,000, commercial 17,000. Egyptian state railways (1949): 5,318 mi. Shipping: merchant vessels, 100 gross tons and over (July 1951) 55; total tonnage 92,813. Telephones (1951) 115,500. Radio receiving sets (1949): 183,000.

Agriculture.—Main crops (metric tons, 1951): maize 1,421,000; wheat 1,194,000; barley 99,000; millet and sorghum (1949) 567,000; rice, paddy 620,000; sugar, raw value 192,000; onions (1950) 217,000; potatoes 174,000; broad beans (1950) 232,000; lentils (1950) 47,000; cotton, ginned (1950) 377,000. Livestock (March 1947): cattle 1,321,000; sheep 1,875,000; goats 1,474,000; asses 1,125,000; horses 28,000; mules 12,000; camels 197,000; buffaloes 1,240,000; pigs 50,000; chickens 16,312,000. Fisheries (1948): total catch 48,350 metric tons.

Industry.—Crude oil production (1951): 2,328,000 metric tons. Raw materials (metric tons, 1949): phosphate rock 350,000, manganese ore 138,000, salt 350,000. Manufactured goods (metric tons, 1951) cement 1,130,400; cotton yarn 31,200; cotton piece goods 173,000,000 sq. m.

Eire: see IRELAND, REPUBLIC OF.

Eisenhower, Dwight D. (1890–), the 34th president of the United States, was born on Oct. 14 at Denison, Tex., but his parents moved to Abilene, Kan., when he was a year old. He was graduated from the U.S. Military academy at West Point, N.Y., in 1915, finishing 61st in a class of 164. In June 1942, during World War II, he

FORMAL PORTRAIT of Gen. and Mrs. Dwight D. Eisenhower with their daughter-in-law, Barbara Jean (née Thompson) and three grandchildren (left to right) Dwight David, Susan and Barbara Ann. Gen. Eisenhower's son, Maj. John Sheldon Eisenhower, was serving with the armed forces in Korea in 1952

as named Allied commander of the European theatre of operations and headed the invasions of North Africa and Europe that led to the defeat of Italy and Germany.

On returning to the United States at the end of the war, he became chief of staff of the army, taking an important part in the demobilization and unification of the armed forces. He resigned from active service on Feb. 7, 1948, to become president of Columbia university. He was recalled to active duty in Dec. 1950 as head of the North Atlantic treaty forces in Europe, and resigned that post as of June 1, 1952, to conduct a campaign for the Republican presidential nomination. He was nominated on July 11, and with his running mate, Sen. Richard M. Nixon (*q.v.*) of California, elected on Nov. 4.

On July 1, 1916, Eisenhower married Mamie Geneva Doud of Denver, Colo. Their first son, Doud Dwight, died of scarlet fever at the age of three. A second son, John Sheldon Doud, was born in 1922. After graduation from West Point, he saw service in World War II and was serving in Korea at the time of his father's election.

Although Eisenhower had been mentioned as a presidential possibility before the end of World War II, he dismissed that idea when, in 1948, many prominent Democrats proposed him as their candidate. He declared that he did not believe a military man should serve in that position except under extraordinary circumstances. When he first registered as a voter in New York in 1948, he did not list himself as a member of any party.

In Jan. 1952 Sen. Henry Cabot Lodge of Massachusetts announced that he would enter Eisenhower's name in the first presidential primary of the year in New Hampshire. At Paris, Eisenhower confirmed Lodge's statement that he was a Republican and also said that he would accept the nomination, if it were offered, but that he would not conduct a preconvention fight for it. At that time many of his backers thought that his prestige

alone would enable him to gain the honour in a "complete draft."

But they were forced to modify their strategy when Sen. Robert A. Taft of Ohio began to wage an aggressive campaign. Although Eisenhower carried the New Hampshire, New Jersey, Massachusetts and Pennsylvania primaries, Taft won in Nebraska and showed strength in the middle west. In early April Eisenhower's resignation as supreme commander, Allied powers in Europe, was announced, to be effective June 1. Asking inactive status, he said he would resign completely only if he were nominated. He returned to the United States on June 1.

He opened his campaign inauspiciously on June 4, when he dedicated an Eisenhower museum at Abilene. Heavy rains marred the affair, and his drenched civilian clothes stripped him of military glamour. He spoke haltingly and in generalities on the issues of inflation, bureaucracy, corruption and "class antagonisms threatening the American way of life."

In a newspaper interview on the following day, in which he showed talents that developed in later stages of the campaign, he gave his views on major issues. He said that he had no prescription for ending the Korean war, but called the loss of China an "international disaster"; that he would summon the "best minds" to Washington, if elected; that he backed the administration's policy of collective security in Europe; that he favoured a free economy and a minimum of legislative controls; that he would not scrap the social and economic gains achieved under Franklin D. Roosevelt and Harry S. Truman; that he would drive Communists from government without endangering civil liberties; that he had no panacea for peace, but was willing to confer with Joseph Stalin.

In order to contribute to party unity, he conferred with Senator Taft in New York in September, a reconciliation which provoked Democratic charges that he had become the "captive" of his convention rival. When he endorsed other midwest senators noted for conservative and isolationist views, he was assailed as having surrendered to party reactionaries.

Eisenhower waged a tireless and extensive campaign, travel-

ling 50,000 mi. and making more than 200 speeches. He drew vast crowds on an invasion of the deep south. Toward the close of the contest, he concentrated on Truman's alleged "coddling of Communists" and foreign policy features, especially in the far east.

His Nov. 4 triumph was interpreted as a tribute to his personality, his qualities of leadership and the belief that he would satisfy the widespread demand for a "change at Washington," for he ran far ahead of the party's state and national candidates almost everywhere. He carried 39 states against 9 for Gov. Adlai E. Stevenson, the Democratic nominee; he won Virginia, Florida and Texas, and almost all the normally Democratic border states. The popular vote, the largest ever cast, was 33,927,549 for Eisenhower and 27,311,316 for Stevenson.

(See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.; UNITED STATES.) (R. Tu.)

Elections, U.S. The year 1952 was an election year for the American people. For a period of ten months issues, personalities and parties in successive elections at all levels and of varying degrees of finality filled the newspapers and were given wider attention on the air and on the screen than in any previous year in United States history. The outcome, measured in votes cast, indicated that this concentration of interest on politics had been widespread, and that it did not diminish with the national election on Nov. 4.

The year began with interest in party primaries for the choice of presidential convention delegates. The actual voting in the states extended over the period from March 11 to June 3 in the following order: New Hampshire, Minnesota, Nebraska, Wisconsin, Illinois, New Jersey, Pennsylvania, New York, Massachusetts, Maryland, Ohio, West Virginia, Oregon, Florida, California and South Dakota. Primary elections were optional in three other states, Alabama, Arkansas and Georgia, and were set by state committees. Fifty-seven primary elections in senatorial contests, in contests for congressional nominations and for state officers were held in the period between Feb. 19 and Sept. 24.

Maine, in September as usual, held its state election and elections in senatorial and congressional contests. In the vote of Sept. 8 the Republicans won all contests, selecting one senator and three representatives. The margin of victory was not so great as the Republican leaders had hoped, and this fact gave some comfort to the Democrats. A day later the primaries in Wisconsin gave an impressive victory to Sen. Joseph R. McCarthy, who had been under unusual fire because of the nature of his attacks upon "Communists." In Texas the Democratic state convention voted to support Gen. Dwight D. Eisenhower, the Republican candidate for president. In New Hampshire and Vermont Republican victories were foreshadowed, as in past years, in the primaries.

By Oct. 13 the elections (and primaries followed by no contests) had designated 82 to membership in the house of representatives. Seventy-five of these were Democrats, most of them from the southern states. Seven were Republicans, for 4 of whom there had been no contest and 3 of whom had won in the September elections in Maine. Two seats in the senate had been won by Republicans. Frederick G. Payne in Maine and William F. Knowland in California ("elected" in the primary which gave him both major party nominations). In Mississippi, Texas and Virginia, the Republicans offered no opposition to the Democratic senatorial candidate. In 11 southern states the Republicans had not entered candidates for the house of representatives in 70 districts. Primary contests in California, due to cross filing, yielded 6 Democrats and 7 Republicans "without party affiliation" in the final election and therefore "elected" in the primary.

In the presidential election in November there was no "minor" party interest and uncertainty as there had been for years earlier. At that time the candidacy of Henry A. Wallace on the Progressive ticket and of J. Strom Thurmond on the States' Rights Democrat ticket had appeared to weaken the major party appeal—the first in the north, the second in the south. There were, however, ten nominees for the presidency in 1952 from long familiar parties (Progressive, Prohibition Socialist and Socialist Labor), and from less well known groups (Socialist Worker, Church of God Bible, Greenback, Vegetarian, Washington Peace and Poor Man's). The 12 nominees were

Dwight D. Eisenhower	Republican
Adlai E. Stevenson	Democrat
Vincent W. Hallinan	Progressive
Darlington Hoopes	Socialist
Farrell Dobbs	Socialist Workers
Homer Tomlinson	Church of God Bible
Eric Hass	Socialist Labor
Fred C. Proehl	Greenback
Stuart Hamblen	Prohibition
Herbert Holdridge	Vegetarian
Ellen Jensen	Washington Peace
Henry Krajewski	Poor Man's

Attempts to organize would-be supporters of Gen. Douglas MacArthur failed to secure any recognition from him. Although workers on his behalf had formal organization in 7 states (Missouri, Arkansas, Texas, North Dakota, Washington, California,

*Blank and void ballots in large numbers in New York and Massachusetts and to a small degree in some other states are not included in the above table in the "other" column. They go to make up the total voter turnout in the nation, but not the actual vote for president. "Blanks" are ballots marked for various state and local candidates and unmarked for the presidential column. "Voids" are ballots thrown out for improper marking, etc.

†New York's Democratic vote included 416,711 Liberal party votes for Gov. Stevenson.

‡South Carolina's Republican vote of 158,312 is actually the vote for "Independent" electors for Eisenhower. It is placed in this column because it is the highest vote for a Republican candidate got in the state and is the one counted officially toward his national popular total. Another state of electors under the Republican label polled only 9,801 votes—these are placed in the state's "other" column along with a single minor party vote—9,801 cannot be added to the Eisenhower total because they are votes for a separate list of electors.

Tabulated by the Associated Press from state canvassing board reports.

and Tennessee) under various designations including America First, Christian Nationalist and Constitution; and although it was expected that votes would be "written in" in 13 states—the outcome proved that such MacArthur support had no effect upon the final result in any state.

On the eve of the final vote (Nov. 4) there was a general opinion, aside from the political managers, that the presidential election would be close; that the defection of Republican Sen. Wayne Morse of Oregon (made final on Oct. 24) seriously threatened the probability of a Republican majority in the new senate; finally that only a Republican landslide would make at all possible a Republican majority in the house of representatives.

The vigour with which the election campaign was concluded was indicated by the fact that 75,600,000 names were on the registration lists, abnormally large in every section of the country outside the south.

The vote in the presidential election was cast in 146,370 precincts. Of this vote Eisenhower had 33,927,549; Stevenson,

27,311,316; and candidates for the minor parties, 308,996. The electoral vote, which reflects victory by states, was 442–89, Stevenson carrying only nine of the southern and border states. The percentage of the total popular vote going to the winner was 55.1. Stevenson, however, had 3,200,000 more votes than were cast for the Democratic winner, Harry S. Truman, four years earlier, and 44.4% of the total vote of 1952.

All agreed that it was a great personal triumph for Eisenhower, and the general feeling was that it was an overwhelming repudiation of the Truman administration. The house of representatives was to have a slender Republican majority. As had been anticipated, a senate majority was in doubt. Although Connecticut had elected two Republican senators and Nevada had elected a Republican, the distribution was 48–48, counting

Senator Morse as not voting with the Republicans, which would provide a tie in the senate, which could be broken by the deciding vote of the new vice-president, Richard M. Nixon.

Thirty-five senators were elected in the course of the year. Republicans with 23 winners gaining 1 seat despite the defection of Sen. Wayne Morse of Oregon to an "independent" position shortly before the November election. The Democrats, claiming 12 winners, lost 2 seats in the senate.

Democratic senators who were defeated in 1952 included Ernest W. McFarland of Arizona, William Benton of Connecticut, T. R. Underwood of Kentucky, Blair Moody of Michigan,

and Joseph C. O'Mahoney of Wyoming. Republican senators who lost the election were Henry Cabot Lodge, Jr., of Massachusetts, James P. Kem of Missouri, Zales N. Ecton of Montana and Harry P. Cain of Washington. Noteworthy was Republican Sen. William Jenner's victory over Democratic Gov. Henry F. Schricker of Indiana, who was a favoured nominee for the senate. Senator McCarthy of Wisconsin, although re-elected, did not poll the heavy vote anticipated because of the great endorsement given him in the primary.

In the 83d congress, one Independent (Frazier Reams of Ohio) retained his seat, won in 1950 and again in 1952, in a contest against both Democratic and Republican nominees. The summary for the house stood on Dec. 1, 1952, as 213 Democrats and 221 Republicans. Although the majority for the Republicans was one-half the majority held by Democrats in the 82nd congress, there could be no doubt that the Republicans would organize the house, the first time since their mid-term victory in 1946.

Despite the overwhelming interest in the presidential contest, there had been throughout the year vigorous campaigning in 30

gubernatorial contests. The results showed victories for the Republicans in two-thirds of these contests.

The distribution of the presidential vote showed, first of all, that the Republican nominee had run far ahead of his ticket. An examination of the vote by state and county, and in particular by metropolitan area, seemed to show that the great increase in vote did not go to the Democratic nominee, as had been freely predicted even by neutral observers. Political commentators appeared to agree that a large number of organized labour votes in the industrial centres had not gone to the Democratic nominee, who had been endorsed by the leaders of the three large labour organizations. It seemed probable that a considerable portion of the Negro vote, which had shown large increases in northern cities, had broken away from the Democratic party. Apparently a majority of the farmers, as represented by organized groups, had returned to the Republicans. Notably, previous patterns of voting in distinctive geographical areas had been broken by the continued and accelerated westward movement of population. Finally—and a significant portent for the future—registration by party apparently was no longer a safe guide as to final party voting, as shown particularly in California.

As was to be expected, many assertions were made after the result of the election became known to the effect that in great numbers women and new voters of both sexes had supported the Republican ticket because of the unpopularity of the long-continued war in Korea. There was no acceptable proof of this. Nor was the assertion that the defeat of Stevenson in Florida, Virginia and Texas was caused by a "new ferment in politics" backed by substantial evidence. One of the wisest comments was to the effect that the combination of special interests—radical (particularly labour), conservative (represented by southern states) and moderate (substantially the city population)—that had so long given majority support to Franklin D. Roosevelt and then Truman had been broken. This, more than anything else, had given to the Republican ticket "the endorsement of the American electorate on a truly national basis."

Not until Dec. 15 (the first Monday after the second Wednesday in December) did the state electors meet in the respective state capitals. Their votes were transmitted to Washington, D.C., and on Jan. 6, 1953, at a joint meeting of senate and house (of the expiring 82nd congress), they were counted and

the result proclaimed.

On Nov. 5, the day following the election, President Truman had sent to General Eisenhower the following message: "Congratulations on your overwhelming victory. The 1954 budget must be presented to the Congress on Jan. 18. All preliminary figures have been made up. You should have a representative meet with the Director of the Budget immediately. The Independence will be at your disposal if you still desire to go to Korea." This message underlined the vital importance of joint pronouncements in the period prior to inauguration of the new president on Jan. 20. The reply of General Eisenhower indicated his appreciation of the situation and emphasized his plan to go to Korea. President Truman then invited General Eisenhower to a conference at the White House to make "clear to all the world that this nation is united in its struggle for freedom and peace." This conference was held on Nov. 18. (See also COMMUNISM; DEMOCRACY; POLITICAL PARTIES, U.S.; UNITED STATES; and under various states.) (E. E. R.)

Electrical Industries. The continued high level of general business activity during 1952 was reflected in the record activity of the electrical industry.

Production of electric energy by electric utilities in the United States totalled 388,490,903,000 kw.hr. during that year. This was an increase of 8.1% over the 359,289,919,000 kw.hr. produced during 1951. Electrical power plants of industrial concerns, including the stationary plants of electric railroads and railways, produced an additional 62,082,402,000 kw.hr. during the year. The total production of electrical energy was therefore 450,573,305,000 kw.hr., an increase of 6.9% over the 421,341,383,000 kw.hr. produced during 1951.

Of the total energy produced by electric utilities for the public supply 280,830,635,000 kw.hr., or 72.5%, was generated by fuel-burning power plants. An additional 107,660,268,000 kw.hr. was generated by water power plants.

Net imports of electrical energy from Canada increased 19.9% from 1,574,809,000 kw.hr. to a record 1,887,809,000 kw.hr. during 1952.

Coal consumption by electric utility power plants during 1952 reached 105,144,529 tons. This was 1.5% greater than the 103,609,993 tons used during 1951. The use of gas as a fuel by the nation's electric utilities increased 4.7% from 722,504,482,000 cu.ft. during 1951 to 856,670,307,000 cu.ft. during 1952.

This increase in the use of gas was offset by a marked decrease in the consumption of fuel oil, amounting to 8.8%. During 1952, 60,413,747 bbl. were consumed as against 65,504,564 bbl. during 1951.

The quantity of coal and estimated coal equivalent of other fuels consumed during 1952 amounted to approximately 155,604,000 tons.

Of the total energy output during 1952, privately owned electric utilities produced about 81%. Plants owned by rural electric co-operatives, municipalities, public utility districts, state projects and the federal government produced the remainder.

Power Plant Capacity.—Reports received by the Federal Power commission during Oct. 1952 indicated that the installed capacity of generating plants in utility service totalled 78,757,545 kw. on Sept. 30, 1952. The installed capacity a year earlier was 74,291,432 kw., indicating an increase of 4,466,113 kw. during the 12-month period.

Of the total capacity installed on Sept. 30, 1952, 19,593,861 kw. were installed in hydroelectric stations, 57,079,838 kw. in steam stations and 2,083,846 kw. in internal-combustion engine stations.

Preliminary estimates set the noncoincident peak load at 80,000,000 kw., indicating an increase of 13.6% over the 70,400,000

kw. noncoincident peak experienced during 1951.

Ratios of fuel and hydro generating capacity remained little changed in 1952 over 1951. In the earlier year, fuel-burning capacity was 74.9% of the total and hydro capacity 25.1%. In 1952 the ratios were 75.1% and 24.9%.

Private companies owned approximately 80% of the nation's generating capacity. Ownership of the remaining capacity was divided among the rural electric co-operatives, municipalities, public power districts, state agencies and the federal government.

Electricity Sales.—Electric utility customers purchased 333,537,083,000 kw.hr. during 1952. This was an increase of 8.5% over the 307,460,889,000 kw.hr. purchased during 1951. Sales of electrical energy to residential customers showed the largest increase, 13.5%. Sales to this class of customers totalled 83,699,914,000 kw.hr. during 1952, and 73,715,018,000 kw.hr. during 1951. During 1952 the sale of electrical energy to residential customers accounted for 25.1% of the total.

Sales of electric energy to large industrial users accounted for 48.8% of the total, 163,238,211,000 kw.hr. This was an increase of 6.6% over the 153,167,816,000 kw.hr. sold during 1951 to this class of customers.

The average residential use of electricity rose from 1,947 to 2,119 kw.hr. per customer, an increase of 172 kw.hr.

Revenues.—Customers paid the suppliers of electricity \$5,960,856,900 in 1952, almost \$500,000,000 more than in 1951, a 9% increase. This was associated with an 8.5% increase in sales.

Residential customers continued to enjoy a decrease in the unit price they paid for electrical energy, 2.77 cents during 1952 as against 2.83 cents during 1951. Because of their increased use of electricity, 2,119 kw.hr. in 1952 against 1,947 kw.hr. during 1951, residential customers paid an average annual bill of \$58.70, contrasted with a bill of \$55.10 during 1951. This was an increase of 6.5%.

Residential customers during 1952 contributed the largest share of any class of customers to the total revenue of the electric power industry, \$2,321,031,400. This was 39% of the total.

Users.—The number of electric utility customers as of Sept. 1, 1952, was 47,910,344, an increase of 1,695,693 since 1951. The largest increase continued to be in the residential class which rose 1,538,011 to total of 40,181,786. Industrial and commercial customers rose from 5,765,368 to 5,878,925 during 1952.

Electrical Manufacturing.—Manufacture of heavy electric power equipment, which suffered severe setbacks in 1951 because of material shortages, proceeded at an accelerated rate during 1952. This was made possible by improvements in the material situation. Production schedules were at peak levels. Total capacity of electric generating equipment shipped during 1951 was 7,528,100 kw. Reports received from manufacturers early in the year indicated that during 1952, 12,416,500 kw. had been shipped or were scheduled for shipment during 1952.

During the first half of 1952 manufacturers of refrigerator sold an estimated 1,700,000 units. Sales during the second half of 1952 were expected to equal those of the first half. Sales during 1951 totalled 4,075,000 units. Sales by manufacturers of television sets were approximately 2,300,000 during the first half of 1952. Sales during the second half of 1952 were approximately 2,500,000. This indicates a drop in sales during 1952 of 585,000 sets from the 5,385,000 sets sold during 1951. (See also PUBLIC UTILITIES; RURAL ELECTRIFICATION; TENNESSEE VALLEY AUTHORITY.) (AR. MO.)

Canada.—Pressed by urgent demands from a booming economy, which ran nearly 200,000,000 kw.hr. above the 1951 figure, the electrical generating industry expanded in practically every province. This increase was reflected in the fact that all

though the export of power to the United States was 100,000,000 kw.hr. per month greater in 1952 than in 1951, the export measured in percentage of national output fell to 4.5% in mid-1952 compared with 6.2% in 1944. The bulk of the increase in production capacity came from hydroelectric expansion in Ontario, where new sources permitted production to rise 77% above 1951, which meant that Ontario was producing 30.3% of the national total, against 25% in 1944. Quebec, however, retained its lead in production by accounting for 51% of the national total. The most spectacular production gains came from British Columbia, where the 1952 output was 80% greater than in 1951.

Production in 1952 of electrical equipment and general appliances totalled roughly \$750,000,000. Major plant extensions during 1952 were valued at \$35,000,000. (C. Cv.)

Great Britain.—In spite of growing competition from electrical manufacturers abroad, including that from Germany where rapid recovery from World War II was evident, English makers of heavy electrical plant were very fully occupied in 1952 and found it necessary to increase their manufacturing capacity to cope with the large orders received in the previous year. One large manufacturer, for example, received orders for 1,500,000 kw. of generating plant during 1951.

There were signs that the period of development of the gas turbine as a successful prime mover for electricity generation was ending. The construction and testing of several units of capacities between 500 and 3,600 h.p. was completed and the first 15,000-kw. gas turbine-driven generator for the British Electricity authority was put into commission.

A project for using atomic energy for power production was started, following encouraging results obtained at the Atomic Energy Research establishment at Harwell, and it was hoped to have the first experimental unit operating in 1956–57.

The national need to conserve coal aroused great interest in public discussions on the use of electricity for space heating. On one side it was claimed that the electrical energy used was generated largely from unexportable slack which could not easily be used otherwise, that the over-all efficiency of such heat production was about 20% and was rising with that of the power stations themselves. Against this it was urged that modern domestic stoves and grates, in the design of which outstanding progress had been made, had a high efficiency and should be widely used, especially since domestic electric heaters made a serious contribution to the peak demand. There was general agreement nevertheless that the use of electric heaters was economic for heating periods of a few hours' duration.

The report of the Ridley Committee on National Policy for the use of Fuel and Power resources, published in September, favoured competition between the various fuel and power industries. It considered that the 100% purchase tax on electric fires should continue because of their contribution to peak load problems but that the purchase tax on hot-cathode fluorescent tubes should be abandoned. Following their wide adoption in Ireland, thermal storage heaters, using solid blocks of high heat capacity and providing an off-peak load, were introduced in Great Britain for factory and office space heating.

The use of electricity for power purposes on farms was increasing rapidly, especially in crop drying; platform or in-sack grain driers were being widely adopted. Artificial illumination by high-pressure mercury vapour lamps was being used for seedlings. A newly built tomato packing station at Waltham Cross, believed to be the largest in Europe, used electrical methods extensively for handling, grading and cold storage.

Electrical methods of fishing in inland waters and for whaling were being developed.

At the fourth British Electric Power convention a group of

papers described the research being done by different sections of the industry. It was estimated that about 1% of the £1,000,000,000 annual turnover of the industry was being spent on research and development.

In the manufacturing industry, research was concerned with the development of steels and alloys for the construction of boilers and gas turbines. These materials, to withstand high temperatures and mechanical stresses, must have high creep- and corrosion-resistance and are difficult to work; research was proceeding on improved methods of working. A new nickel-chromium alloy, nimonic 95, was introduced.

Permalloy F, a new nickel-iron alloy with high permeability and low coercive force, was developed. In expectation of the use of high-voltage cables for underwater transmission, such as in the proposed channel crossing, co-operative research among cable manufacturers was in progress. The shortage and high price of copper and of dielectric materials encouraged research on the use of alternatives. Methods of construction using stranded aluminum conductors and aluminum sheaths were being investigated, as were the potentialities of plastic or synthetic dielectrics. Experiments were made on new applications of laminated wood insulators.

Research in lamp manufacturing was concerned with the many kinds of glass for new lamps operating under various conditions, with investigations on tungsten and molybdenum, on calcium halophosphate powders and other phosphors. The applications of lamps giving bactericidal radiation were being studied.

For the first six months of 1952 the volume of exports of electrical goods, apparatus and machinery was about 10% higher than the 1951 average. The total value of such exports for the month of July was £14,746,089, compared with £13,974,738 for July 1951. For electrical goods and apparatus, as distinct from machinery, India was the best customer in this month, with South Africa, New Zealand, Australia and Malaya following in that order.

For the first six months of the year the total value of electrical goods and apparatus exported to Norway was £974,891; the monthly average in 1938 was only £12,881.

The results of a statistical survey of shops showed that in metropolitan boroughs and towns of more than 100,000 inhabitants in Great Britain there were 15,566 retailers of electrical goods, appliances, accessories and fittings. The density was 3.2 shops per 10,000 persons. (E. W. G.)

Electric Transportation. The improvement in rapid transit facilities was the most significant development in electric transportation in the United States during 1952. Operations of electric surface railways were somewhat curtailed, following the trend in other recent years, but trolley coach operations continued to expand. Few significant changes occurred in the field of heavy electric traction.

Rapid Transit Lines.—Eight new rapid transit construction projects estimated to cost \$445,650,000 were approved by New York city's board of transportation. The most important of these was a proposed new trunk-line subway under Second avenue in the borough of Manhattan. The others were connections and extensions to existing routes. Approval by the board of transportation, however, was only the first step in a long and complicated process of obtaining approvals and consents. For that reason it was not anticipated that actual construction work would start in the near future.

Ground was broken early in the year for a \$30,000,000 rapid transit project at Cleveland, O. This was a new, east-west 13-mi. route on a private right-of-way, adjacent to the main-line railroads and passing through the downtown section of the city at Public square. Orders were placed for 70 P.C.C. (Presidents'

Conference committee) rapid transit cars for operation on the new line.

Opening of the East Boston tunnel extension represented the greatest transportation improvement in many years in the Boston, Mass., metropolitan area. About $2\frac{1}{2}$ mi. in length, this extension was partly underground and partly on the surface where it utilized the right-of-way of a former narrow-gauge steam railroad. Forty new P.C.C. rapid transit cars were provided for this operation and 24 older type cars were modernized and equipped with new motors.

Financing was arranged by the Chicago (Ill.) Transit board for the purchase of 300 new subway-elevated cars to operate the new rapid transit extension under construction in the median strip of the Congress street superhighway. With the delivery of these new cars, only 200 more units would be required to give the Chicago rapid transit system a complete equipment of all-metal cars. The Logan square-Milwaukee avenue subway completed its first year of operation in Feb. 1952. Its time-saving features proved very popular and attracted about 50% more riders than had used the elevated railway service which it replaced.

At Philadelphia, Pa., a proposal came before the city council for a ten-block extension of the Broad street subway to provide a link with the proposed South Philadelphia Delaware river crossing and the Schuylkill expressway. The cost of the project was estimated at about \$7,000,000.

The improvements in rapid transit facilities made during 1952 and other recent years had had little effect on the over-all extent of rapid transit facilities in the United States. At the beginning of 1952 there were 1,217 mi. of rapid transit track in operation compared with 1,230 mi. in 1935. During this period the number of rapid transit cars declined from 10,416 to 9,644. Those in service, however, were of somewhat larger capacity, so that the total carrying capacity remained about the same. The total number of passengers carried by rapid transit systems was 2,236,000,000 in 1935 and 2,189,000,000 in 1951, the latest year for which complete figures were available. Only in the matter of operating revenue had there been a marked change. As a result of an upward trend in fares, operating revenue increased from \$131,000,000 in 1935 to \$214,700,000 in 1951.

Suburban Electric Lines.—Occupying a place between rapid transit and electrified trunk-line railroad operation are a number of suburban electric lines. The largest of these, the Long Island railroad operating between New York city and many suburban communities, had been in financial difficulties for several years. During 1952 the Long Island Transit authority, created by the state of New York to work out a solution of the problem, presented a reorganization proposal under which outstanding obligations would be greatly reduced and replaced by 20-year bonds. The authority hoped, if the plan were approved, to modernize and rehabilitate the railroad, run it at a modest profit and ultimately lease or sell it to private enterprise.

Another suburban electric line which found itself in difficulties during the year was the Staten Island Rapid Transit railway. Permission was asked by the company to discontinue all passenger service and to limit its operations to freight haulage.

Surface Electric Railways.—A gradual reduction in the scope of operation of electric surface railways in the United States had been taking place for some time. This trend continued during 1952. Moderate amounts of street railway trackage were abandoned in Chicago, Ill., Boston, Mass., Pittsburgh, Pa., Minneapolis, Minn., Newark, N.J., Wilkes Barre, Pa., and elsewhere. In some instances trolley-coach service was substituted in place of rail service, and in other instances motor buses replaced electric cars. A number of interurban electric rail lines were

also abandoned during the year, being replaced by motor bus service.

Trolley Coach Operation.—In contrast to the steady decline in electric rail operations, there was a steady growth in electric trolley coach operations. With some 600 new vehicles of this type delivered in 1951, trolley coach operating companies expected to approach an all-time peak in the number of passengers carried in 1952. The previous peak year, according to statistics of the American Transit association, was 1949 when a total of 1,661,000,000 trolley coach passengers were carried.

An estimated total of 7,500 trolley coaches were expected to be in operation in the United States before the end of 1952, a figure almost equal to the number of surface electric railway cars. Continuous trolley coach expansion was anticipated because of the relatively low cost of operation of this type of vehicle and its universal popularity with the riding public.

At Detroit, Mich., a public opinion survey showed that more than 87% of the passengers riding trolley coaches were in favour of this type of service and would like to have more of it operated in the city. In Chicago, trolley coaches replaced motor buses on the 47th street line. The Chicago avenue line was also converted to trolley coaches during the year. At New Orleans, La., plans were completed for the substitution of trolley coaches in place of motor buses on the Tulane line. Boston, Indianapolis (Ind.), Wilkes Barre and Shreveport (La.) were among other cities which expanded their trolley coach operations during the year.

Estimates of electric transportation vehicle requirements for 1953 presented by the industry to the Defense Transport administration included 650 rapid transit cars, 50 P.C.C. street cars and 425 electric trolley coaches.

Heavy Electric Traction.—No developments of marked significance occurred in the field of heavy electric traction during 1952. One new electric locomotive was delivered and placed in operation. Test runs were made on the Great Northern and the New Haven railroads of a new type of electric locomotive equipped with alternating current commutator motors. The mileage of electrified trunk-line railroad track remained virtually unchanged.

(J. A. MI.)

Canada.—The increase in automobile ownership, a shortened work week, widespread fare increases and transit strikes curbed urban electrical transportation during 1952. The fare increase brought similar results in various cities: in Montreal, Quebec there was a decrease of 1,329,000 passengers in a 20-day period in October; in Ottawa, Ont., there were 359,982 fewer passengers during the first month (January) of the increase; in Toronto, Ont., there were 265,000,000 passengers (estimated) in 1952 against an actual total of 302,000,000 passengers in 1951. There were also fare increases in Kingston, Ont., Hamilton, Ont., Vancouver, B.C., New Westminster, B.C., and Calgary, Alta., and the results were similar. The Toronto transit strike of Jan. 4-22 resulted in a 15% drop in revenue when the service was resumed; patronage lost to other means of transport was slow in returning. By Feb. 1952 trolley bus monthly mileage throughout Canada approached half that of electric streetcars; since in Feb. 1948 streetcar mileage was ten times trolley bus mileage, a remarkable change in a relatively short time was indicated. To some extent, the conveniences of trolley travel, when compared with streetcar travel, were credited with helping to maintain electric transport earnings: urban revenues in Feb. 1952 totalled \$9,734,000 compared with \$8,709,000 in Feb. 1951; revenues in May 1952 were \$10,015,000 compared with \$9,208,000 in May 1951.

(C. CY.)

Europe.—Progress in electric traction during 1952 was again marked in those countries which already possessed considerable electrified systems. Developments in France were the most im-

interesting and the completion of the Paris-Lyons electrification and the agreement to apply the 50-cycle single-phase system to the Valenciennes-Thionville line were especially noteworthy. In the Netherlands, not only had the lines destroyed in World War II been re-electrified by 1948 but the postwar program, except for the section from Arnheim to Zwolle, had been completed. Electric trains on the principal main lines and diesel electric trains on branch lines had largely eliminated steam.

Improvements in design were directed largely to weight-saving and to the reduction of maintenance. This was illustrated by the French National railways' decision to build power bogie locomotives despite the excellent performance of the 2-D₀-2 type. Prototypes were under construction with several new features in mechanical design. Investigations into the 50-cycle system were continued on the Aix-les-Bains-Annecy line with locomotives and multiple unit stock using either multi- or single-anode rectifiers with D.C. traction motors or 50-cycle A.C. motors.

In Europe electric traction was decisively ahead of steam power in making the fastest timings and the greatest mileage runs at high speeds. This was largely because of the remarkable accelerations on the Paris-Lyons lines, but considerable credit must be given also to the great recovery in speed in Italy where the list was headed by the rapido from Piacenza to Bologna which covered 91.2 mi. in 74 min., an average of 73.9 m.p.h. Electric locomotive performance in Switzerland was high. With the new federal Re 4/4 B₀-B₀ locomotives of 57½ tons, speeds of 75 m.p.h. were sustained up a gradient of 1 in 100 with 300-ton trains.

(J. W. GR.)

The last London street railway car ran on July 5; the cars were replaced by buses. In Blackpool the first of a new class of single-deck streetcars, each having four 45 h.p. motors, were put in service. (See also LAW; RAILROADS.)

(E. W. G.)

Electrification, Rural: see RURAL ELECTRIFICATION.

Electronics. With the development of commercial jet planes that cruise at speeds of 500 m.p.h. or more, the problem of detecting possible obstacles ahead becomes even more important than with slower-moving aircraft. At such speeds warning is required not only of mountains and high ground but also of turbulent clouds.

To meet this need a British firm, E. K. Cole Ltd., Southend-on-Sea, Eng., developed an anticollision radar for commercial flights, which was tested by British Overseas Airlines corporation on one of their new Viking jet passenger planes. The device sent pulses of radio waves of 3-cm. length with a power of 10 kw., and it proved capable of reliably detecting cloud formations 40,000 ft. high at a distance of 40 mi. Clouds at 25,000 to 30,000 ft. in height could be detected at 10 to 30 mi.

An electronic airborne device for detecting radiations from the site of an atomic bomb blast, which had been used in checking effects of bombs used in tests by the Atomic Energy Commission at Eniwetok atoll, was announced when security regulations on it were lifted. Developed in the General Electric company's tube department, it is an ion chamber of much smaller size than other gamma-ray detectors of similar type and sensitivity.

Argon gas is compressed to 50 times atmospheric pressure in steel tube less than 7 in. in length and ¾ in. in diameter. Radiation permits the gas to conduct a current between two electrodes, and the amount of gamma radiation is registered on a meter. One form was used as a protective device in research planes flying high over the blast site immediately following the dispersion of the mushroom cloud, while another was used at a height of a few hundred feet to determine the intensity of radiation on the ground.

In the past the lives of many victims of sea disasters had been lost, even after the survivors were located from the air, because surface craft could not reach them in time. To prevent this the U.S. air force developed a 30-ft. lifeboat that could be carried by a B-29 to the place when it was needed, dropped to the water with a parachute, and then guided by radio from the mother plane to the survivors. The controls on the boat, which operate either by radio signals from the plane or automatically after having been set for a particular course, were designed by engineers of the Westinghouse Electric corporation, Pittsburgh, Pa.

A radarlike device that gives warning of automobiles, or even pedestrians, approaching a gatehouse while they are several hundred feet away, was put into use at the General Electric Research laboratory near Schenectady, N.Y. It was developed by W. C. White, C. L. Andrews and H. S. Lasher, utilizing some of the principles of the proximity fuse which, when attached to an anti-aircraft shell, make the shell explode when it merely comes near an aeroplane.

By means of an 18-in. parabolic reflector, a beam of 13-cm. radio microwaves is directed down the approach road. A vehicle approaching on the road returns an echo, which is picked up by the reflector and the transmitting antenna. The returning waves pass in and out of step with those going outward, every time the vehicle causing the echo moves through one wave length of about 5 in. The electronic circuit detects such changes and an alarm bell is sounded, thus warning the guard even though his attention might have been temporarily diverted.

A method of utilizing ultrasonic waves, which are like sound waves but of too high a frequency to be audible, to detect intruders in a closed room was developed by the Alertronic Protective Corporation of America, New York, N.Y. The waves are sent out from a transmitter and picked up by a receiver—some directly, others after they have been reflected from walls and other objects in the room, which set up a constant pattern as long as they are stationary. However, if some object or person moves, the motion alters the frequency of the reflected waves. The receiver detects such changes and operates an alarm.

Another possible use for ultrasonics, in detecting cancerous tissue in the body at an early stage, was developed by John M. Reid and John J. Wild, of the department of electrical engineering of the University of Minnesota, Minneapolis. They found that while such tissue does not show in X-rays, it does reflect ultrasonic waves more strongly than does normal tissue.

To test this they adapted a war-developed radar training device using ultrasonic waves in water to simulate radio waves in air. It yielded vibrations of 15,000 cycles per second in brief pulses, at the rate of 400 to 4,000 pulses per second. The waves were emitted from a crystal, thence transmitted through a column of water to the tissue being tested. The response was shown on the screen of a cathode ray oscillograph. In one case a brain tumour was located by such means, and an operation confirmed the location.

In order to get the best prices, tomato growers must carefully grade their product by colour, a task usually performed by cutting selected vegetables in half and comparing them visually with standard colour photographs. This may be speeded with electronic apparatus developed by Traver J. Smith of Magnuson Engineers, San Jose, Calif., in consultation with Richard A. Huggins of Huggins laboratories, Menlo Park, Calif.

The tomato halves are placed in a drawer which slides into the machine where they are illuminated. An arrangement of phototubes and light filters measures the relative reflectance for red light and blue light, the ratio being an index of the ripeness. Unripe tomatoes reflect blue light considerably better than red, but as they ripen the two colours are reflected more

nearly equally.

Another group in California, Industrial Electronic Engineers, Hollywood, devised a combination electronic and magnetic means of identifying unlabelled food cans. Fruits for canning must be processed and canned immediately, but steam and water used in cooking would remove any labels. However, there must be some way to show what a particular can contains.

So-called "tin" cans consist of sheet iron coated with tin, and the iron enables them to be magnetized. The new machine puts a group of magnetized spots on the base of the can, arranged in one of nine different patterns, each of which indicates contents of a particular kind. This is done as soon as the fruits are canned, before cooking. Though the heat partially destroys the magnetization, enough remains to be read off with another device.

The cans are rotated at 3,600 r.p.m., close to a group of coils, and as the magnetic spots pass the coils an alternating current is induced. Its frequency and other characteristics are automatically analyzed, thus showing the contents of the cans, which are then directed into the proper path.

A possible new use for electronic computing machines was in forecasting the weather. A group at the Institute for Advanced Study at Princeton university, Princeton, N.J., under the direction of John von Neumann, with the aid of Jule G. Charney who did the meteorological work, developed a special machine for a system of numerical forecasting which considers many more data than a human forecaster can utilize. It was estimated that an expert human calculator, working with a desk type machine, would take two years to complete a single day's forecast. In one test, however, the machine did the work in three hours, and it was estimated that the time could be reduced to less than an hour.

In Aug. 1952 the U.S. weather bureau announced plans to install such a calculator. This would prepare eight charts each day, for eight separate horizontal levels, from the ground up to 13,000 ft.

Another new computer, called RAYDAC (for Raytheon Digital Automatic Computer) and developed for the bureau of aeronautics of the department of the navy by the Raytheon Manufacturing company, Waltham, Mass., was intended to analyze the behaviour of guided missiles during test flights. It was said to "worry" about the results of its calculations through a checking system which enables it to recognize when it makes a mistake and then halt operation. The source of the error is shown the operator by indicators on the control panel. Meanwhile the work done up to that point is preserved so the machine can continue where it left off.

The important task of handling aeroplane passenger reservations was accomplished by another type of electronic "brain," called the "magnetronic reservisor," a joint development of the Teleregister corporation, New York, N.Y., and American Airlines. It was installed in the air line's offices at LaGuardia field, New York city. Formerly such reservations were made by several hundred clerks, answering phone calls from agents or passengers. The inventory of space available was kept on a large availability board on which about 2,400 separate unit plaques were posted.

In the new machine the inventory for ten days ahead is kept on two "memory" drums, revolving at 1,200 r.p.m. These are covered with a magnetic material, and the actual record consists of minute magnetized spots which are made, read or erased by a complicated electronic circuit. Ticket agents are provided with a small desk unit, connected over leased wires with the machine at LaGuardia field. The agent presses buttons to reach the machine and to request data. Then lights show the space available. Pressing more buttons records the reservations he

wishes to make. Cancellations may be effected in a similar way. Though developed for ticket reservations, the machine was said to be applicable in any business where a complicated inventory must be kept, subject to quick and accurate changes.

Electric sparks, controlled electronically, may be used to machine hard metals, in a device developed by Sparcatron, Ltd. of Gloucester, Eng. The piece of material to be machined and the electrode, which takes the place of the tool in conventional machines, are both immersed in a liquid dielectric which flows in order to carry away the disintegrated metal particles. The result from sparks produced at the rate of 12,000 to 100,000 per second. The workpiece has positive polarity and the electrode is negative, so there is maximum erosion of the work and very little of the tool.

A significant electronic development of recent years was the transistor, a tiny bit of plastic, wire and germanium, which could do much of the work formerly done by larger vacuum tubes. The General Electric company demonstrated a transistor megaphone which can amplify the speaker's normal voice into a loud shout. No external connections of any kind are required. The amplification is accomplished with transistors, and the small amounts of power which they need are supplied by tiny batteries inside the unit.

A new unit for use by musical organizations was an electronic drum developed by Harry Stockman of Stockman Electronic Research corporation, Waltham, Mass. An electronic circuit operates a leather-covered hammer which beats on the drum. It can develop higher beat rates than a human drummer, while volleys of beats may be repeated accurately and with the same quality. (See also STANDARDS, NATIONAL BUREAU OF.)

Elementary Education: see EDUCATION.

Elizabeth II (ELIZABETH ALEXANDRA MARY) (1926–) British queen, was born in London on April 21, the daughter of the duke and duchess of York, who later became King George VI and Queen Elizabeth. Her earliest years were spent principally at her father's London home and at the royal lodge at Windsor, and, during the summer months at Balmoral and at Glamis, the home of her grandfather, Lord Strathmore. Her general education was supervised by her governess, Marion Crawford. Her succession to the throne was at the time never looked on as more than a remote possibility, but with the abdication of Edward VIII her position as the eventual occupant of the throne seemed assured.

In the autumn of 1940 she made her first broadcast, a short talk to British children who were separated from their homes by the war, and her first public engagement without her parents was on May 31, 1944, when she was installed as president of the National Society for the Prevention of Cruelty to Children. On Nov. 20, 1947, she was married to the duke of Edinburgh, formerly Prince Philip of Greece, and on Nov. 14, 1948, gave birth to a son, Prince Charles Philip Arthur George. A daughter, was born to the royal couple on Aug. 15, 1950, and was christened Anne Elizabeth Alice Louise.

King George's illness in 1951 threw a heavy burden of work and anxiety on the princess, but after a delayed start she and the duke were able to make a tour of Canada, including a visit to Washington, D.C. She and the duke began on Jan. 31, 1952

Table I.—Number of Employees in Nonagricultural Establishments, by Industry Division, United States*

Industry division	(In thousands)			
	June 1952	May 1952	April 1952	June 1951
Total estimated employment	46,378	46,320	46,258	46,567
Mining	827	894	897	927
Contract construction	2,663	2,517	2,410	2,686
Manufacturing	15,487	15,671	15,784	15,956
Transportation and public utilities	4,163	4,138	4,098	4,161
Trade	9,836	9,744	9,817	9,732
Finance	1,978	1,959	1,953	1,893
Service	4,839	4,795	4,748	4,835
Government	6,585	6,602	6,551	6,377

*The estimates include all full- and part-time employees in private nonagricultural establishments who worked during, or received pay for, the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded. These employment series have been adjusted to bench-mark levels indicated by social-insurance agency data through 1947.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review*.

from June 1951.

Females in the civilian labour force totalled 19,926,000 in June 1952, representing an increase of 459,000 over the June 1951 total of 19,467,000. The number of unemployed females declined from 813,000 in June 1951 to 680,000 in June 1952.

The number of employees in nonagricultural establishments was 46,378,000 in June 1952, a decrease of 189,000 from the total of 46,567,000 in June 1951. During this period the following divisions of nonagricultural employment showed an increase: transportation and public utilities (+2,000); trade (+104,000); finance (+85,000); service (+4,000); government (+208,000). These increases represented a continuation of the 1951 trend, although the rate of increase had declined considerably. Large declines in nonagricultural employment occurred in manufacturing (−469,000) and in mining (−100,000). Within the category of mining, the greatest declines occurred in bituminous coal (−72,900) and in iron mining (−27,300).

Approximately two-thirds of the decline in manufacturing employment between June 1951 and June 1952 occurred in the durable goods industries, where employment declined by 309,000. The declines were greatest in the primary metal industries (−412,000), fabricated metal products (−49,000) and automobiles (−55,000). The decline in employment in durable goods industries as well as the decline in mining were primarily the result of the steel strike which began on June 2, 1952, and continued until July 24, 1952.

Employment also declined by 160,000 in the nondurable goods

ELIZABETH II, photographed in the Irish state coach, on her way to open parliament on Nov. 4, 1952, the first major state duty of her reign

to tour to Australia which she was to undertake on behalf of her father, but news of the king's death on Feb. 6 reached her at Kenya, on the first stage of their journey, and she returned to England on Feb. 7. On the following day, when she was proclaimed queen, she spoke to the accession council of privy councillors in St. James's palace.

Her first public engagement as queen was when she distributed the Maundy money in Westminster abbey on April 10. From the start of her reign she followed her father's practice of giving a weekly audience to the prime minister.

Employment. United States.—The civilian labour force (persons not in the armed forces and available for employment) numbered 64,390,000 in June 1952, which represented an increase of 607,000 over June 1951. (Data on the net strength of the armed forces and total labour force were not available after Jan. 1951.) Coupled with this increase in the civilian labour force was a decline in unemployment. The June 1952 total of 1,818,000 unemployed was 162,000 less than the June 1951 total of 1,980,000.

Males in the civilian labour force increased from 44,316,000 in June 1951 to 44,464,000 in June 1952. This increase of 148,000 reversed the decline of the preceding year period which was caused by the build-up of the armed forces following the outbreak of the Korean war. The number of civilian unemployed males in June 1952 was 1,138,000, a decline of 29,000

GRADUATING CLASS of engineers at Stevens Institute of Technology, Hoboken, N.J., listening to a representative of the General Electric company explain employee benefits and openings in 1952. An acute shortage of trained engineers was even greater in 1952 than in the preceding year

industries between June 1951 and June 1952. Gains in employment did occur in some nondurable goods industries such as printing, petroleum products and tobacco, but these were far outweighed by the losses in the textile, apparel and paper products industries.

Table III.—Indexes of Production Worker Employment and Weekly Pay Rolls in Manufacturing Industries*

(1947-49 average = 100)

Period	Employment	Weekly Pay Roll
1939 (average)	66.2	29.9
1945 "	104.0	87.8
1946 "	97.9	81.2
1947 "	103.4	97.7
1948 "	102.8	105.1
1949 "	93.8	97.2
1950 "	99.2	111.2
1951 "	105.4	129.2
1952 "	102.5 (6 mo.)	130.0 (5 mo.)

*Data have been adjusted to levels indicated by social-insurance programs for 1947 and have been carried forward from 1947 bench-mark levels.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review*.

Preliminary figures for July 1952 indicated a continuation of the downward trend in durable goods manufacture and a slackening of the downward trend in nondurables. In this month the number of employees in nonfarm establishments stood at 45,941,000, which was 491,000 less than a year earlier. The employment situation was strongly affected by the steel strike, and it was estimated that nearly 900,000 workers were off industry pay rolls in mid-July 1952 because of the strike. About one-half of the workers affected were employed in the metalworking industries.

In July 1952 employment in durable goods manufacturing was 8,251,000, or about 580,000 less than in July 1951.

Between July 1951 and July 1952 employment in nondurable goods manufacturing fell by 121,000. However, within the nondurable group, gains in employment were scored in printing and publishing and leather products.

The employment and weekly pay roll indexes for manufacturing industries reflected the effects of the steel strike upon in-

dustry. The employment index for manufacturing industries decreased from 105.4 for 1951 to 102.5 for the first six months of 1952. For the same industries the weekly pay roll index for the first five months of 1952 was 130.0 compared with the 1951 value of 129.2.

The expanded rearmament program and the steel strike were the major factors affecting employment and wage structures in this period.

Canada.—The civilian labour force increased from 5,114,000 in May 1951 to 5,179,000 in May 1952, while for the same dates unemployment rose from 170,000 to 212,000. At the same time the general employment index (1939=100) rose from 175.6 at the end of May 1, 1951, to 177.5 for May 1952. The Canadian index of employment in manufacturing (1939=100) fell slightly from 189.9 in May 1951 to 188.7 in May 1952.

Great Britain.—On June 30, 1952, the total working population of Great Britain (analogous to the labour force in the United States) was 23,436,000, which represented an increase of 104,000 from the 1951 total for that date. The total working population was composed of: 22,141,000 in civil employment; 872,000 in the armed forces and women's services; 415,000 registered unemployed; and 8,000 men and women on release.

Table IV.—Analysis of Civil Employment by Industrial Groups, Great Britain

(In thousands)

Industry or service	June 30, 1952	May 31, 1952	Dec. 31, 1951
Basic industries

Source: Ministry of Labour Gazette (London).

have who had not yet taken up employment.

During the first six months of 1952, civil employment declined by 80,000. The industries which did not participate in this decline were mining, transport, agriculture, food, building and professional services. The largest declines occurred in textiles, chemicals and the distributive trades.

Australia.—The general employment index (1948=100), excluding agriculture but including forestry and fishing, was 110.6 for April 1951 and 110.1 for April 1952. Employment in manufacturing (1948=100) was 109.0 in April 1951 and 105.6 in April 1952.

France.—The general employment index (1948=100) for France (excluding agriculture) was 103.8 in April 1951, and had risen to 105.6 in April 1952. Using the same base year, the index of employment in manufacturing had a value of 105.7 in April 1951 and rose to 107.3 in April 1952.

Japan.—With 1948=100, the general employment index (excluding agriculture) was 101.2 in March 1951 and 98.5 in Feb. 1952. The index for employment in manufacturing stood at 111.7 in Dec. 1951, with July 1950=100.

Norway.—On the basis of an index including all nonagricultural employment (1948=100) the general employment index was 107.9 for June 1951 and 109.0 for June 1952. The index of employment in manufacturing (1948=100) had a value of 111.0 in June 1951 and 108.8 in June 1952.

Union of South Africa.—In April 1951 the general employment index (1948=100, and excluding agriculture and commerce) was 109.0, and for April 1952 it was 113.3. Using the same base year, the index of employment in manufacturing was 108.5 in April 1951 and 112.4 in April 1952.

West Germany.—In March 1951 the general employment index (1948=100) was 110.2, and increased to 113.6 in March 1952. The index for employment in manufacturing (1948=100) was 119.8 in March 1951 and 122.5 in March 1952. (See also BUSINESS REVIEW; CENSUS DATA, U.S.; LAW.) (P. TA.)

Endocrinology. The investigative efforts of many clinicians, biochemists, animal husbandrymen, physiologists, zoologists and others during 1952 resulted in the modification of several existing theories and the discovery of new facts.

Pituitary.—Removal, inactivation or utilization of a secreted hormone appears to be essential if it is not to accumulate in the blood in ever increasing amounts. That the liver and kidneys inactivate the sex hormones is well known. It was learned that in vitro incubation of adrenocorticotrophic hormone (ACTH) with slices or minces of liver, kidney, muscle or even adrenal resulted in inactivation of the hormone. Incubation of ACTH preparations with human blood in vitro resulted in rapid loss of endocrine activity, but beef blood lacked this effect. Investigators differed as to whether rat blood caused inactivation. Cooling the tissues or heating the blood prior to incubation largely prevented the inactivation; this suggested that a heat-labile enzyme might be involved. A "factor" in the anterior pituitary which appears to depress the respiratory quotient (carbon dioxide output divided by oxygen intake) of muscle in vitro was discovered. This factor, which is associated with, but may be distinct from, the growth hormone, seems to reduce the utilization of carbohydrate by the body.

Adrenal.—The pituitary gland, through its rate of release of ACTH, largely regulates the secretion of cortisone and other adrenal cortical hormones. In adrenal cortical hyperplasia, however, excessive amounts of androgen may still be secreted, leading to the appearance of some adult male sex characters in children and women. An ingenious clinician confirmed the possibility of successful treatment with injected cortisone of such mascu-

linized patients. The pituitary, sensitive to the excessive (secreted plus injected) blood level of cortisone, apparently reduced its secretion of ACTH. In the absence of the latter the secretion of adrenal cortical hormones, including the adrenal androgens, fell to very low levels, thus checking, if not curing, the virilism. Meanwhile the administered cortisone made up for the inadequate secretion of those cortical hormones which are not androgenic but are essential. Cessation of treatment after many months was followed by reappearance of the androgens.

Some types of prostatic and mammary cancer seem to be partially dependent for their growth on certain hormones of the adrenal gland. If the adrenals of patients with such tumours are surgically removed and the patients are supplied with one or two of the adrenal cortical hormones, conspicuous relief from symptoms may follow for several months. If patients with Addison's disease, or adrenalectomized animals, or animals whose adrenals are atrophic because their pituitary glands have been removed are not supplied with adrenal cortical hormone, one result is an abnormal sensitivity to insulin. On the other hand, if large doses of either ACTH or cortisone are given to normal animals, the other extreme is reached, and a condition resembling diabetes temporarily occurs. Adrenal cortical hormones thus appear to help to regulate the body's sensitivity to insulin, although the mechanism of such control is unknown. It also appears that, if the animal is deprived of both adrenal and pituitary hormones (by hypophysectomy), it is more sensitive to insulin than if it lacks only adrenal hormones.

Pancreas.—Insulin was added to dilute serum. Five minutes later, one-half a rat diaphragm (muscle) was bathed in the mixture. The other half was bathed in insulin only. Both halves were then transferred to glucose solutions. Later, the amount of glycogen synthesized by each piece was determined; the amount of glycogen formed in such a test is known to be proportional to the quantity of insulin available. The muscle treated with insulin alone synthesized more glycogen than did the muscle treated with insulin plus serum; part of the insulin had been inactivated by the serum. Serum from some patients inactivated insulin more effectively than serum from others. In the diabetic patient, the metabolism of fructose is essentially as in the normal person; apparently insulin is not required in the metabolism of this sugar. Glucose, on the other hand, is not metabolized normally when insulin is lacking, and diabetes results.

Gonads.—Further evidence was accumulated that progesterone, known to be produced by the corpus luteum, is secreted a few hours before ovulation occurs. The origin of the pre-ovulatory progesterone is not known; it may be produced by cells of the follicle wall. Since the administration of progesterone during the early part of the ovarian cycle results in ovulation before the usual time, it may be that normal pre-ovulatory release of progesterone is a factor in producing ovulation. While it had long been believed that the placenta is another source of progesterone, not until 1952 had biochemists succeeded in isolating the hormone from the human placenta. Sex hormones or their metabolites had several times been found in strange places; estradiol, a potent female sex hormone, was isolated from the testis.

Lactation.—Experiments with rabbits demonstrated that ejection or "let down" of milk probably occurs on a reflex basis involving successively suckling, neural stimulation of the posterior pituitary, release of a hormone (very likely pitocin) from this gland, and action of pitocin on the mammary gland. In rabbits and in sows, "let down" can be prevented or checked by the injection of epinephrine. The latter hormone is known to be secreted at moments of alarm when animals must exert themselves to meet or escape danger and when such activities as suckling must be interrupted.

England: see GREAT BRITAIN & NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature. In 1952 some adventurous speculations were made on the immediate dilemma and the future direction of the civilized world. Notable among these was Cyril Garbett's *In an Age of Revolution*. The archbishop of York put forward the Christian answer and tackled present-day problems with faith and realism in his direct and balanced inquiry. Charles Galton Darwin took an immense forward view of earth and man in *The Next Million Years*, a closely reasoned, unimpassioned treatise.

In *The Struggle for Europe*, Chester Wilmot discussed the war that was won and the peace that was lost, dwelling forcibly on the Russian policy of postwar world power as a menace to democracy. The implications of an earlier state of Russia were treated with more detachment by Edward Hallett Carr in volume III of *The Bolshevik Revolution 1917-1923*. Winston Churchill continued his war memoirs with the fifth volume, *Closing the Ring*. This took the story from June 1943 to June 1944, ending on the eve of the Normandy landings. *Beatrice Webb's Diaries, 1912-1924*, edited by Margaret I. Cole, showed the Webbs turning from the Fabian society to the developing Labour party. Politics of the last 50 years and service under five prime ministers were the theme of *Retrospect*, the memoirs of Viscount Simon, flatly written but with a special interest attaching to his work in the 1930s at the foreign office when Adolf Hitler was on the rise.

A strong light was thrown on these years from the royal angle in Harold Nicolson's masterly *King George V: His Life and Reign*. This study gave a remarkable all-round portrait of the king in pursuit of his public work. G. M. Young's *Stanley Baldwin: a Candid Study* emerged as an outspoken piece of critical portraiture in place of the expected work of official documentation.

Volume IV of *The History of the Times* was published in discreet anonymity, covering the years from 1912 to 1948—a period during which the domestic conflict between Lord Northcliffe and the office loomed so large as still to arouse discussion in retrospect. C. M. Woodhouse, studying *The Greek War of Independence*, interpreted its political and diplomatic background. Vincent T. Harlow examined with equal thoroughness a phase of Great Britain's commercial expansion in volume I of *The Founding of the Second British Empire, 1763-1793*.

Lawrence and Elisabeth Hanson presented two detailed and fully documented studies in *Necessary Evil: the Life of Jane Welsh Carlyle and Marian Evans and George Eliot*. Both were notable for richness of material, assiduously gathered and well ordered, rather than for a luminous insight into character and motive. A. B. Hopkins gave a well-balanced picture of writer and woman in *Elizabeth Gaskell: Her Life and Work*. Two women writers of a later date, both sensitive and retiring, were given the delicate treatment required. These were *Emily Dickinson* by Richard Chase and *Katherine Mansfield* by Sylvia Berkman.

Several efforts were made during the year to increase the popularity of Robert Browning. From England came Betty Miller's biographical *Robert Browning: a Portrait* and J. M. Cohen's

critical study, *Robert Browning*, with some careful interpretive argument. Rupert Hart-Davis' lively biography of *Hu Walpole* pictured a prolific and usually confident popular novelist of a type unlikely to be repeated in the present time.

The critical approach took precedence of the biographical. David Daiches' study of *Robert Burns*, largely devoted to discussion of separate poems; in Douglas Hewitt's *Conrad; a Reassessment* and in Angus Wilson's *Emile Zola*, a succinct introductory study, not without a personal viewpoint. *Norman Douglas* by R. M. Dawkins was the first critically appreciative study to appear after Douglas' death early in the year.

So far this survey has for the most part considered books which the subject leads the author. But the pulse of literature kept beating finally by those personal works of imaginative creation wherein the writer uses his material to transcend the moment, aiming toward the permanence of art. Sacheverell Sitwell voiced the artist's approach in *Cupid and the Jacaranda*, declaring "I write best when I write to please myself." In this first book of a series his imagination again travelled among flowers and music, pictures and architecture, with an added autobiographical strain. Aldous Huxley in *The Devils of Loudun* produced a grim historical account of demoniacal possession and the torture of a parish priest in 17th century France. Wyndham Lewis, more argumentative than creative, examined the present-day author's degree of freedom in society in *The Writer and the Absolute*, an essay both stimulating and controversial. Leonard Mumford's *The Conduct of Life* covered a broader field, dealing in this last volume of a sequence with "man's nature, destiny and purpose," and the path he must take for spiritual survival. John Lehmann again voiced the imaginative outlook in *The Open Night*, in which he claimed that poetry alone must create the symbols by which man lives through periods of upheaval and combats despair. *First and Last Loves* gave John Betjeman a happy chance to meditate on the architecture and habits of his chosen suburbia, and F. R. Leavis' essays, *The Common Pursuit*, displayed that author's combative outlook on writers and literature.

Among travel books, Laurens van der Post's *Venture to Interior* described journeys in Nyasaland with a blend of adventure and introspection, confidently broadening and deepening his theme. Peter Quennell's slight but beautifully written *Springs in Sicily* afforded him a Sitwellian or Huxleyan opportunity to digress without irrelevance. F. Kingdon Ward's *Plant Hunting in Manipur* and F. D. Ommanney's *The Shoals of Capricorn* were examples of technical expeditions written with a descriptive skill that gave them a general appeal.

The autobiography proper was almost attempted by August John, whose *Chiaroscuro* selected episodes at random, shedding more frequent light on fellow artists than on himself. In *Long to Learn: Chapters of an Autobiography*, John Masefield discussed the "influence that helped me to be a story teller" and the growth of his imaginative powers. From a number of military memoirs of battles, prisons and escapes, Michael Calver's *Prisoners of Hope* may be picked as a detailed personal account of guerrilla fighting behind the Japanese lines. Among memoirs and correspondence of an earlier epoch were *The Letters of Samuel Johnson*, newly edited by R. W. Chapman, and *Boswell in Holland 1763-1764*, edited by Frederick A. Pottle, less related than the previous *London Journal*, but providing some further gleams for Boswellians. (S. NN)

Fiction.—The year 1952 was a lean one for the English novel. An attachment to form and detail and a distrust of abundance were the marks of the score or so of noteworthy books that were published.

A massive exception to the rule was H. F. M. Prescott's *Man on a Donkey*. In this two-volume chronicle of the reign

Henry VIII, Miss Prescott showed herself to be that rare thing, a scholar with the common touch and with an artist's power of invention. From wilful king to restive commons, from prelate to heretic priest, there was the likeness of truth in the people she portrayed.

Among other practised authors, Evelyn Waugh was urbane and witty as ever in *Men at Arms*, the first part of a promised trilogy. If truth and fantasy both had their place in this satire of military life, it was a measure of Waugh's adroitness that the distinction was seldom clear. In *Doting*, Henry Green observed without sympathy the vagaries of middle-aged passion; a feeling for the delicate phrase was joined to a hardly less strong one for the indelicate situation. The reader was left to wonder whether the end could support such ingenuity of means. The same objection could be made in Angus Wilson's *Hemlock and After*, which found a subject in sexual aberration. In pleasanter vein, C. S. Forester continued to rescue the period novel from the tyranny of costume. His *Lieutenant Hornblower* supplied an early view of that resourceful sailor; never happier than when in action, he was here found laying siege to a fortress in Haiti, but later was left to languish on half-pay. *A Step to Silence* became the latest offering of P. H. Newby's equivocal talent: a prospect of life viewed through a glass darkly, with the disquieting inconsequence of a dream. More bizarre still, though not unpersuasive, was John C. Powys' *The Inmates*. The confessed aim of this excursion into lunacy was to find in its many forms a single attitude to life.

An interesting new talent was disclosed by Thomas Hinde's *Mr. Nicholas*. Style and a discernment beyond the author's years gave a notable authenticity to this essay in filial hate. Barbara Pym with *Excellent Women* and William Cooper with *The Struggles of Albert Woods* enlarged their earlier successes. The progress of Cooper's hero in English society was a fertile if familiar contrivance; while Miss Pym's story owed much to the engaging candour of its narrator, herself a woman of reluctant good works.

This was true also of a very different book, Joyce Cary's *Prisoner of Grace*. If the total effect of this novel was ambiguous, this was because Cary refrained, perhaps too pointedly, from imposing a pattern on his material.

In a year of public tension most novelists remained faithful to private and traditional themes. Where events did intrude, they were used to advance other ends. Two instances of this were J. D. Scott's *The Way to Glory* and Basil Davidson's *Golden Horn*. Here the Englishman abroad pursued his pleasures earnestly, haunted by the ghost of a political conscience. A light but more effective piece than either of these was James Cross' *The Eastern Gate*, in which a French colonial war was reduced to disturbingly human terms.

Short story collections in the year were few and undistinguished. William Sansom enjoyed a modest eminence with *A Touch of the Sun*, in which his talent showed itself best grounded on native soil. (J. Es.)

Poetry.—Three important collected editions appeared in 1952: *Collected Poems* by Edwin Muir, *Personae*, the collected shorter poems of Ezra Pound, and Dylan Thomas' *In Country Sleep, and Other Poems*.

Several established poets published new volumes during the year. The volumes by W. H. Auden (*Nones*) and Louis MacNeice (*Ten Burnt Offerings*) gave the impression of being somewhat transitional in character, but both contained many attractive and accomplished poems. *The Exiles* by Henry Treece and *Ways from the Village* by Gerald Bullett confirmed, rather than advanced, the reputations of their authors. In *Wrack at Tidesend*, Osbert Sitwell wrote with wit and eloquence of the provincial English scene. In *Into Hades*, an ambitious long poem by

ALDOUS HUXLEY and his wife Maria in an informal portrait. Huxley left fiction for history with the publication of *The Devils of Loudun* in 1952

Andrew Young, the author appeared to be writing in a style alien to his true talents.

Several books by younger poets appeared. *Europa and the Bull*, the second collection by W. R. Rodgers, was praised for its rich texture and striking, if somewhat superficial, command of language. *The Sailing Race* contained the best poems so far written by Patric Dickinson, while Paul Dehn's *Romantic Landscape* was an attractive collection in a lighter vein. James Kirkup published his third collection, *A Correct Compassion*. Two volumes by little-known poets were *Rod of Incantation* by novelist Francis King and *The Dark Side of Love*, a first collection by John Smith.

Two anthologies of interest appeared during the year: *Scottish Verse 1851-1951*, edited by Douglas Young, and *New Poems 1952*, edited by Roy Fuller, Montagu Slater and Clifford Dymont. The latter contained much interesting work by both established and unknown writers.

The year was also remarkable for another venture of value to poets. John Lehmann's radio anthology, *New Soundings*, was broadcast monthly on the British Broadcasting Corporation's Third Program. The first program of its kind, it proved a considerable success; prose as well as poetry was included, and in some cases the authors themselves read their contributions. Entomology and Plant Quarantine, Bureau of: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Epidemics and Public Health Services.

Poliomyelitis was epidemic in many parts of the world in 1952. In the United States the incidence rivalled that of the record year of 1949. Epidemics of paralytic poliomyelitis apparently do not affect countries with poor sanitation because there, many authorities believe, infection takes place in infancy. This infection produces active immunity but not paralysis because the infants are protected by immunity passively acquired from the mother before birth. This explanation was consistent with the recent increase in poliomyelitis and its greater concentration in adults.

Efforts to control poliomyelitis in the past were fruitless. It was possible to protect monkeys against poliomyelitis, but only limited quantities of vaccine could be prepared because the only source of the virus was the brain and cord of experimentally infected monkeys or mice. Furthermore, the use of such vaccine was not considered safe. Now all three of the recognized types of poliomyelitis virus can be grown in the test tube on tissue culture. Thus, one may begin legitimately to think of vaccine for the active immunization of humans. However, infection with poliomyelitis virus results in paralysis in only one child out of 100, and there is no way to anticipate which child will succumb; thus, vaccination must be given to all. It is obvious that any vaccine developed must not only be effective but it must, above all, be safe. By 1952, the effectiveness and safety were yet to be proven, and whether vaccination would prove practicable was not yet known.

Another possible preventive measure was tested in 1951. Gamma globulin, the fraction of human blood which contains substances protecting against infectious diseases, was given to a large proportion of the children in Provo, Utah, during an epidemic. A similar number of children received a harmless substitute and served as controls. The hope was that the gamma globulin would prevent paralysis in children infected with the poliomyelitis virus. The protection afforded by gamma globulin would disappear in a few weeks, but at the same time the children might be producing their own antibodies and thus attain long-lasting immunity. The results of the trial in Utah were inconclusive and further trials became necessary. The experiment was therefore repeated on a larger scale in 1952 in Houston, Tex., and in Sioux City, Ia., both sites of severe epidemics. The results had not yet been evaluated. It remained to be seen whether this is a practical method, even though it may result in protection. The only source of gamma globulin is human blood. The supply was limited and gamma globulin was in great demand for the prevention of measles and certain other infections.

During the winter of 1951-52, influenza B was widely epidemic in various parts of the globe for the first time since 1946. It was a mild disease for the most part, although there were deaths in the aged and debilitated. The World Influenza centre gave valuable service by reporting the progress of influenza waves and the nature of the viruses isolated by the co-operating laboratories.

In the United States, rapid investigation and reporting of outbreaks to the National Office of Vital Statistics was made more effective. The list of diseases reportable to the federal government was revised in the light of existing knowledge. The United States government and many of the states relaxed the rigorous control of psittacine birds which had been in force since the widespread outbreaks of "parrot fever" in 1929-30. It was now known that psittacosis exists in many native birds, wild and domestic thus making it unrealistic to apply strict con-

trol to the relatively small psittacine bird reservoir. Furthermore, human infections are few and respond well to antibiotic therapy.

A severe epidemic of meningococcal meningitis had been in progress in parts of Africa since 1949, and during 1952 the problem was particularly acute. The Anglo-Egyptian Sudan, Nigeria and Eritrea bore the brunt. In the United States, the disease characteristically occurs in epidemic fashion every eight years. Since the last episode occurred in 1943, it was not unexpected that meningococcal meningitis was reported more frequently during 1952, and it could be predicted that the disease might occur more widely in 1953. This disease is not so terrifying as it once was since the sulfa drugs and antibiotics are effective in treatment. Moreover, mass prophylactic use in small population groups can control epidemics.

Streptococcal infections had been decreasing in virulence for some decades, and apparently had also decreased in number. However, in the United States a rise was noted in 1951, and a further rise in 1952. This might represent merely a temporary check in the decline or might portend a more significant change in the natural history of the disease. However, penicillin provides a ready cure.

Infectious encephalitis also continued to be reported in greater numbers in the United States. This is not a single entity but is a heterogeneous group of specific encephalitis viruses, infections and other illnesses of noninfectious nature. A sharp outbreak of western equine encephalitis totalling 630 cases and many deaths in California was reported during the summer of 1952. A vast control program designed to reduce the population of the mosquito, *Culex tarsalis*, the natural vector of the disease, was carried out. There were preliminary indications that this was an effective barrier to spread of the epidemic. Unfortunately, no specific therapy exists and it is not possible to eradicate the reservoir of infection existing in the wild and domestic bird population.

The phenomenal decline of diphtheria and whooping cough in Great Britain, the United States and elsewhere continued. The value of diphtheria immunization was well proved. Immunization against whooping cough was of more recent origin but was also of known value. Its contribution to the downfall of whooping cough was further proved by the Medical Research Council in Great Britain. They showed that immunization reduced the likelihood of whooping cough by 78%. The cases that occurred in the immunized were, on the whole, less severe and shorter lasting.

The five internationally quarantinable diseases varied little in scope or locale. A start was made in the control of epidemic typhus in parts of Afghanistan by destroying the louse vector by DDT, a method which proved so effective in Italy in World War II. Cholera was now confined to Asia. In general, the situation had improved, although there was no intelligence from China.

An outbreak of mild smallpox consisting of 132 cases and deaths occurred in Lancashire, Eng. In Marseilles, Fr., the return of an infected soldier from Indochina caused 33 cases of whom 4 died. The extent of these outbreaks was the result of the low level of smallpox vaccination in the community.

"Jungle" yellow fever continued to push its way slowly northward through Central America, and had reached Nicaragua. This "Jungle" or sylvan type is a disease of monkeys which is transmitted to near-by humans by jungle mosquitoes. "Jungle" yellow fever also broke out in Brazil in settlements made from newly cleared forest lands. Obviously the monkey reservoir cannot be destroyed nor can one eliminate mosquitoes from the jungle. However, humans can be protected completely by yellow fever vaccine, and millions had been so protected. This had reduced deaths to a low figure. The mosquito which transmits yellow

SPECTING CARGO HOLD of a Norwegian freighter fumigated at U.S. government expense. When dead rats are found aboard incoming vessels after fumigation they are taken to a quarantine station to be examined for plague symptoms

ver in nonforest areas had been practically eliminated from South America.

Human plague is a problem largely confined to India, although it had been decreasing remarkably there. China and North Korea were unknown quantities. A small number of human cases occurred in remote areas of Africa and South America in association with solidly established infections of wild rodents. Although the animal reservoir could not be eliminated, settled areas were being freed of the disease and rat control had prevented its transfer by ships.

It was hoped that the remarkable advances made in the control of enteric diseases by good sanitation and of diseases such as whooping cough, diphtheria and smallpox by immunization could be paralleled in the historic plagues of the world. Chemicals to destroy the insect vectors, vaccines, drugs to prevent or cure, all of these had made inroads on scourges hitherto accepted as inevitable. Syphilis, yaws and bejel, long rooted in some peoples, were beginning to give way to the mass use of penicillin. The tools were at hand but they had to be used. Apparently they were not being used effectively in China and North Korea, where the widespread ravages of disease were falsely attributed to the employment of biological warfare by the United Nations. There were gaps in the defenses, of which poliomyelitis was one instance. Epidemic haemorrhagic fever, a disease known to the Japanese troops in Manchuria in 1939 and afflicting United Nations forces in Korea, was another. There was no effective treatment for this disease but the possibility that there was a rodent reservoir and an arthropod transmitter gave hope that methods developed for other diseases with a similar natural history would prove successful in the control of this. (See also **FEDERAL SECURITY AGENCY; INDUSTRIAL HEALTH**; and articles on specific diseases.) (H. E. H.)

Episcopal Church: see **PROTESTANT EPISCOPAL CHURCH.**

Eritrea. A former Italian colony on the Red sea bounded south by Ethiopia and west by Sudan, Eritrea was from 1941 under temporary British administration and from Sept. 15, 1952, an autonomous province federated with Ethiopia. Area: 47,875 sq.mi. Pop. (1950 est.): 1,100,300 including 18,000

Italians. Language: mainly Tigrinya and Tigré. Religion: c. 50% Christian Monophysite and 50% Moslem. Capital, Asmara (pop. c. 117,000). Representative of the emperor of Ethiopia: Bitwoded Andargai Masai. Chief executive, elected by the Eritrean representative assembly: Ato Tedla Bairu.

History.—In 1952 Eritrea achieved its new status of an "autonomous unit federated with Ethiopia under the sovereignty of the Ethiopian crown" prescribed by the U.N. resolution of 1950. The arrangements which began in 1951 moved swiftly and smoothly during 1952 to their conclusion. The deadline for their achievement had been set for Sept. 15 and on that date the federation became fully effective and the new Eritrean government assumed the powers provided for it in its constitution. This had been prepared by the U.N. commissioner, Eduardo Anze Matienzo (Bolivia), was adopted by an elected Eritrean assembly on July 10 and ratified by the emperor of Ethiopia on Aug. 11. The federal act which set up the federation was written into the U.N. resolution and was ratified by the emperor on Sept. 11. Federation was then effective, and by Sept. 15 physical transfer of powers and authority to the successor authorities by the British administration was complete.

The Eritrean government assumed authority in all domestic affairs and the federal government, which was in effect the Ethiopian government, took over control of those affairs which had been broadly defined in the resolution as federal responsibilities. On Sept. 16 the British authorities who had governed Eritrea since April 1941 finally withdrew, and the British flag was hauled down and replaced by the flag of the federation, the Ethiopian flag and the new blue flag of Eritrea. A handful of British advisers and Italian technicians remained to assist the new regime.

Thus Eritrea became incorporated as a specially privileged and self-governing unit in the Ethiopian empire, from which it had been detached about 60 years earlier to become an Italian colony. Its fate had been in the balance for 11½ years.

The population is evenly divided between plateau Christians and lowland Moslems and this fact was recognized in a parity of these two components in the composition of the assembly and posts in the new government. The head of the latter was a Christian. The whole process was conducted in an atmosphere of good will in both Eritrea and Ethiopia which augured well for the new relationship.

In October Emperor Haile Selassie paid a state visit to all the provinces of Eritrea and was greeted with enthusiasm by his new subjects wherever he went. He made it clear to them that his sole desire was to ensure their peace and prosperity.

The successful implementation of the Eritrean settlement was reported to the general assembly of the United Nations at the end of 1952 and general approval of the action taken was recorded. Eritrea, from being an international "problem," found its haven as part of the Ethiopian empire. (F. E. St.)

Finance.—Budget: (1951-52 actual) revenue £3,019,475; expenditure £3,269,795; (1952-53 est., first year of the new status) revenue £1,639,005; expenditure £1,566,644.

Foreign Trade.—(1951) Exports £5,014,056; imports £5,849,042.

Estonia. From Feb. 24, 1918, to Aug. 6, 1940, when it was annexed by the U.S.S.R., Estonia, one of the Baltic states of northeastern Europe, was an independent republic. Area: 18,357 sq.mi. Pop.: (1939 est.) 1,134,000; (1950 est.) 1,200,000. Language: Estonian and Russian. Religion: Lutheran and Greek Orthodox. Chief towns (pop., 1939 est.): Tallinn (cap., 146,400); Tartu (60,100); Kohtla-Järve (1950 est., 30,000). Chairman of the presidium of the supreme soviet in 1952, August M. Jakobson; chairman of the council of ministers, Aleksey Muurisepp.

History.—On Feb. 24, 1952, Estonia's national day, Konstan-

tin Päts, the last president of independent Estonia, Gen. Jaan Laidoner, commander in chief, and other Estonian leaders who were deported in June 1940 and whose fate was unknown were attacked in a broadcast from Tallinn denouncing them as traitors and "obedient tools of the western imperialists." An exhibition entitled "Anglo-America Intervention in Estonia, 1918-20" was opened at Tallinn to suggest that the Estonian war of independence was fought to make the country an Anglo-American colony. On May 15 the town of Kuressaare on the island of Saaremaa (Oesel) was renamed Kingissepp in honour of an Estonian Communist rebel, Victor Kingissepp, who had been executed for high treason in 1923.

On May 10 the presidium of the supreme soviet of the U.S.S.R. confirmed the new administrative reform grouping the 39 *rayony* or districts into three *oblasti* or provinces with capitals at Tallinn, Parnu and Tartu. At the plenary session of the central committee of the Estonian Communist party at Tallinn, on March 26-28, Ivan Gustavovich Kabin, first secretary, demanded that the workers and peasants should increase their socialist consciousness and political vigilance and that the nefarious activities of hostile elements should be unmasked. These elements among others were squandering and robbing the socialist property of the collective farms. He revealed that the number of *kolkhozy* was reduced from 2,975 in 1949 to 1,137. Only 163 *kolkhozy* had a primary Communist organization; i.e., at least three party members. The total party membership amounted to 31,000.

According to the fifth five-year plan, 1951-55, Estonia was to develop its oil-shale industry. The production of gas from shale was to increase by 120% and a gas pipe line was to be laid from Kohtla-Järve to Tallinn. The production of liquid fuel from the same source was to be increased by 80%. It was estimated that in 1950 oil production was about 450,000 metric tons. A large hydroelectric power station on the Narva river was to be completed. The railway system was to be overhauled and, it was believed, the Tallinn-Krasnogvardeisk line was to be provided with a second track. Since 1945 the Estonian coast and islands had been covered with a network of fortifications. There were also about 60 airfields.

Jaan Kiivit, the soviet-appointed archbishop of the Estonian Lutheran Church, took part in a "Defense of Peace" conference organized in May at Zagorsk, near Moscow, by Alexei, the patriarch of Moscow and all Russia. (See also LATVIA; LITHUANIA.)

Education.—Schools (1950): elementary 1,148, pupils 142,500; secondary, pupils 13,500; technical, pupils 14,000; institutions of higher education 6, students 6,500, including Tartu university, students 2,700.

Finance.—Budget (1952 est.): balanced at 1,039,280,000 roubles.

Etching. In 1952 the tendencies most evident in the countries where etching was widely practised as a medium of creative graphic expression were: (1) the use of colour in place of the traditional monochromatic black, (2) a predilection for the large plate, (3) the employment of mixed graphic media to achieve textural effects and to furnish the basis for colour printing, and (4) the apparent desire on the part of certain artists who had adopted the more extreme phases of the so-called modern school to break through the narrow spiritual limitations of these and revert to richer and more expressive forms.

England, France and the United States continued to be the three centres of greatest activity in the field of etching. England, stronghold of conservatism, was less affected by the modern influence than any other country, and its etchers, with few exceptions, continued to work in the great tradition of the art. W. D. Brokman-Davis, Hubert Andrew Freeth, Robert Spence,

Sara Sproule and the veterans, Paul Drury and W. P. Robins produced significant work in 1952, while the dry points of Sir Muirhead Bone remained among the greatest examples of the medium. The same year marked the death of the distinguished etcher and dry pointer Martin Hardie.

The golden age of French etching, the 19th century, carried over into the 20th, but comparatively few French etchers in 1952 worked in the pure medium. The trend was rather toward the employment of mixed media, the engraved in place of the bitten line, the use of colour and the large plate, and the emphasis on book illustration. With their great sensitivity, imaginative powers and technical skill, the French had always been leaders in linear design, and since the modern movement owed to France so much of its impetus, it was natural that the great majority of French graphic artists adopted that idiom. The recognized leaders among them, Raoul Dufy, Henri Matisse, Pablo Picasso, Georges Rouault and Jacques Villon, all worked in etching to some extent. Among a host of others, employing a graphic media, all approaches and all techniques, Michel Ciri, Albert Decaris, Edouard Georg, André Jacquemin, Robert Lotron, Louis Joseph Soulas and Roger Vieillard did outstanding work.

The greatest strength of the American school lay in its freshness, vitality, variety of approach and innate creative power. Its greatest weakness was in the neglect of essential spiritual values in the preoccupation with technical methods and purely pictorial effects. With the blend of racial influences affecting the character and outlook of the American artist, and the unlimited sources of inspiration presented to him, it was natural that these should be reflected in his work. Particularly evident was the trend away from pure linear etching to the mixture of media to produce tonal effects and provide a basis for colour. Many artists who had adopted the modern idiom clung steadfastly to its abstract and nonobjective terms, but others, having reduced these terms to academic formulas susceptible only to repetition, appeared to be seeking more objective means for expressing subjective feeling. Those who employed etching either entirely or with other media used supplementarily, included, among a few: Peggy Bacon, Minna Citron, Stephen Csok, Ernest Freed, Sue Fuller, Arthur William Heintzelman, Gen Kloss, Mauricio Lasansky, Helen A. Loggie, Luigi Lucioni, Carl Max Schultheiss and the veterans, John Edward Costigan, Eugene Higgins, Roi Partridge, Ernest D. Roth and Hermon Armour Webster, the last named long resident in France.

Celestino Celestini, Benevenuto Disertori, Valerio Frasccheri and Antonio Music worked in etching, although the majority of Italian printmakers occupied themselves with the sister arts of wood engraving and lithography. As in all Latin countries, the modern influence predominated.

Etching in Germany was still involved in the social, economic and political disorder existing in that country, which had seen the birth of the art in the 16th century.

Belgium, the Netherlands, Switzerland and the Scandinavian countries were active in the field of etching in 1952, but in those countries, too, the struggle between forms of expression and the general social and political uncertainty and unrest operated against stability.

The printmakers of Mexico and the South American countries for the most part concentrated their efforts on lithography, while those of China and Japan were more concerned with reviving the great schools of woodcutting that were their glory of the past. Canada and Hungary, among the smaller national centres of etching, maintained flourishing and vital schools, the former including such outstanding names as Sybil Andre, John J. Barry and the veteran Nicholas Hornyansky, and the latter, Julius Komjáti and Nandor Varga. (J. T. AR.)

Ethiopia. An independent empire of northeastern Africa, Ethiopia is bounded north and west by the Anglo-Egyptian Sudan, south by Kenya, southeast by Italian Somaliland and east by British and French Somaliland. Area (excluding Eritrea): c. 350,000 sq.mi. Pop. (no census ever taken, 1951 est.): 10,000,000. Language: Amharic, the official language; also Tigrinya, Tigré, Galla, Somali, etc. Religion: Christian Monophysite (in communion with the Egyptian Coptic Church) 57%; Moslem 17%; pagan, etc., 26%. Chief towns: Addis Ababa (cap., 250,000); Harar (45,000); Dessie (35,000); Dire Dawa (30,000). Ruler: Emperor Haile Selassie I; prime minister in 1952: Bitwoded Makonnen Endalkatchou.

History.—The event of outstanding importance in 1952 was the final settlement of the Eritrean question by the incorporation of that country into the Ethiopian empire on a federation basis under the sovereignty of the Ethiopian crown. On July 10 the Eritrean constituent assembly approved a constitution which had been prepared by the U.N. commissioner after consultation with the British administration, the Ethiopian government and the Eritrean people. This constitution was ratified by Emperor Haile Selassie on Aug. 11 and on Sept. 11. The emperor also ratified a federation act which had been drawn up and approved by the U.N. assembly on Dec. 2, 1950, thus completing the formalities that were the necessary prelude to the transfer of control from the caretaker British administration on Sept. 15. The representative of the emperor, his son-in-law Bitwoded Andargai Masai, arrived in Asmara on Sept. 13 with his wife Princess Tenegn Work, and was installed in the palace of the former Italian governor. The emperor paid an official visit to the newly acquired territory in October.

Eritrea secured representation in the Ethiopian parliament on the basis of population; 3 Eritrean senators being appointed directly by the emperor and 5 deputies being elected by the Eritrean constituent assembly from among its own number. The Eritrean assembly consisted of 64 members, half Christians and half Moslems. Its first president was Ali Radai, a Moslem. Laws passed by the assembly were promulgated under the signature of the emperor's representative, who had the power of veto in respect of legislation which impinged on subjects reserved to the imperial government. These were defense, foreign affairs, currency and finance, foreign and interstate commerce and external and interstate communications, including ports.

The actual administration of Eritrea would be in the hands of a chief executive, elected by the Eritrean assembly but independent of it. He would appoint four secretaries of departments responsible to himself. The first chief executive was a Christian, Ato Tedla Bairu. (See also ERITREA.)

The increasing interest taken by the U.S. government in the well-being of Ethiopia received outstanding proof with the signing of a general Point Four agreement on June 16, 1951, for the development of agricultural education and research. In June 1952 a Point Four director was installed in Addis Ababa, and preliminary discussions crystallized into an agreement for the establishment of an agricultural college. For this purpose a sum of Eth. \$2,000,000 was made immediately available, half (or U.S. \$400,000) being provided from Point Four resources and half by the Ethiopian government. Other projects included the opening of two agricultural secondary schools in the provinces and the establishment of several research stations to be closely integrated with the above college and schools.

Since its foundation in Aug. 1942 the grand total of assets of the state bank had grown from Eth. \$12,000,000 to Eth. \$176,200,000; of deposits and loans from Eth. \$11,000,000 and Eth. \$1,000,000 in 1943 to Eth. \$45,300,000 and Eth. \$21,000,000, respectively, at the end of 1951. By the end of 1951 the issue department of the bank had issued notes under the new

monetary system to the extent of Eth. \$75,561,999, cover being held at that date in the shape of gold, silver and foreign exchange and securities to the amount of 55%.

Education.—Schools (1950-51): elementary 538, pupils 55,000, teachers 1,755 (including 201 foreign); secondary (1949-50) 6, pupils 1,204. There were 220 students abroad, mostly supported by the government.

Finance and Banking.—Budget (1949-50): revenue Eth. \$105,866,000, expenditure Eth. \$90,430,000. Monetary unit: Ethiopian dollar. Exchange rate: Eth. \$7 to the pound sterling, and Eth. \$2.50 to the U.S. dollar.

Foreign Trade.—(1949-50) Imports Eth. \$74,600,000, exports Eth. \$68,300,000; (1950-51) imports Eth. \$95,300,000, exports Eth. \$111,700,000. Main sources of imports: India 25%; U.K. 13%; U.S. 12%; Italy 9%. Main destinations of exports: Aden 25%; Eritrea 19%; U.S. 13%; French Somaliland 11%. Main imports: cotton piece goods, machinery, sugar and salt. Main exports (1950-51): coffee 50%; hides 18%; cereals and pulses 10%; oilseeds 10%.

Transport and Communications.—Roads 44,000 mi., of which 9,000 mi. were suitable for motor traffic. Licensed motor vehicles (Dec. 1950): cars 2,500, commercial 1,750. Railways: 487 mi. Air transport (Ethiopian Air Lines, 1951): passengers carried 36,795; passenger-miles 16,099,506; freight ton-miles 1,132,293.

Agriculture.—Coffee production: (1949) 36,500 metric tons, (1950) 31,200 metric tons. Livestock (Sept. 1951): cattle 18,000,000; goats and sheep 20,000,000; camels 9,000,000; chickens 10,000,000; horses and mules 3,000,000.

European Union. The unification of Europe made more significant progress in 1952 than in any preceding year. The emphasis shifted from the Council of Europe, created by a multilateral treaty signed in 1949, and to which by the end of 1951 most European states outside the soviet orbit belonged, to the closer integration of "little Europe," the growing federation of France, Germany, Italy, Belgium, Luxembourg and the Netherlands. The fundamental progress of European unification in 1952 consisted in the elaboration of closer ties among these six nations. It proceeded on two different lines, in building up a community of heavy industry (the Schuman plan for merging coal and steel production) and of defense (the European Defense Community treaty for the creation of a common army). Of these two plans, the Schuman plan was in the stage of realization at the end of 1952, while the European army plan was still in the discussion stage. For the first time, however, it was clearly and officially envisaged, that these two partial and functional organizations should be stepping stones toward the creation of a more inclusive political and economic federation. At the beginning of 1952, the foreign ministers of the six countries negotiating for a European army agreed in principle to the drafting of proposals for a European parliament. Accordingly the European Defense Community treaty, signed on May 27, 1952, provided in article 38 that within six months of the establishment of its assembly, it must prepare recommendations on "the constitution of a European Community Assembly elected on a democratic basis; the powers to be granted to such an Assembly; the changes that should eventually be made in the E.D.C. (European Defense Community) Treaty in order, among other things, to safe-guard adequate representation for the member States." Article 38 further instructed the assembly to "be guided in its work by the following principles: the final organization which is to replace the present provisional one shall be conceived in such a way as to constitute one of the parts of an eventual federal or confederal structure founded on the principles of the separation of powers and comprising a bi-cameral system of representation."

As it became clear, however, that the ratification of the

E.D.C. might take time, it was decided in the fall of 1952 to entrust the elaboration of the federal structure to the assembly of the new steel and coal community. The 50-year treaty for merging the 231,000,000-ton coal resources and 37,000,000-ton steel capacity of the six nations into a single market of 157,000,000 people, customs free regarding these commodities, came into force in June 1952 after all the parliaments of the six nations involved had ratified it. The most important of these decisions were those by the French national assembly, which ratified the treaty constituting the European Coal and Steel Community (E.C.S.C.) on Dec. 13, 1951, by a majority of 377 against 233 votes, and by the Federal German parliament, which voted on Jan. 11, 1952, to ratify the plan by 232 to 143 votes. The E.C.S.C. was open to all the countries that wished to participate in it. The national production of coal and steel would henceforth come under the direct jurisdiction of the new common institutions created by the treaty. They were:

1. The High Authority which is the executive power of the community and to which is attached a consultative committee composed of representatives of producers, consumers and workers.
2. The Council of Ministers, composed of six members, one for each participating state, which maintains the necessary liaison between the powers of the High Authority and those retained by each government. With respect to the voting procedure of the council, the production of each state in relation to that of the common market is taken into account, so that the council cannot be dominated by a coalition, either of the two principal producers (France and Germany) or of the others.
3. The Assembly, appointed by the various national parliaments or elected by direct suffrage, exercises democratic control over the High Authority and may by a vote of nonconfidence adopted by two-thirds of the members voting cause its resignation.
4. The Court of Justice, composed of seven judges appointed for six years by agreement among the governments, functions to hear appeals by member states against the decisions of the High Authority.

Thus the first step was taken successfully in the solution of an entirely new problem of an extraordinary scope, to bring sovereign states which had been completely independent for centuries willingly to abandon a fraction of their sovereign independence. The six nations quickly agreed in July on the first concrete measures to put the E.C.S.C. into immediate operation. It was decided that the High Authority and the court would sit in Luxembourg and the assembly in Strasbourg. The choice of a permanent capital was made contingent on a Franco-German agreement on the Saar. The High Authority met in Luxembourg on Aug. 10 under the chairmanship of Jean Monnet. With the creation of the High Authority all the restrictions imposed by the Allies on west German steel production were lifted and first steps taken to liquidate the International Authority for the Ruhr, created on April 28, 1949, as a security measure against German military and economic hegemony in Europe.

The High Authority consisted of nine members, two each from France, Germany and Belgium, and one each from Italy, Luxembourg and the Netherlands. Besides the chairman, there were two vice-chairmen, a German and a Belgian. An Italian, Massimo Piloti, was named president of the Court of Justice. In September the Council of Ministers met for the first time and German Chancellor Konrad Adenauer functioned as its first chairman. The council decided unanimously to have the assembly work out a draft treaty establishing a European federal community.

The assembly met in Strasbourg on Sept. 11. The large majority of its 78 members clearly demonstrated their intention to move rapidly toward the goal of a political federation. Paul-Henri Spaak, a Belgium Socialist and an ardent supporter of federation, was elected president by 38 votes to 30 for Heinrich von Brentano, a German Christian Democrat. The election followed party rather than national lines. Brentano was made president of the 26-man committee to draft the federal treaty, which was asked to complete the job by March 10, 1953. The assembly also approved a proposal to add three additional delegates each from France, Germany and Italy. One of the questions debated was the establishment of a closer relationship between the

"HERE, FIDO!" a 1952 cartoon by White of the Akron Beacon-Journal

E.C.S.C. and nonmember nations, especially Great Britain and the United States. Both nations agreed to establish representation at the High Authority. Coal shipped from the United States to any of the six member nations would be contributed so as to aid whatever allocations the High Authority might make within the six-country area. The United States would act to recognize and re-enforce such sovereign powers as the High Authority possessed. A similar attitude was taken by Great Britain; thus the E.C.S.C. would be assisted by the political and financial backing of the United States and the co-operation of Great Britain, functioning as a part of the Atlantic community rather than as a purely continental group of nations.

One of the problems faced by the E.C.S.C. was the co-ordination of its work with the Council of Europe, in which 14 European nations were represented. Its Consultative assembly, consisting of 132 members elected by the parliaments of the member states, met in Strasbourg in Sept. 1952 and adopted a proposal, made by British foreign secretary Anthony Eden, for establishing close organic links between the E.C.S.C. and the nonparticipating members of the Council of Europe. According to these proposals, Great Britain, the Scandinavian countries, Ireland, Iceland, Greece and Turkey could send observers to the meetings of the assembly and of the ministerial organs of the E.C.S.C. with the right to speak but not to vote. It was generally recognized in Great Britain and France, that the close co-operation of Britain with the developing federal structure of "little Europe" would allay many French fears of a possible German domination of the new structure. One additional stumbling block in the realization of the federal plans was the German-French controversy about the future of the Saar territory.

The Consultative assembly of the Council of Europe approved on Sept. 25 a plan to pool the resources of its members for the development of dependent areas and to create a new vast trad-

ing area embracing the British Commonwealth and the nations of western Europe and their overseas territories. The plan would also enable Germany to help create new sources of raw material in the economically backward areas and raise living conditions there. By such a close economic union, Europe might become self-supporting. The plan foresaw the setting up of a European bank for the development of overseas territories; long-term international contracts on basic products; and a system of preferential tariffs between Great Britain and the commonwealth countries on the one hand and the other European nations on the other hand. Other proposals for the integration of Europe which gained almost universal adherence were a plan for the co-ordination of the highway, rail and canal networks of western Europe, and a health pool in which doctors, laboratories and medicines would be joined in a common fight against disease. A European Transport council was suggested to lay down priorities on future transportation developments and to take the lead in fitting existing systems together by pooling and standardizing equipment, by creating joint installations and by establishing the most economical routes and freight rates. The Consultative assembly also demanded the establishment of a European credit fund to finance housing projects in bombed-out and overcrowded regions as a special help to war victims and refugees. A proposal for the establishment of a committee for the co-ordination of social security legislations, leading to an eventual common system, was also unanimously approved by the Consultative assembly. A French suggestion for an agricultural pool for putting the wine, grain, milk and vegetables of the continent into a near-common market was still in the discussion stage. All these plans showed the new effervescence of the ideal of union and federation growing in Europe to a degree hardly foreseen by any observer a few years before. It was also of great importance that the practical steps taken tended to bridge the gulf between the "federalist" approach suggested by the continental countries and the "functional" approach favoured by Great Britain and the Scandinavian nations.

Meanwhile the six nations forming the E.C.S.C. proceeded with closer plans for pooling their economic resources. On Sept. 11 Pres. Luigi Einaudi of Italy opened in Genoa a conference of 100 experts from the six nations to study plans for the co-operative economy of a federated Europe, especially a unified monetary system, a unified tax system, and mobility of labour across the existing national frontiers. The six nations of the E.C.S.C. asked on Oct. 7 for the necessary legal authority from the General Agreement on Tariffs and Trade to establish a practically free trade area including the six nations. To that end, the six nations would be relieved of their obligations to extend to members of the General Agreement on Tariffs and Trade all tariff concessions granted to one another. They would undertake to establish a common tariff on iron and steel products that would apply to all six countries in their dealings with nonmembers of the E.C.S.C., and also would undertake to make this common tariff considerably lower than the existing tariffs of France, Germany and Italy.

Perhaps the most difficult step toward European union was taken in the plans for the creation of a European Defense Community (E.D.C.). After 15 months of negotiations, a draft treaty to create a common integrated defense force of France, Germany, Italy, Belgium, the Netherlands and Luxembourg under the North Atlantic Treaty command was initialed in Paris on May 9, 1952. Its purpose was twofold: to allow the rearmament of Germany in view of the potential threat of the U.S.S.R. to western Europe, and to allay the fear of France and other European nations of the threat of German domination. The six nations represented were the same as those united in the E.C.S.C., but the E.D.C. was much more closely integrated

with the Atlantic community than was the E.C.S.C. The forces of the E.D.C. would be closely integrated under a centralized administration with a common procurement system and would maintain the closest possible liaison with British and other North Atlantic Treaty forces. Great Britain gave the E.D.C. a guarantee that any attack on the E.D.C. would automatically bring Great Britain into the war. France demanded a similar guarantee from the United States and above all precise guarantees by Great Britain and the United States against any future withdrawal of Germany and German armed forces from the E.D.C.

With the ratification of the E.D.C. treaty by the six nations, the full sovereignty of Germany would be restored. The treaty foresaw the creation of a total of 43 combat groups, of which 12 would be German, and of a tactical air force of 5,200 planes, including 1,350 German planes. The total German manpower contribution was fixed at 409,000, of whom there would be 156,000 in the ground forces, 156,000 in service and supply forces, 85,000 in the air force and 12,000 in the navy, which would be limited to vessels of 1,500 tons or less. This new European army would have a solely defensive role. The member nations pledged themselves to build their military strength without retarding social progress. The organs of the E.D.C. would consist of a council, an assembly and a commissariat. The council, formed by one ministerial representative from each of the six nations and with the chairmanship rotating among them, must approve the appointments of the higher officers. The commissariat would prepare and carry out the organizational plans for the army and would decide upon a common defense budget, a program for a common armament production, and common mobilization plans. The army would include both draftees, whose active service period was intended to be 18 months, and volunteers who would sign up for longer periods of service. Special European army schools were to be organized to train officers for this new integrated army.

After ratification of the E.D.C. agreements and of the peace contract between Germany and the Allies, the Allied control on the German production of heavy and light weapons would be lifted. The E.D.C. agreement provided that production of armaments for its forces, of which Germany would be a member, must be licensed by the E.D.C. commissariat and that orders for the production of certain weapons would not, in general, be given to plants located in strategically exposed areas, such as the Ruhr and the Rhineland. The German government, while allowed to engage in nonmilitary atomic research, pledged not to manufacture atomic, chemical and biological weapons, guided missiles, naval vessels and military air craft, on the condition that German troop contingents would be supplied with these weapons on as favourable a basis as other contingents of the E.D.C.

Thus the foundations were laid for the creation of the first European army in history, based upon the voluntary co-operation of the contributing members. This army was clearly envisaged as a part of the North Atlantic Treaty forces and was thus an important step toward the integration of Germany, France, Italy and the Low Countries into the Atlantic union. Yet at the end of Oct. 1952 the nationalist fears and hopes of the various European nations, especially in France and Germany, were still strong enough to make ratification of the E.D.C. agreements by the various parliaments doubtful. The memories of bitter conflicts in the past still bred a distrust, which the leading statesmen of the nations involved tried hard to overcome. There was also the danger that certain circles in Germany and France, and to a lesser degree in the other countries, would use the plans and slogans of European union for the furtherance of nationalist purposes. In spite of these diffi-

culties, the future of European unity, within a wide Atlantic union, looked brighter at the end of 1952 than in any other period of history. (See also MUTUAL SECURITY PROGRAM; NORTH ATLANTIC TREATY ORGANIZATION).

Events of the Year: see CALENDAR OF EVENTS, 1952, pages I-16.

Exchange Control and Exchange Rates.

The rise in raw material prices following the outbreak of war in Korea had caused the terms of trade of most industrial countries to deteriorate. This, together with the impact of rising rearmament expenditures, had weakened the international economic position of various European countries. As a result, the currencies of raw material producing areas had generally been relatively strong in 1951 and some countries had relaxed their exchange controls. At the same time there had been a tendency toward more strict exchange controls in Europe.

In 1952 these movements showed signs of reversing themselves. Most raw material prices fell, but inflationary conditions—which had sometimes been stimulated by the 1950-51 boom—persisted in certain raw material producing countries. On the other hand, the terms of trade of most industrial countries improved, and their balance of payments deficits were reduced as the restrictions they had imposed on imports began to take effect. Therefore 1952 saw some currency depreciations, or tighter exchange controls, or both, in various raw material producing countries. In industrial countries, on the other hand, there were very few rate changes. In a few instances exchange controls were eased, but on the whole the strain on available resources imposed by rearmament continued so that these relaxations were neither numerous nor far-reaching.

United States.—In the course of 1951 the United States balance of payments position had grown stronger, a net gold and dollar loss of \$89,000,000 in the first quarter of the year having given place to a net gain of \$325,000,000 in the last quarter. The movement in reserves, however, probably exaggerated the change in the country's international economic position, since imports were seasonally high and were also influenced by inventory building abroad while there was a lag in the outflow of foreign aid pending the passage of new legislation.

The international economic position of the U.S. remained strong in 1952, and the U.S. dollar was still at a premium in most free markets of the world, with the notable exception of Canada. As the months passed, measures were taken both in the U.S. and abroad to alleviate the disequilibrium which was reflected in the inflow of gold. The current account surplus was reduced mainly because the European coal situation improved, the restocking movement ran its course and the import restrictions which were imposed in some countries to stem the outflow of gold and dollar reserves began to take effect. Furthermore, the amount of U.S. government aid began to increase again, with a rising proportion being devoted to the support of the defense efforts of western Europe. In the first quarter of 1952 the U.S. surplus on current account (goods and services) amounted to \$1,400,000,000 compared with \$1,900,000,000 in the last quarter of 1951. In the spring the U.S. gold reserve continued to rise, but through the summer months it remained

virtually stationary at about \$23,500,000,000. Foreign dollar balances, on the other hand, rose steadily and at the end of July were about \$1,000,000,000 higher than they had been at the end of 1951.

Canada.—Mainly as a result of its improving trade position and the continued inflow of capital from the United States the Canadian dollar had appreciated gradually in the latter half of 1951, and on Dec. 14 the Canadian monetary authorities had abolished all exchange controls. By the middle of Jan. 1952 the Canadian dollar was at par with the U.S. dollar. Influenced by heavy London buying and also by seasonal factors such as the beginning of the tourist season, it touched U.S. \$1.04 at the beginning of July. Thereafter, the premium dropped back to about 2% as Canadian purchasers, taking advantage of the high rate, began to purchase securities payable in either U.S. or Canadian dollars, and as U.S. holders of Canadian shares realized their profits. Official Canadian gold and U.S. dollar reserves rose from U.S. \$1,779,000,000 at the end of 1951 to \$1,830,000,000 at the end of June 1952.

Latin America.—Domestic inflationary conditions, which had sometimes been aggravated by the post-Korean raw material boom, weakened the international economic position of several Latin American countries. Argentina and Uruguay in addition suffered from the sharp fall in wool and linseed prices.

In Argentina various changes were made in 1952 both in the exchange rate structure and in the system of exchange controls. In the summer of 1951 the granting of licences for imports payable with exchange obtained on the free market was suspended because the demand had increased sharply for nonessential imports, particularly automobiles, paid for in this manner. As a result the free dollar rate had risen very substantially. This system of importing was reinstated in Jan. 1952. The balance of payments position continued weak, however, particularly after the price of wool fell, and in an effort to stimulate exports, the government introduced a series of mixed rates applicable to various products. These new rates all implied a substantial depreciation of the peso. From February on, 60% of the proceeds of cheese, butter and casein exports had to be sold at 7.5 pesos per U.S. dollar and the remainder at the free rate of about 10 pesos per dollar, giving a depreciation of 25% from the rate of 7.5 pesos previously used. In July the effective exchange rate for wool exports was depreciated by 20% to 6.25 pesos per U.S. dollar by a similar procedure. Whereas wool exports had previously taken place at the 5-peso rate, now 50% of the proceeds could be sold at the 7.5-peso rate. Further, in February the 7.5-peso rate was made applicable to exports of frozen cooked meats which had previously moved at the 5-peso rate. In a further effort to stem the outflow of reserves tighter import controls were instituted at the end of July.

A very high level of imports brought about by a fear of shortages and increased prices following the Korean war had caused a considerable decline in Brazil's foreign exchange reserves in 1951. The foreign exchange position remained difficult in 1952 despite a purchase of \$37,500,000 from the International Monetary fund in February. The curb rate dropped from Cr\$ 36 to the dollar in October, compared with about 30 at the end of 1951, and rumours of devaluation were prevalent.

Largely because of inflationary developments at home and a fall in the world market price paid for Chilean copper, Chile's balance of payments position was also weak in 1952. The hope which had been raised in 1950 that Chile might proceed to stages to a unitary rate proved false. In a further attempt to stimulate agricultural exports new mixed rates were introduced involving a substantial depreciation of the peso. The free-market rate for the dollar weakened steadily, from about 93 pesos per U.S. dollar at the end of 1951 to 136 pesos per dollar in August

The foreign exchange position of Paraguay remained weak in 1952 and in August, after consultations with the International Monetary fund, important changes were announced in the country's exchange rate structure. These changes involved a substantial devaluation of the guaraní. The par value of 6 guaraníes per U.S. dollar remained unchanged but was applicable only to government nontrade payments. A basic buying and selling rate of 15 guaraníes per U.S. dollar replaced the two rates of 6 and 15 guaraníes per U.S. dollar which had been applicable to most imports. A limited number of essentials such as wheat and petroleum products was imported at a temporary subsidy rate of 6 guaraníes per U.S. dollar, while surcharges of 6 and 15 guaraníes were levied on semiessentials and luxuries, giving effective rates of respectively 21 and 30 guaraníes per U.S. dollar for these classes of goods.

In Uruguay the decline in reserves which had begun in the previous year continued in 1952. It was attributable to the high level of imports generated in part by the 1950-51 boom in wool and was accentuated by the failure of these and other basic exports such as hides to move after the export boom had passed and world market prices had dropped substantially. To correct this weakness, which was reflected in a rise in the free dollar rate from 2.35 pesos per U.S. dollar at the end of 1951 to 2.73 in March 1952, the monetary authorities took various administrative steps to restrict the availability of foreign exchange for imports, particularly those requiring payment in dollars.

The Sterling Area.—The weakening of the sterling area's position, reflected in the \$1,500,000,000 drain in its gold and dollar reserves in the second half of the year, had been the most spectacular international economic development in 1951. It had been caused in part by the continuing deficit with the European Payments union, which was latterly being met fully in gold. Discussion had been held among the commonwealth finance ministers on the means of halting the drain, and each country was to take appropriate measures to ensure that the area as a whole would be in external balance by the end of 1952. For the United Kingdom itself, this was to mean a reduction of its deficit with nonsterling countries to £100,000,000 and the maintenance of a surplus of the same magnitude with the rest of the sterling area.

Following the commonwealth finance ministers' conference, new restrictions had already been imposed in Nov. 1951 on U.K. payments to nonsterling countries, and the first half of 1952 saw further measures taken by the various countries in the sterling area to achieve the aforementioned aims. Licensing controls were tightened in the British Commonwealth countries in March, and additional steps had to be taken in the summer in Australia, in Pakistan and also in the U.K. itself. In that country the over-all deficit on current account of almost £400,000,000, recorded in the second half of 1951, was replaced by a surplus of £24,000,000 in the first half of 1952 so that the U.K. achieved its first objective of balancing with the rest of the world by the end of 1952. Mainly as a result of the cuts made in imports and also because of the increasing volume of U.S. aid, the drain on the sterling area's gold and dollar reserves had been halted by March and these remained fairly steady around \$1,700,000,000 in the second quarter. No doubt because of this improvement the rates for transferable account sterling grew firmer in the summer.

The position of the sterling area remained precarious, however, and the efforts to increase exports were not meeting with the success hoped for. Furthermore, the fall in the prices of some raw materials made it more difficult than had been expected for some of the sterling area countries to improve their balance of payments position. In these circumstances a con-

"HELLO, SHORTY," a cartoon by Manning of the McNaught Syndicate, Inc., published in 1952

ference of the British Commonwealth countries to survey every aspect of the sterling area's financial, commercial and economic problems was arranged for November. It was expected that this would be followed early in 1953 by talks with the United States.

There were no important exchange rate changes in the sterling area in 1952. A par value of Rs. 4.76190 per U.S. dollar was established for the Ceylon rupee on Jan. 17, 1952. This was the same as the effective rate since the devaluations of Sept. 1949. In the course of the year the fall in rubber prices brought about a decline in the country's foreign exchange reserves, and in September the limits on remittances to foreign countries and on basic travel allowances were lowered.

Continental Europe.—There were not many important developments in European exchange control systems in 1952. Such changes as occurred were associated with shifts in the position of various countries either with the dollar area or with the rest of Europe. The latter changes are shown in the operations of the European Payments union. At the end of 1951 Belgium, Italy, Switzerland and Portugal had built up large surpluses with the union; the Netherlands, Germany and Denmark were improving their positions; while France and the United Kingdom were accumulating heavy deficits which they had to meet largely in gold. After the spring of 1952, when France and the U.K. had taken drastic measures to restrict imports, when Italy had tried to expand them by relaxing import and exchange controls and when Belgium had even gone to the extreme position of curbing exports in order to limit the credit it had to extend to the European Payments union, the transactions became more balanced. The positions of France and the U.K., though still weak, were no longer deteriorating so rapidly, while Belgium was no longer recording large surpluses. On the other hand, both Germany and the Netherlands were accumulating substantial surpluses for part of which they were receiving payment in hard currency.

There were few important changes in European rates of exchange. One noteworthy development was the spread of hard

Exchange Rates of Selected Countries

currency "retention schemes" which in fact resembled selective and competitive exchange depreciations. The first had been introduced in the Netherlands, which since 1949 had allowed Dutch exporters to retain 10% of their dollar earnings and sell them at a premium in the free market. Although the plan was adopted in an effort to expand Dutch exports to the dollar area, the premium tended to induce Dutch merchants to search for other foreign goods which might be shipped there, and arbitrage developed in several commodity markets. As a result it was widely alleged that the country using the retention scheme gained hard currency that might otherwise have gone to the countries in which the goods originated. In part as a reaction to the steps taken by the Dutch, similar schemes were adopted in five other countries, Austria (for a time and to a limited extent), France, Denmark, Germany and Norway. Objections to the use of this device were raised at the annual conference of the International Monetary fund, and an investigation of the prevalence and consequences of the practice was instituted.

In Austria export industries had been allowed to retain part of their foreign exchange earnings to meet the cost in foreign exchange of their import needs. On Jan. 2, 1952, these quota arrangements were abolished, and exporters were required to turn over all their export proceeds to the National bank for immediate conversion into schillings. In place of the retention quota, however, preferential treatment in the allocation of exchange for imports was given to the export industries.

Notably because of its continued strong position in the European Payments union, Belgium's gold and foreign exchange reserves rose by the equivalent of U.S. \$150,000,000 in the first half of 1952. The large Belgian surplus caused the E.P.U. acute problems, and it was financed partly by receipts of gold and partly by credits granted to E.P.U. In these circumstances Belgium sought to reduce its surplus with E.P.U. and at the

same time strengthen its dollar position. Various steps were taken, ranging from the blocking, for a period of up to six months, of up to 25% of Belgian export proceeds, to the remission of export taxes on sales to the dollar area. Despite these measures the E.P.U. had to take special steps involving substantial gold payments to cover its deficit to Belgium. Later in 1952, however, when the demand for steel had become less insistent, and when the position of textile exporters was rather difficult, the surplus shrank and the curbs on exports were made less strict.

On the occasion of a drastic monetary reform a new currency was introduced in Bulgaria on May 12. The new leva contained 130.70 mg. of gold and 1.70 leva was equivalent to one rouble. This gave a rate of 6.80 leva per U.S. dollar compared with the previous rate of 288 leva. Like the Rumanian measures of Jan. 1952 and those in Poland and the U.S.S.R. in previous years, the appreciation of the lev had the effect

of bringing it into line with the other currencies of the Soviet bloc, all of which were greatly overvalued in terms of the U.S. dollar. Like the measures taken in these other countries also, however, the change had little or no effect on Bulgarian foreign trade transactions, which continued to be negotiated by state-owned agencies on the basis of world market prices.

Because of the improvement in the country's foreign exchange position in the latter part of 1951, Denmark's exchange restrictions, particularly those relating to travel allowances and other Scandinavian countries and the U.K., were relaxed somewhat in the first half of 1952. The dollar position remained precarious, however, and in an effort to encourage dollar exports a scheme was introduced on Aug. 15 whereby exporters of Danish products to the dollar area were permitted to import European goods that were still subject to quantitative import controls up to a value of 10% of their dollar exports.

The official buying and selling rates for the Finnish market remained at 229 and 231 per U.S. dollar. In order to put an end to uncontrolled transactions in Finnish currency which were taking place at a considerable discount and also to reduce costs for foreign travellers to Finland on the occasion of the Olympic games, preferential rates were introduced on June 1 for tourist transactions. The premiums for purchases of Finnish currency ranged from 34% to 56% above the official rate, with U.S. dollars and Swiss francs carrying the highest, and Norwegian and Danish currencies the lowest premiums. Finnish travellers abroad, on the other hand, had to sell their currency at corresponding discounts.

Mainly because of inflationary developments at home, the deterioration in the French foreign exchange position, which had started in the second half of 1951, gained momentum in the last months of 1951 and the beginning of 1952. In February when the free-market rate in Paris had reached more than

per U.S. dollar and the stabilization fund was losing substantial amounts of hard currency to E.P.U., the French government imposed strict curbs on imports. Later the French position E.P.U. improved somewhat, and the restrictions were eased slightly. However, France's foreign exchange situation remained precarious despite substantially larger U.S. aid. In August the exchange rate for the U.S. dollar had again risen to more than 410 francs, compared with a low of about 390 achieved in May.

In the first few months of 1952 Germany's gold and dollar reserves fell because its hard receipts from E.P.U., although substantial, were not sufficient, together with Mutual Security Agency aid, to cover its dollar deficit. To reduce the dollar gap mainly by eliminating exports of German goods to the dollar area through third countries, the ministry of economic affairs introduced on April 1 a system whereby all exporters could retain 4% of their proceeds to import designated goods for export production. In addition, exporters to hard-currency areas were allowed to retain 36% of their proceeds either for the export of various raw materials and other essential goods or for sale to other importers. In the second quarter of the year German gold and dollar reserves rose again, particularly because of the country's growing surplus with E.P.U.

On Aug. 14 Germany became a member of the International Monetary fund. For the time being, however, no par value was established for the deutschemark.

A monetary reform similar to those carried out in recent years in the other currencies of the soviet bloc was initiated in Rumania on Jan. 28, 1952. Like the other changes it involved sharp appreciation of the leu, and its definition in terms of gold and the rouble, the rate for which was set at 2.80 lei. This gave a cross rate of 11.2 lei per U.S. dollar instead of the previous rate of 150 lei. Like the measures taken by the other countries of the soviet bloc, this step had no practical importance for foreign trade.

At the end of 1951 important changes were made in the Yugoslav economic system. Greater reliance was placed on the market mechanism and less emphasis was given to the centralized direction of production and trade. In 1952 the relaxation of administrative controls was carried further. As of July 1 the monopolistic position of the state foreign trade organization was abolished, and authorized enterprises were allowed to do business with foreign countries. The licence requirements for practically all exports and most imports were withdrawn, but different types of transactions were made more or less attractive by subsidy and surcharge arrangements. Exporters were permitted to retain 45% of their proceeds for their own import needs and also to sell this exchange on the "free" market to other importers who possessed import permits but had not been permitted exchange at the official rate. However, the Yugoslav National bank, which organized these exchange operations, retained the right to intervene in the market.

Middle East.—In the middle east the currencies of some countries weakened in response to the fall in raw material prices. The most striking developments, however, the devaluation of the Israel pound and the weakening of the Iranian rial, were brought about by conditions peculiar to those countries. In Afghanistan the currency was devalued by almost 30% in January when all other efforts to stop the steady fall in the purchasing power of the currency had failed. The new buying and selling rates were respectively 16.08 and 16.71 afghanis per U.S. dollar.

In 1951 when the price of cotton was high, the freedom of Egyptian exporters to dispose of their export proceeds was increased. With the volume and price of cotton exports falling and with the country's transferable sterling balances decreasing, Egypt became short of sterling. To cope with this situation the

scope for transactions in "export pounds" was sharply reduced in the spring. In June further measures were taken. Banks were required to ask importers to cover any credit opened for sterling imports by paying in Egyptian currency the total amount of the credit. In addition import licences had to be obtained for most goods which were produced domestically and also for luxury and semiluxury articles.

Following the stoppage of oil production and exports in mid-1951, Iran's monetary reserves had declined gradually. To re-establish the balance between foreign exchange receipts and expenditures a strict import-licensing policy and an exchange certificate system were inaugurated. Licences were required for all purchases of exchange which were not to be used for the purchase of certain goods considered essential, and foreign exchange was to be furnished only to holders of exchange certificates which could be purchased in the free market from exporters. The price of these certificates rose steadily. When it reached about 83.50 rials per U.S. dollar at the end of April, the Bank Melli was authorized to intervene in the market and buy and sell certificates at 42.50 rials per U.S. dollar. Since the official selling rate was 32.50 this gave an effective selling rate of 75 rials per U.S. dollar.

Because of the continuing disequilibrium in Israel's balance of payments, the free-market rate for the Israel pound had weakened steadily in 1951 and the first months of 1952. On Feb. 20, when it had dropped to 50 cents per pound, compared with the official rate of \$2.80 per pound, a new exchange rate system was adopted. Foreign exchange transactions thereafter took place at three different rates. The old rate of \$2.80 per pound was still applicable to government transactions, to essential imports and diamond exports. Institutional remittances, tourist receipts and the proceeds of various exports, notably citrus fruits, were converted at a rate of \$1.40 per pound, which was also applicable to goods classified as semiessential. The third rate, \$1 per pound, was applicable to other export transactions and, in order to attract private capital from abroad, to most incoming exchange destined for investment.

On Aug. 29 Jordan became the 54th member of the International Monetary fund, without, however, a par value being established for the Jordan dinar.

The exchange rate structure in Lebanon was simplified on May 24 when the government abolished the requirement that companies operating under special concessions (mainly oil companies) purchase 80% of their local currency needs at the official rate of L.L. 2.2 per U.S. dollar. The last of the mixed rates was thus eliminated. Apart from government operations, which continued at the official rate, all commercial and financial transactions were carried on at the fluctuating free rate, which fell slightly in sympathy with the downward trend of the world market price for gold.

Far East.—Apart from the exchange rate changes in Indonesia, which amounted to a substantial devaluation of the rupiah, brought on mainly by inflationary conditions within the country, there were only minor changes in exchange rates and controls in the far east.

Burma became a member of the International Monetary fund on Jan. 3, 1952. No par value was established for the rupee, however, and the effective rate remained unchanged. Effective July 1 a new currency unit, the ryat, was introduced, equivalent to the rupee.

Important changes were made in the exchange rate system in effect in Indonesia. On Feb. 4, 1952, the old exchange rate certificate system was abolished, and a new official rate of 11.40 rupiah per U.S. dollar replaced the old rate of 3.80 rupiah, which had, however, had only nominal significance. This new rate was applicable to all nondollar receipts from exports and

financial transactions and to all essential imports from countries outside the dollar area. For luxury imports from those countries a 70% surcharge had to be added to the official rate, giving an effective rate of 19.43 rupiah per U.S. dollar. For transactions with the dollar area, a certificate system was retained, the aim of which was to maintain a balance between dollar income and outgo. Exporters to the dollar area received, in addition to rupiah at the official rate, negotiable dollar certificates which importers of dollar goods had to produce in addition to rupiah at the rate applicable. At first these certificates were marketed at 2 rupiah per U.S. dollar, giving effective rates for dollar imports of 12.93 and 20.93 rupiah per U.S. dollar respectively. However, the price dropped gradually to 0.25 rupiah per U.S. dollar. Later in the year falling rubber prices caused a drop in Indonesia's foreign exchange reserves, and on Aug. 12, in an effort to curb luxury imports further, the authorities introduced additional surcharges, giving two new effective rates of 22.86 and 34.29 rupiah per U.S. dollar applicable to imports of semiessentials and luxuries respectively. The dollar certificate system was retained and was applicable to all the previously mentioned basic rates.

There was no change in the Japanese exchange rate structure, but the dollar retention scheme in force since 1949 was changed in July to permit exporters to retain a larger proportion of their foreign exchange proceeds to import goods important either for the export industry or for the rehabilitation of the economy. On Aug. 13 Japan became a member of the International Monetary fund, but no par value was established for the yen. (See also GOLD; INTERNATIONAL TRADE; TARIFFS.)

Exploration and Discovery.

During 1952 a considerable amount of exploratory activity took place and a number of expeditions were in the field. The early months of 1952 saw the conclusion of the large antarctic expedition which was under Norwegian-British-Swedish auspices. The expedition had its base in Queen Maud Land, and had devoted several years to a thorough study of this region. Topographic surveying was carried out, both by land parties and also by aerial photography. Ice thicknesses were measured by the sonic method and much other scientific data were gathered. At the end of the antarctic summer the expedition personnel were evacuated and the work which had gone forward over a period of several years was terminated.

During this same time, the Expéditions Polaires Françaises under the leadership of Paul-Émile Victor operated both in the south and north. The southern expedition carried out further exploratory work in Adélie Land, while the northern component operated in central Greenland. Inasmuch as the seasons are opposite, it was possible for several of the expedition personnel, including the leader, to take part in both phases of the operation. Some of the personnel remained in the camps over the winter and carried out routine meteorological measurements as well as making physical studies of ice thickness, movement, temperatures and densities at various depths. The Greenland station was in the centre of the Greenland icecap. The most important geographical discovery was that in places the ground beneath the ice was below sea level, suggesting that perhaps Greenland is in fact two or three separate large islands.

The Juneau Ice Field Research project of the American Geographical society continued its work. The winter party consisted of eight men who spent a month during the middle of the winter at the camp which had been established on the Juneau ice field

in Alaska. The summer party was larger and made mainly geological studies, glaciology and meteorology being included usual. Surveyors and medical officers accompanied the party. This extensive program had been going on since 1948 and a vast amount of scientific material was being gathered.

A French expedition to Mt. Ararat, one of the objectives which was to seek the reputed remains of Noah's ark, returned after scaling the peak and spending some time on the mountain with the report that the large object which had been seen far below and which had given rise to the rumour that it was Noah's ark was in fact a large basalt rock of odd shape.

Oceanographic exploration of the ocean bottom continued, most notable work in this connection being that done by an expedition from the Woods Hole Oceanographic institution and Columbia university. Maurice Ewing, on board the seagoing "Kevin Moran," made an extensive survey of the northwest Atlantic floor, and found that the floor was surprisingly flat. Further, he found it to be transected at one place by a canyon about 300 ft. deep, which was followed for more than 800 miles running in an approximate north-south direction. The gorge was located roughly 800 mi. E. of Boston, Mass.

Important new work was done on the recently discovered islands of ice which were afloat and frozen into the ice field of the Arctic ocean. Three large ice islands, designated as T-1, T-2, and T-3, in the sector north of Alaska and Canada, were selected for study, and the U.S. air force landed a DC-3 equipped with skis on T-3. Astronomical position determinations showed that the island moved about 1½ mi. per day, in an erratic direction. Ice cores were taken to a depth of 22 ft., and several layers of dirt were found. These appeared to be of a wind-carried nature. It was concluded that the movement of the island was mainly caused by wind stresses, since the relative motion of the water was measured and found to be small. Polar bears and foxes were found in this region, as well as a gull-like bird, the jaeger. The ocean bottom, as shown by seismic soundings, lay at 12,000 ft. below sea level in this region, and was comparatively flat. A few suboceanic mountains were found, rising at 3,000 ft. above this flat bottom. The station on T-3 was occupied for several months. Test flights over the north pole and down to Ellesmere Land were undertaken, and a landing was made on T-1, which was found to have the same general characteristics as T-3.

Further attempts to climb Mt. Everest were made during 1952. It was agreed, since there was time in a climbing season for only one serious attempt and since Alpinists from several nations desired the opportunity to climb this peak, that the opportunity to send an expedition in 1952 should go to the Swiss. Accordingly a Swiss expedition started from Nepal and got up to within 1,000 ft. of the summit in the spring. A second expedition, also Swiss, was making another attempt on the peak late in the year. This was the first time that the fall climbing season had been used, as it is generally even shorter than the spring season. An old Himalayan legend, that of the "Abominable Snow Man," again appeared in the news as the Everest climbers reported seeing its tracks. The leader of the Swiss expedition, Edouard Wyss-Dunant, stated that in his opinion there was probably a large bear. In the meantime, Eric Shipton of the Royal Geographical society and other British organizations attempted an ascent of Cho Oyu. This peak is about 26,800 ft. high and is located about 18 mi. W. of Everest. Acclimatization studies were made and new routes pioneered on the Nepalese side of the high peaks.

The ship "Discovery," working for the Falkland Islands Dependencies survey, continued its work in antarctic waters and carried out a number of new studies in this region.

Speleology had an active year, if a somewhat disturbing

Exploration of caves led to some new discoveries and to one tragedy. A group of 15 Italians undertook the exploration of a cave at Vesolo, on the Salerno peninsula. The cave was more than 2,000 ft. deep, the deepest on the peninsula. The expedition was under the leadership of Pietro Parenzan of the University of Naples. A new room about 300 ft. high and a subterranean lake were found. Almost simultaneously a Swiss expedition exploring a new cave in the mountains near Luzern was trapped by waters which rose rapidly after an unexpected rain. Fortunately, the expedition had sufficient food supplies and was rescued after several uncomfortable days. The expedition in the French Pyrenees did not fare so well. Here, during a descent a rope clamp came undone and Marcel Loubens fell to the bottom, where he subsequently died. The cave in this case was named the Pierre St. Martin, and was located in the central Pyrenees close to the Spanish border. Before the accident, the expedition had found several large new rooms, and had recorded a maximum depth of more than 1,100 ft. by sounding fires.

Studies and exploration of the upper atmosphere continued, without any new records being established. A new technique was successfully pioneered in the far north, a rocket being carried aloft by a large plastic balloon and fired from the balloon when it was about 20 mi. up. The technique was found to be workable, and a much smaller rocket was used than would have been necessary if it had been shot up from the ground. The experiments were carried out in Baffin bay. The New York University Cosmic Ray Research project also made a series of high-altitude balloon flights in the vicinity of the north geomagnetic pole for the purpose of measuring the number of cosmic ray neutrons. The number of neutrons must be known to enable the radio-carbon dating procedures to be carried out with accuracy.

The Indian Geological survey was engaged in rechecking all the altitudes of the main Himalayan peaks. Many of the peaks were triangulated upon from distances of 50 mi. or more, and the refraction correction alone in this case was estimated to be as much as 1,000 ft. It was expected that new and improved altitudes would in due course be available. Further evidence seemed to be accumulating that mountain building was still going on, and that the heights of the peaks might be slowly rising. Mt. Fitz Roy, in Argentina near the Chilean border, was included. Although this mountain is not among the highest in the Andes, being only 3,440 m. (roughly 11,000 ft.) in height, the highest 1,400 m. (more than 4,000 ft.) is a granite spike with extremely steep sides. It therefore presented a problem of considerable technical difficulty. This was solved and a French expedition reached its summit.

Further study of the peaks in the Wrangell group in Alaska were carried out. In preparation for a cosmic ray research expedition planned for 1953, Terris Moore, president of the University of Alaska, and Serge A. Korff of New York university flew around and over the peaks, and made practice landings on snow surfaces at various altitudes in order to test the feasibility of logistic support to ground parties.

The Mexican archaeologist Alberto Ruz Lhuillier made an important find at Palenque in the state of Chiapas in Mexico, where a ceremonial chamber, a great altar and several skeletons were found inside what had previously been considered a solid structure. The skeletons were evidently sacrificial victims. This had altered the belief that all Mexican pyramids are merely solid mounds.

An expedition led by W. Q. Kennedy of the University of Leeds, Eng., spent three months in the Ruwenzori, preparing geological maps of the area which, it was hoped, would shed new light on the formation of the Great Rift valley. An expedition under the auspices of the Durham University Exploration so-

ADM. ROBERT E. PEARY'S CACHE, left in 1909 on Ellesmere Island, 413 mi. from the north pole. It was found by members of a U.S. air force expedition on May 4, 1952. The cache of wood-crated metal boxes was marked by a tripod of ski runners

ciety studied glaciology in Iceland near Esjufjoll. An Oxford University Exploration club expedition to Terhi-Garhwal studied the customs of the Himalayan tribes. The expedition of Prince Peter of Greece and Denmark, unable to obtain permission to enter Tibet, made anthropological studies in Nepal and Assam. Export-Import Bank of Washington. From Jan. 1, 1952, through Sept. 15, 1952, the Export-Import bank, as the foreign lending arm of the United States government, approved new loans of \$523,300,000, bringing the total loans authorized since the time of its establishment in 1934 to approximately \$5,800,000,000. Disbursements during this period were approximately \$405,000,000 and repayments \$152,000,000. Outstanding loans and undisbursed commitments of the bank totalled approximately \$3,318,000,000 in 48 countries as of Sept. 15, 1952.

These loans were for development projects designed to strengthen the economic stability of the free world in the fields of transportation, power development, agriculture and industry, including development and expansion of foreign sources of materials essential to U.S. industry in general and the defense stockpile in particular. Such financing is generally limited to the dollar costs of development projects in other countries which increase their productive capacity, thereby improving their foreign exchange position. Loans were also made for the purchase of U.S. raw cotton for use by industries in other countries. The bank also extended credits which assisted U.S. suppliers in financing exports to friendly countries.

Eye, Diseases of the. Toxoplasmosis is a disease of infants and children which occasionally appears in adults as a result of infestation by an organism which had been identified microscopically as a protozoan parasite. The mode of transmission of this parasitic infection from animal to animal or to humans had not by 1952 been demonstrated. The chorioretinitis— inflammations of tissues of the eye—and other ocular changes which occur in human congenital and infantile toxoplasmosis are valuable diagnostic signs of the disease. Before toxoplasmic chorioretinitis was discovered, fundus disease which was frequently observed in the eyes of infants and young children had been variously diagnosed as "foetal chorioretinal infection," "congenital developmental anomaly of the retina and choroid" and "birth injury with chorioretinal haemorrhage." Through the use of proper clinical and laboratory studies, a considerable number of these cases could now be classified as being caused by toxoplasma. In those cases of acquired juvenile and adult toxoplasmosis which had been reported, there were apparently no associated ocular lesions. Toxoplasmosis had not been proved to be the undoubted cause of uveitis in adult patients.

It was reported in 1952 that the organism of toxoplasmosis had been demonstrated in some types of chorioretinitis in adults. Although the cause of some types of choroiditis in children had been known to be toxoplasmic in origin on the basis of serologic examination, the presence of the organism in adults with acquired choroiditis was in doubt until the recent demonstration of the organism in eye lesions previously undiagnosed or thought to be caused by some other disease, particularly tuberculosis.

It was thought that protection of the human lens against cataract formation by X-rays might be provided by the intravenous injection of cysteine if results, which had been successful in experiments on animal eyes, were equally successful in humans. The eye of an untreated animal, when exposed to 1,500 roentgen of X-rays, will become cataractous within a few weeks, but the administration of measured amounts of cysteine just prior to the exposure to X-rays protects the lens from developing a cataract. Another important protective feature was that falling out of eyelashes did not occur. Of a series of chemicals tested, cysteine proved to be the most effective. Large doses of glutathione decreased to a moderate degree the radiosensitivity of the lens. Thiourea also protected the lens from X-ray damage but only to a moderate and equivocal degree. The drugs which did not contain sulfhydryl groups did not have beneficial effects. This discovery supported the chemical mediation theory of biologic effects from radiation against the target theory of direct ionization.

A substitute acrylic lens may be inserted into the anterior chamber of the eye after removal of a cataractous lens. The advantage of this procedure over the usual cataract operation is the possibility of useful vision following removal of the cataract without the necessity of wearing "cataract glasses," which permit good vision over a restricted field and are often difficult to adjust for good binocular vision where only one eye is affected and the other eye has good vision. By the use of the implanted acrylic lens, single binocular vision (stereopsis) may be restored without having to resort to use of contact lenses or to await the removal of a cataract from the second eye. (See also CHEMOTHERAPY; CORTISONE, HYDROCORTISONE AND CORTICOTROPIN.)

Faeroe Islands. A self-governing part of the kingdom of Denmark, the Faeroe Islands are situated in the North Atlantic between Iceland and the Shetland Islands about 200 mi. N.W. of the latter. Area: 540 sq.mi.; there are 21 islands of which 18 are inhabited. Pop.: (1945 census, 29,178; (mid-1951 est.) 32,000. Language: Faeroese, akin to Icelandic rather than to Danish. Religion: Lutheran. The capital is Thorshavn, on the island of Stromo (pop. 1945, 4,390). Governor general in 1952, C. A. Vagn-Hansen.

History.—On Feb. 1, 1952, the Sjoivinnu bank suspended payments; thus the crisis, which dated from large post-World War II investments, was not being overcome either by the subscription of new shares or by the 2,000,000 Kr. loan from the Danish government in Aug. 1951. All the share capital of the bank was lost. The Sjoivinnu bank reopened on Feb. 27 after having been reconstructed by the subscription of 500,000 new shares in the islands, a 1,600,000 Kr. loan from the Danish government, a further 1,350,000 Kr. government loan guaranteed by the Faeroese landsting (upper house) and a 5,000,000 Kr. loan from the Danish National bank, also guaranteed by the landsting. From the European Recovery program fund 4,000,000 Kr. were lent to re-equip the Faeroese fishing fleet. The crisis roused a strong Labour opposition to the Sambandspartiet party and the Folkeflokkurin, the latter, whose leader Thorstein Petersen represented the employers, being held responsible for the crisis. (H. LN.)

Fairs and Exhibitions. **United States and Canada.** Many fairs and exhibitions in the United States and Canada showed a drop in attendance in 1952, but this by no means indicated a slackening of interest in the annual events. Unfavourable weather, polio in widely scattered areas, unsettled economic conditions and the presidential election were blamed for the drop, which was mainly among smaller fairs. Exhibits of livestock, poultry, agricultural and horticultural products and general farm exhibits were up to normal and there was a noticeable increase in the size and content of commercial exhibits. At the Texas state fair, Dallas, 14 implement and farm machinery manufacturers signed more than 100,000 ft. of exhibit space. Among large exhibits were the International Harvester company, Allis-Chalmers, John Deere Plow company and General Motors truck division. At the Michigan state fair, Detroit, Ford automobile dealers erected a \$150,000 exhibit building. Fair executives showed a trend toward emphasizing industries whose operations were conducted within their state or within the drawing area of their town. An example was the Wisconsin state fair's huge array of exhibits under the title "Wisconsin at Work." A new trend was shown in exhibits of large brokerage firms, which turned to fairs as a fertile field for interesting people in stocks and bonds. At the Florida state fair, Tampa, two large firms had comprehensive exhibits showing how stock, bond and commodity markets operate, and similar exhibits were being planned for other leading fairs in 1953.

While entertainment at fairs is more or less standard, many of the smaller annuals which in the past had preserved mainly acrobatic and thrill acts added revue type shows for the night grandstand offerings, and these proved popular. The more than 2,000 fairs of the country spent in excess of \$10,000,000 for entertainment in 1952. Budgets for the grandstand revues ranged from \$1,500 at small fairs to \$25,000 or more at

large state fairs and provincial exhibitions. There was a marked falling-off in horse racing as an afternoon attraction and a corresponding increase in auto racing and auto thrill shows, which were among the most popular attractions.

The Canadian National exhibition, Toronto, Ont., again led all fairs in attendance, setting a record figure of 2,717,000. The exhibition's fair plant continued to be the finest in North America. Its grandstand, built after World War II, seats 25,000 and cost more than \$5,000,000. Attendances at the western Canada fairs—Edmonton, Calgary, Regina, Saskatoon—were on a par with those of 1951, but most of the eastern Canada exhibitions drew slightly smaller crowds than during the previous year.

In the United States the 16-day Texas state fair came close to its 1951 record, and the Los Angeles county fair, Pomona, Calif., drew a record 1,085,478 attendance in 17 days. These two fairs led all others. The Minnesota state fair, St. Paul, had its lowest attendance since World War II, 819,015, because of a polio epidemic. The California state fair, Sacramento, drew 778,756 in 11 days, a new high; the Michigan state fair, Detroit, attracted 630,240 against 708,000 in 1951; the Indiana state fair, Indianapolis, 650,500 in 10 days; the Iowa state fair, Des Moines, 511,008 compared with 543,461 in 1951; the New York state fair, Syracuse, 417,365; the Kansas Free fair, Topeka, 390,000; the Kentucky state fair, Louisville, 314,948, a drop from 1951 because of polio; the Ohio state fair, Columbus, 168,468.

State fairs continued to increase in size and importance. Plants of the state fairs in Minnesota, Indiana, Illinois, Iowa and several other states each represented an investment of several million dollars. New and better exhibit buildings were being built, and more generous premiums for exhibits were being offered. At the Illinois state fair in 1952 premiums paid amounted to \$193,993, more than half of it for livestock. The fairs were credited with providing a strong incentive for livestock breeders to improve their herds and for encouraging young farmers to raise better farm products. (See also PHOTOGRAPHY.)

(NA. G.)

Great Britain.—The 31st British Industries fair (May 5-16, 1952) was held as usual at Olympia, Earls Court, London, and at Castle Bromwich, Birmingham. The fair was visited by Queen Elizabeth and the duke of Edinburgh on May 6. A commonwealth trade day was held at Earls Court on May 14. The attendance of overseas visitors was down by about 25% from 1951 and at the London sections the number of home visitors declined by about 30%. There were 2,472 exhibitors—slightly less than in 1951. The total attendance at Castle Bromwich was 194,891.

The Radio show was again held at Earls Court at the end of the summer season (Aug. 26-Sept. 6). With the extension of television to the north of England, a radio and television exhibition was held at City hall, Manchester (April 23-May 3), the first held in the north of England since World War II. More than 1,025,000 persons visited the *Daily Mail* Ideal Home exhibition at Olympia (March 4-29).

The 37th Motor show was held at Earls Court (Oct. 22-Nov. 1). Many of the cars on show were available for immediate delivery for the first time since World War II. The first Commercial Motor Transport exhibition in two years was held in the same hall (Sept. 26-Oct. 4).

Civil and military aviation was shown at the annual flying display and exhibition of the Society of British Aircraft Constructors at Farnborough (Sept. 2-7). A serious accident on Sept. 6 caused 27 deaths, but despite this about 350,000 persons attended the exhibition—140,000 on the day after the accident.

The fifth London Fashion fortnight was held from June 4 to

CARNIVAL LIGHTS on the midway at the Kansas Free fair for agricultural exhibitors which opened at Topeka in Sept. 1952

June 18. Consisting of wholesale fashion displays covering the whole range of women's wear, this event attracted many overseas buyers to London.

Agricultural Shows.—The widespread outbreaks of foot-and-mouth disease throughout England, Wales and Scotland caused many show societies to cancel their cattle classes. This naturally affected attendances but, at many shows, these were only slightly below the 1951 figures.

The annual show of the Royal Agricultural Society of England was held for the first time in Devon at Newton Abbot (July 1-4). The total attendance was 93,318, about 40,000 fewer than at Cambridge in 1951.

Ashton Park, Preston, was the venue for the Royal Lancashire Agricultural show (Sept. 3-6). There were 4,204 entries, or only 216 fewer than in 1951. The society was considering a permanent showground for future shows. The Great Yorkshire show was held at Harrogate (July 7-9). The only livestock on show were horses. The largest show in the home counties was the Royal Counties at Guildford (June 17-21). The total attendance was 51,693 or 1,000 more than at Southampton in 1951. The Three Counties show went to Worcester (June 10-12), and the Bath and West to Wollaton Park, Nottingham (May 28-31). The total attendance was 73,775 or 16,000 fewer than in 1951 and about the same as in 1950 when the show was last held in the Midlands. The leading agricultural show in Wales, the Royal Welsh, went to Caernarvon (July 23-25); Scotland's premier show, the Royal Highland, was held at Kelso, Roxburghshire (June 17-20); and Ulster's show, the Royal Ulster, was held at Balmoral, Belfast (May 21-24). All these agricultural shows were handicapped by the absence of cattle, sheep and pigs.

Commonwealth.—An exhibition was held in Colombo, Ceylon, to display the work of the Colombo plan. This was the most

spectacular function in Ceylon for many years. Malta's first trade fair was held in October. The total attendance was 48,200 and there were 100 exhibitors.

From June 19 to 21 the Kenya Royal Agricultural show was held in the New Mitchell park, Nairobi. The Van Riebeeck festival fair at Capetown, U. of S.Af., to mark the 300th anniversary of the colonization of South Africa, was opened by E. G. Jansen, governor general, on March 13. The 44th Rhodesian Agricultural and Horticultural show at Salisbury attracted 56,752 people, a new record.

Fair Trade Laws: *see* LAW.

Falk Foundation, Maurice and Laura: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Falkland Islands. British colony and dependencies in the South Atlantic. The colony consists of East and West Falkland and adjacent islands. Dependencies: (1) South Georgia (four whaling stations) with South Orkney and South Sandwich and (2) South Shetland and Graham Land. Area of colony: 4,618 sq.mi. Pop.: (1946 census) 2,239; (1951 est.) 2,300, mainly of British descent and Protestant. Only town, Stanley (cap.; *c.* 1,250). Governor in 1952, Sir Miles Clifford.

History.—Of the two Colonial Development corporation projects in the colony, one, the building of a freezing plant for beef and mutton, continued and was expected to be in production by May 1953; but the other, a sealing project, was abandoned during 1952 because of a fall in the price of oil and a marked falling off in the number of seals coming to the beaches. A £10,000 grant from Colonial Development and Welfare funds was being made to improve local broadcasting from Port Stanley.

The uneasy political situation in the dependencies continued, with Argentine and Chilean bases established on British territory as well as those of the Falkland Islands Dependencies survey. At Hope bay in Graham Land Argentine personnel fired on a British party landing stores, but the Argentine government admitted that it was done in error and there were no repercussions.

(K. G. B.)

Education.—Nine schools; also travelling teachers. Pupils (1951) 340.

Finance and Trade.—Currency: sterling, with local notes. Budget (1952-53 est.): revenue £336,606; expenditure £330,919. Foreign trade (1951): imports £3,312,000; exports £3,723,000. Principal exports: wool, hides and skins.

Industry.—Whaling (1951-52 season): catch 2,630 whales; oil 144,614 bbl.; guano 112,383 bags; total value of products £2,358,657.

Famines: *see* AGRICULTURE.

Farm Co-operatives: *see* CO-OPERATIVES; FARM CREDIT ADMINISTRATION.

Farm Credit Administration. Farmers and farmers' co-operatives in the continental United States and Puerto Rico obtained \$2,400,000,000 in loans in the year ended June 30, 1952, from the banks and associations operating under the supervision of the Farm Credit administration of the U.S. department of agriculture. This may be compared with \$2,200,000,000 for the year ended June 30, 1951.

This co-operative farm credit system operates through 12 district offices and local credit co-operatives. Farmers obtain short-term operating credit from 499 local production credit associations and long-term farm mortgage credit through 1,180 local national farm loan associations. Each farmer-borrower is a member and owns capital stock in his association equal to at least 5% of his loan. Farmers' business co-operatives deal directly with the bank for co-operatives of the district in which

the co-operative is located or, in the case of the large regional co-operatives, with the Central Bank for Cooperatives. Each borrowing co-operative owns stock in the bank for co-operative from which it obtains its loan.

Farmers and farmers' co-operatives at June 30, 1952, owned more capital stock in their co-operative farm credit system than at any previous time. They owned a total of \$180,000,000 compared with \$155,000,000 at June 30, 1951.

Farmer-borrowers owned all the capital stock of the national farm loan associations and, through their associations, all the capital stock of the 12 federal land banks. The capital stock of the 12 federal land banks totalled \$65,000,000 on June 30, 1952, compared with \$61,500,000 the year previous.

Farmer-members of production credit associations owned \$96,600,000 in capital stock of their associations, compared with \$77,000,000 on June 30, 1951. Government capital in these associations declined from \$12,700,000 on June 30, 1951, to \$8,700,000 on June 30, 1952. During the year, the production credit associations increased their membership from 468,468 to 475,546. On June 30, 1952, 243 production credit associations were completely member-owned compared with 179 on June 30, 1951, and 134 on June 30, 1950.

Farmers' co-operatives increased their capital ownership in the 13 banks for co-operatives from \$16,500,000 on June 30, 1951, to \$18,000,000 on June 30, 1952.

Farmers in the year ended June 30, 1952, obtained 41,500 farm mortgage loans amounting to \$237,000,000 through the national farm loan associations and federal land banks. This may be compared with 40,377 loans for \$206,000,000 for the previous year. On June 30, 1952, farmers were using 310,638 land bank loans totalling \$1,000,000,000, the largest amount since July 1945. Funds used to make these loans were largely obtained by the sale of consolidated farm loan bonds to investors. The bonds are not guaranteed in any way by the United States government.

In the year, farmers obtained 281,062 loans totalling \$1,400,000,000 in credit from the 499 production credit associations compared with 286,619 loans and \$1,200,000,000 in the year ended June 30, 1951.

Farmers' marketing, purchasing and business service co-operatives obtained 1,417 loans for \$537,000,000 in operating capital, facility and commodity loans from the 13 banks for co-operatives in the year ended June 30, 1952, compared with 1,607 loans for \$510,000,000 the previous year. The number of loans made by the 13 banks decreased 11.8%, but the amount of loans increased 5.4% over the preceding year. The funds obtained were used directly in purchase of farm production supplies and marketing, processing or distributing foods and fibre products by farmers.

The 12 federal intermediate credit banks, the principal source of loan funds of the production credit associations and of part of the loan funds of the 13 banks for co-operatives, as well as certain types of privately financed credit institutions, made loans and discounts in the year ended June 30, 1952, totalling \$2,000,000,000 compared with \$1,900,000,000 in the year ended June 30, 1951. The consolidated debentures of these banks sold to investors were the source of their loanable funds. The debentures are not guaranteed by the United States government. The banks' total loans and discounts for the year included 82.7% for production credit associations, 5.8% for banks for co-operatives, 10.9% for privately capitalized institutions and 0.6% for farmer co-operatives.

Another important work of the Farm Credit administration is carried on through its co-operative research and service division. As directed by congress in the Cooperative Marketing act of 1926, it conducts research and service activities to help farmers through their co-operatives develop sound merchandising

ising, management, accounting, membership and other programs important to the success of the purchasing and marketing ranches of their business. This division had under way 102 research and service projects under this program during the year ended June 30, 1952.

(I. W. D.)

Farmers Home Administration. The major emphasis of this agency of the U.S. government in 1952 was placed on helping small farmers make full use of their land, labour and capital resources. Many of the farm families who received assistance were young couples, particularly war veterans. They borrowed funds to purchase foundation livestock, tractors, fertilizer and similar operating essentials; to add additional acres to their farms or to improve the land they already owned; to build or repair farm houses; and to build or improve their farmstead water supply systems.

Developments during 1952 included an increase in the average size of farm operating loans, a widespread demand for emergency production loans because of the drought, and a steady increase in farm housing loan activity.

The average size of initial loans needed to meet farm operating expenses rose from \$1,795 in 1951 to \$2,680 in 1952. The demand for larger loans had been increasing for several years as the cost of farm operating expenses rose. Legislation passed by congress in 1951 made it possible to meet the need for larger loans.

The widespread drought of 1952 made it necessary to designate most of the southeastern and New England states as disaster areas. In these areas special disaster loans were made to farmers to buy feed, to re-establish pastures and to take other steps to maintain production.

In the early months of 1952 the increased housing loan activity exhausted the annual fiscal year appropriation for these loans. Additional funds, approximately \$19,000,000, were made available on July 1 by congress.

Through Aug. 1952 loans were made to 69,475 families who had no other source of credit to finance improvements in their operations, buy or improve farms, or continue in production after drought or similar disaster. Veterans received about 53% of the appropriated funds advanced.

The agency's farm and home management supervisors helped the farmers who received the loans to develop systems of farming that would get maximum income from their farms and still maintain the strength of their soil.

Operating loans totalling \$80,546,476 were made to 42,729 families. Approximately 2,417 loans were made for the purchase or improvement of family-type farms. The farm ownership loans amounted to \$20,591,942, of which \$8,136,092 was advanced to private lenders with the guarantee of the government that the loans would be repaid in full.

Housing loans totalling \$16,671,528 were made to 3,123 farm owners for the construction or repair of homes and farm buildings. Water facilities loans amounting to \$3,880,806 were made to 936 individuals and 39 associations in the west. Emergency loans amounting to \$29,184,574 were advanced from a revolving fund to 20,270 farmers who had production losses from drought and similar disasters.

Records of families who completed paying their loans showed substantial increases in their production and their equity in farm equipment, livestock, land and other means of production. For example, the 34,595 borrowers who repaid their operating loans in full and continued to farm increased their farm production from an average of \$2,021 to \$3,356 during the three and one-half years they operated with the aid of supervised credit. Their average net worth rose from \$2,667 to \$5,029.

Total principal and interest repayments during the first six months of 1952 were \$56,803,583, including \$2,068,650 collected on behalf of private lenders under the insured mortgage program.

In June congress passed legislation extending the farm housing program an additional year, through June 30, 1953. Basic legislation authorizing the agency's other loan services had no termination date.

Farm Population: see CENSUS DATA, U.S.

Farouk Fuad, PRINCE (1920—), the only son and eldest child of King Fuad I of Egypt and the great-great-grandson of Mohammed Ali, founder of the dynasty, was born in Cairo, Egy., on Feb. 11. In 1935, as Prince Said, he was sent to England to complete his studies. Upon his father's death on April 28, 1936, he returned to Egypt, where a regency council acted for him until his coming of age on July 29, 1937, when he was invested as king. On Jan. 20, 1938, he married Farida, daughter of Zulfikar Pasha; three daughters were born and on Nov. 17, 1948, the marriage was dissolved. On May 6, 1951, he was married to Narriman Sadek, the daughter of a government official, and a crown prince, Ahmed Fuad, was born on Jan. 16, 1952. At the end of January there were riots in Cairo and Farouk dismissed his prime minister, Mustafa el Nahas Pasha, for failing to maintain order. The king's popularity was waning rapidly, particularly in army circles, and on July 23 occurred a military coup d'etat led by Mohammed Naguib, which resulted in Farouk's abdication three days later in favour of his son, who became Fuad II. King Farouk, his wife, son and three daughters left Egypt the same day. On July 29 Farouk asked Pres. Luigi Einaudi of Italy to allow him to stay in Italy for an indefinite period as a private citizen. President Einaudi consented and Farouk and his family moved to Capri for the first part of their exile.

Fascism. Fascism continued in 1952 in power in Spain and in Argentina and seemed to gain in influence in some Latin-American countries. These semifascist regimes were backed, like the regime of Juan D. Perón in Argentina, by the armed forces, while they were at the same time supported by the masses, to whom they appealed with the promise of social betterment and with strong invectives against United States "plutocracy." Peronism aimed at organizing a confederation of Latin-American states for protection against United States "aggressive imperialism." In Asunción, Parag., a Committee of United Latin American Trade Unions was formed for "joint actions against capitalist imperialism." There Jose G. Espejo, secretary-general of Argentina's all-labour confederation, declared that his country was desirous of winning liberty for "all the humble who have suffered so long under Roosevelt's imperialism." He asked the conference to pay homage to Puerto Rico "because it has not gained its independence yet." Peronism was eager to influence not only Argentina's small neighbours like Paraguay and Bolivia, but also Chile and Brazil, and to a certain extent it was successful.

On May 1, 1952, the holy day of labour, Perón turned over the expropriated *La Prensa*, formerly the greatest liberal and independent newspaper in Latin America, to the Argentine General Confederation of Labour, which was the main stronghold of the Peronista regime.

Neofascist forces in Germany showed no appreciable strength in 1952, because they were organized in small splinter groups without any strong or united leadership. The largest of these

groups, the Sozialistische Reichspartei, which boasted of 40,000 members and received 370,000 votes at the May 6, 1951, election in the state of Lower Saxony, was torn by internal conflict which came into the open in Aug. 1952. On Sept. 12 it announced its dissolution, and nine officials of the party were arrested for organizing a fascist congress under the guise of a "national rally movement." On the other hand, nazi sentiment was widespread among parties which declared themselves opposed to naziism but which repeated many of the nationalist slogans of naziism and tried to win the votes and adherence of the members of the former nazi party and of the nazi elite.

A definite increase of fascist forces was noticed in 1952 in Italy, where persons like the former Marshal Rodolfo Graziani adhered to it. The Italian Social Movement, as the neofascists called themselves, showed very appreciable gains in the municipal elections at the end of May 1952. In coalition with the monarchists they won control of many important cities in southern Italy, especially of the two strategically important ports of Naples and Bari. Influenced by these results, the minister of the interior, Mario Scelba, proposed a law to the Italian chamber which would authorize the government to disband neofascist parties. This was to be done not in a repressive but in a preventive spirit, and not with the intention of building up an antifascist front but of strengthening democracy.

FBI: see FEDERAL BUREAU OF INVESTIGATION.

Fechteler, William Morrow (1896-). U.S. chief of naval operations, was born on March 6 in San Rafael, Calif., and was graduated from the U.S. Naval academy at Annapolis, Md., in 1916. He served aboard the flagship "Pennsylvania" of the U.S. Atlantic fleet during World War I. He was operations officer of the fleet destroyer command at the outbreak of World War II, and early in 1942 was named assistant director of the bureau of naval personnel. During the campaigns in the Pacific, he commanded the battleship "Indiana," and later commanded an amphibious group, a carrier and a task force. He was named assistant chief of naval personnel in 1945 and deputy chief of naval operations for personnel in 1947; on Feb. 1, 1950, as a four-star admiral, he became commander in chief of the Atlantic command and fleet. He served as chairman on the North Atlantic Ocean Regional Planning group, largest in the North Atlantic Treaty organization. In 1951 he was prominently mentioned for the post of NATO supreme Allied commander in the Atlantic, but when Adm. Forrest P. Sherman died, Admiral Fechteler was named to succeed him as U.S. chief of naval operations. He assumed the office on Aug. 7, 1951.

In the summer of 1952 Fechteler made an extensive tour of the far east. After visiting Formosa he declared his belief that the Chinese nationalists were fully capable of defending the island against an invasion from the mainland. He also predicted that the Chinese Communists would sign a truce in Korea.

Federal Bureau of Investigation. As the investigative arm of the United States department of justice, the Federal Bureau of Investigation has jurisdiction over more than 130 violations of federal law. Established in 1908 as a fact-finding agency, the FBI does not evaluate the results of its investigations or make prosecutive recommendations.

The two primary areas of FBI activity are general investigations and security operations. Within the latter field, it has jurisdiction over espionage, sabotage and subversive activities on a nation-wide scale.

During the 1952 fiscal year, much of the FBI's investigative time was directed toward the Communist party in the U.S. which attempted to conceal its activities in an underground work. In addition, the FBI continued to discharge its responsibilities for the national security in the fields of espionage and sabotage.

A further service of the FBI within the field of national security is the co-ordination of security information for dissemination to other government agencies which are authorized to receive it.

In the area of general investigative activity, the FBI located 11,100 fugitives during the 1952 fiscal year, a marked increase over the 6,370 fugitives it located in 1951. In 97.2% of the cases brought to trial during this period, verdicts of guilty were returned. There were 9,036 convictions compared with 8,000 in the preceding fiscal year. Sentences imposed totalled 22 years, 7 months and 23 days. Six persons received life imprisonment.

During the 12-month period ending June 30, 1952, 12 automobiles were recovered in cases investigated by the FBI. Fines imposed and the value of property recovered totalled \$918,535, an increase of more than \$22,000,000 over 1951. Negotiation act claims adjusted in favour of the government which were investigated by the FBI, totalled \$55,089,810.

In addition to its investigative activities, the FBI provides several co-operative services for law-enforcement agencies. Among these is the identification division, which provides a national repository for identification data based on fingerprints. At the close of the 1952 fiscal year, there were 124,417 sets of fingerprints on file in the FBI identification division. An average of 19,993 sets of fingerprints were received each working day from the 12,575 contributors to the identification division.

Services of the FBI laboratory are available to police and other agencies of the federal government free of charge. These services include the examination of evidence and the court testimony of laboratory technicians as expert witnesses. In the 1952 fiscal year the FBI laboratory completed 109,733 examinations, an increase of 4.6% over the preceding 12-month period.

Upon request, the FBI co-operates with local law-enforcement agencies in special training programs. These include the FBI National academy, which is conducted in Washington, D.C., and on the U.S. marine corps base at Quantico, Va., and police training schools which are conducted on a departmental basis throughout the nation. Represented among the 2,528 graduates of the FBI National academy as of July 31, 1952, were members of police agencies in all states and territories, as well as several foreign countries.

An additional FBI service to law-enforcement agencies is the publication of the *FBI Law Enforcement Bulletin* and the *Uniform Crime Reports*. Published monthly, the *FBI Law Enforcement Bulletin* provides a medium for exchange of ideas between law-enforcement agencies. The *Uniform Crime Reports Bulletin* is a statistical analysis of local crime on an annual and semi-annual basis.

The 52 field offices of the FBI are located in major cities throughout the United States and in Hawaii, Puerto Rico, Alaska. (See also CRIME; JUVENILE DELINQUENCY; POLICE; SECRET SERVICE, U.S.)

(J. E. H.)

Federal Communications Commission.

Resumption of the construction of new television stations on a greatly expanded and technically improved basis, following lifting of the four-year ban by the Federal Communications commission, highlighted the broadcasting field in 1952.

The commission's final decision, issued in April, authorized the use of 70 ultra-high-frequency channels to supplement the very-high-frequency channels previously employed, adopted new technical standards for the operation of stations to minimize interference, and set up procedures for the ultimate disposition of applications for station construction permits.

Prior to the lifting of the freeze on new construction, there were 108 stations operating in 63 cities. The new table of television frequency assignments issued by the commission made possible more than 2,000 stations in 1,300 communities throughout the United States, its territories and possessions. The plan was designed to make stations and service available in the smaller towns and the rural areas as well as the metropolitan centres.

An important part of the new system was the reservation of 2 channels in a like number of cities for use by educational institutions. At least one such assignment was made to every state in the United States and several states were assigned sufficient channels to permit the establishment of a state-wide educational network. The reservation of these 242 assignments was based upon representations made to the commission by leading educators as to the potential of television for education.

The commission resumed processing of applications for new television stations in July. By Oct. 15 the commission had received 750 applications and had issued construction permits for 12 new very-high-frequency stations and 56 new ultra-high-frequency stations in 50 communities. These included two very-high-frequency grants and seven ultra-high-frequency grants to educational institutions. The first ultra-high-frequency station began operation in Portland, Ore., in September.

The nation's television network relay system was expanded in 1952 to include all but one (Albuquerque, N.M.) of the 111 stations in operation as of Oct. 15. Further extensions were planned to accommodate new stations as they went on the air. The National Production authority lifted its ban on colour television equipment, except the production of home-type sets, in June. By the terms of this order the manufacture of colour equipment for theatre, industrial and other nonhome uses was permitted. Under certain specified conditions permission was to be given for home use but the authority pointed out that few manufacturers could qualify to produce home-type sets under requirements because of shortages in qualified personnel and certain critical materials.

The National Television System committee, composed of various industry experts, continued its study of the possibilities of a compatible colour television system.

Financial tabulations completed by the commission in 1952 showed that television broadcasters, who lost \$25,000,000 in 1949 and \$9,000,000 in 1950, earned \$41,000,000 in 1951, before federal income taxes. There were 18,500,000 television receiving sets in use.

A hearing was scheduled for the latter part of the year on a petition to set aside channels for theatre television. A petition for a hearing on subscriber television was pending before the commission.

About 2,350 standard (AM) radio stations were in operation. Use of radio in the telephone and telegraph services continued to grow during the year. Figures compiled by the commission showed that the public outlay for interstate telephone and telegraph services in 1951 reached a record of \$4,000,000,000. It was necessary to increase rates for certain classes of telephone and telegraph services during the year.

The safety and special radio services continued their rapid expansion during the year, the number of stations reaching 15,000. Establishment of the Radio Amateur Civil Emergency Service provided for participation by radio amateurs in civil

defense communications in event of a national emergency. (See also RADIO; TELEGRAPHY; TELEPHONE; TELEVISION.)

(P. A. W.)

Federal Deposit Insurance Corporation.

In the fiscal year July 1, 1951, to June 30, 1952, three insured banks with total deposits of \$5,812,180 required the assistance of the Federal Deposit Insurance corporation. More than \$3,000,000 was distributed by the corporation to facilitate mergers of these banks with solvent insured banks. Depositors in the distressed banks were thereby fully protected against loss.

Since its inception the Federal Deposit Insurance corporation had aided 419 banks with deposits totalling more than \$539,000,000. Depositors had lost less than \$2,000,000 of this amount. Liquidation of the assets of these banks had been completed in all but six cases at the end of fiscal 1952.

As of Sept. 19, 1951, the Federal Deposit Insurance corporation called for special reports from all insured banks for the purpose of estimating its contingent liability in insuring bank deposits. The banks reported 112,000,000 deposit accounts, of which 110,000,000 or 98.5% had balances of \$10,000 or less and were therefore considered to be fully protected by deposit insurance. On the basis of the survey it was estimated that insured deposits totalled \$96,400,000,000 out of a total of \$176,700,000,000 of deposits held by 13,655 insured banks on June 30, 1952. On that date the corporation's surplus, or deposit insurance fund, totalled \$1,322,485,000.

The board of directors of the Federal Deposit Insurance corporation was composed of Maple T. Harl, chairman, Preston Delano, comptroller of the currency, vice-chairman, and H. E. Cook.

Federal Land Banks: see FARM CREDIT ADMINISTRATION.

Federal Power Commission. In the first six months of 1952 the Federal Power commission authorized 1,915 mi. of natural gas pipe line facilities costing an estimated \$235,420,973. They were designed to add more than 1,250,000,000 cu.ft. to the daily delivery capacity of the nation's transmission systems, and would benefit 101 cities of 50,000 population or more in 25 states and the District of Columbia, as well as numerous smaller communities. During the fiscal year ending June 30, 1952, the commission authorized construction of 3,378 mi. of pipe line and compressor units aggregating 539,510 h.p., costing \$321,919,895. Since Feb. 7, 1942, when the existing certificate provisions of the Natural Gas act became effective, the FPC had authorized approximately 45,800 mi. of pipe lines and 3,300,000 h.p. compressor units at an estimated cost of nearly \$3,200,000,000, designed to add more than 17,000,000,000 cu.ft. of daily delivery capacity to the nation's gas pipe line systems.

Wholesale natural gas rate increase applications totalling approximately \$140,312,000 annually, filed by 25 companies, were acted upon, and \$19,200,000 were filed in June, too late for action, making a total of \$159,512,000 filed during the fiscal year. These represented a sixfold increase over the \$22,300,000 filed in the previous year, and were more than 200 times greater than the \$645,000 in increases filed in 1949, Chairman Thomas C. Buchanan announced. Of the \$140,312,000 acted upon in fiscal 1952, \$139,032,000 was suspended, \$1,280,000 accepted. The commission disallowed \$22,117,000 of the suspended filings, allowed \$15,295,000 to become effective, and permitted companies to withdraw \$7,103,000. Of the remaining \$94,517,-

000, \$36,001,000 was in effect under bond awaiting the commission's determination of the amounts to be allowed, and \$58,516,000 was still under suspension. Including the carry-overs, there was still a total backlog of nearly \$104,000,000. In addition, rate increases totalling \$72,852,000 were either suspended after June 30 or were awaiting commission action.

During the 12-month period ending June 30, 1952, the commission issued licences for hydroelectric projects having a total installed generating capacity of 1,410,900 kw., representing an investment of \$363,672,000. A record 125 applications were filed and 149 cases were completed. In the last 11 years the commission had issued licences for projects having a total installation of 3,794,000 kw. representing an estimated cost of \$874,551,000.

As of June 30, 1952, there were 673 FPC licences in effect involving a total installed capacity of 5,750,000 kw. and a claimed cost of \$1,419,000,000.

Combined utility and industrial production of electric energy passed the 450,000,000,000-kw.hr. peak for the first time in the 12-month period ending Aug. 31, reaching 450,573,305,000 kw.hr., 6.9% above the previous year. Electric utility production totalled 388,490,903,000 kw.hr., an increase of 8.1%. As of Aug. 31, total installed capacity of utility plants was 78,307,864 kw. and industrial generating capacity reached 14,685,586 kw., making a combined total of 92,993,450 kw. In the first six months of 1952, largely because of the steel strike, only 2,011,015 kw. of new capacity were added, of which 323,510 kw. were industrial and 1,687,505 kw. were utility. But during the fiscal year public utilities added 5,165,905 kw. and industrial plants 756,744 kw., a total of 5,922,649 kw.

Use of gas by electric utility plants in August reached a new high of 104,965,791,000 cu.ft., 18.7% above Aug. 1951 consumption. Coal stocks on hand Sept. 1 totalled 42,107,618 tons, 12.5% more than a year earlier, sufficient to last 152 days. Coal consumption was 8,569,173 tons, 4.4% less than in the same month a year earlier.

River basin and water power development studies made included the St. John, Kennebec, Androscoggin, Raquette and other rivers in the New England-New York area; the Alabama-Coosa, Tombigbee and Santee in the southeast; the Ohio river, including the Allegheny and Monongahela; tributaries of the upper Mississippi; the Missouri and tributaries; the Arkansas, White, Red and Guadalupe rivers in the southwest; the Columbia river and tributaries in the northwest; the Sacramento and tributaries in California; and the upper Colorado. The commission's field staff co-operated with the corps of engineers in 52 investigations, with the bureau of reclamation in 56 basin surveys or project investigations and with the department of the interior in flood control surveys in various watersheds.

Federal Power commission studies of water power potentials indicated that, including projects under construction or authorized, the total undeveloped water power of the United States was approximately 87,000,000 kw., which, if developed, would be capable of generating about 385,000,000,000 kw.hr. annually. Of this undeveloped power, 55%, or about 48,000,000 kw., was west of the continental divide, with 40%, or about 35,000,000 kw., in the north Pacific area, of which about 31,000,000 kw. were in the Columbia river drainage system. Of the remainder, California had about 7,500,000 kw., or 8.6%, and the Colorado river basin 5,300,000 kw., or 6.1%. The Missouri river basin had about 8,700,000 kw. of undeveloped water power, or 10% of the United States total. The largest concentration of undeveloped power east of the Mississippi river was in the north Atlantic drainage area, extending from the St. Croix river in Maine to the Rappahannock river in Virginia, with about 7,400,000 kw., or about 8.6% of the national total.

(See also ELECTRICAL INDUSTRIES; GAS, NATURAL AND MANUFACTURED.) (J. W. JE.)

Federal Reserve System. During the year 1952 the federal reserve system made further progress toward a more flexible open market policy. Inflationary pressures lessened, most selective credit controls were suspended. After extensive questionnaires, three weeks of hearings and further study, the congressional subcommittee on general credit control and debt management, with Representative Wright Patman of Texas as chairman, made its final report concerning the framework of the nation's monetary management.

Late in March the president requested the suspension of state, municipal and public-body financing by the regional voluntary credit restraint committees. In May the screening of applications for all financing was ended, and the voluntary credit restraint program was suspended. This action was taken by the concurrence of the board of governors in the recommendation to this effect by the national voluntary credit restraint committee. Finally, the Defense Production act amendments of 1952 ended statutory authority for any voluntary program for the control of credit.

The board of governors of the federal reserve system, effective March 24, amended Regulation W, relating to consumer credit, by removing the prescribed minimum down payment and maximum loan value in connection with home repairs. The board also, effective April 8, amended Regulation W so as to exempt all listed articles costing less than \$100 from the prescribed minimum down payment and maximum loan value. The board of governors recommended to congress that authority for the regulation of consumer credit be continued after June 30, 1952. Strong opposition to consumer credit control developed, however, and the board of governors suspended Regulation W effective May 7.

Somewhat later, in amending and extending the Defense Production act, congress repealed the authority for the control of consumer credit.

During the year Regulation X relating to real estate credit was first eased and later suspended. With the concurrence of the Housing and Home Finance agency, the board of governors effective June 11, amended the regulation to permit more liberal credit terms for conventionally financed one-family and four-family housing built after Aug. 3, 1950, and to reverse downward the minimum down-payment requirements for multi-unit housing. This action was accompanied by similar changes in the related regulations of the Federal Housing administration and the Veterans administration covering FHA-insured mortgages and VA-guaranteed loans, both of which applied to old as well as new housing.

The Defense Production act amendments of 1952 provided for the continuance of real estate credit regulations until June 30, 1953, but made such control subject to new limitations. These provided that no down payment requirement in excess of 5% of the transaction price be imposed if after any three consecutive months the annual rate of construction starts seasonally adjusted falls to a level below 1,200,000 starts per year. In accordance with this mandatory provision, after certification by the secretary of labour that new nonfarm housing starts were less than a seasonally adjusted annual rate of 1,200,000 units in each of the months of June, July and August 1952, the board of governors suspended Regulation X, effective Sept. 1, including credit terms on both residential and nonresidential properties. Under instructions from the administrator of the Housing and Home Finance agency, relaxations on government-aided housing credit (covering FHA-insured mortgages, V

guaranteed home loans and farm housing loans) were also made, effective Sept. 15.

After four years of hearings, in a proceeding under the Clayton act, the board of governors ordered the Transamerica corporation to divest itself of all capital stock in a large number of banks. Governors James K. Vardaman, Jr., and Oliver S. Powell dissented from the majority opinion, and governors Abbot L. Mills, Jr., and J. L. Robertson took no part in the board's consideration of the matter. The proceeding attracted wide attention in banking circles but in effect left unsettled the status of federal reserve policy toward bank-holding companies. (See also BANKING; CONSUMER CREDIT.) (J. K. L.)

Federal Security Agency. The major units of the Federal Security agency are the public health service, Social Security administration, office of education, Food and Drug administration, and the office of vocational rehabilitation. Through them, with the direction and coordination of the administrator and his staff offices, the agency carries out its programs.

During the year 1952, the public health service went steadily ahead on various fronts. Its National Institutes of Health were conducting research into all phases of medical problems.

In heart disease, which is responsible for more than half the nation's deaths, one major development was in gaining new understanding of hardening of the arteries. Clinical tests demonstrated that the new drug primaquine is a simple, inexpensive and almost sure cure for relapsing malaria. The quest for new knowledge concerning cancer and the maximum application of what was already known for control of the disease were pursued vigorously. In the area of mental health, special attention was given to drug addiction, alcoholism, mental deficiency, emotional problems of the aging and rehabilitation of the mentally ill.

By June 1952 the new Clinical centre, part of the National Institutes of Health, was 85% constructed. When completed, the centre would provide for 500 research patients, the first ones scheduled to arrive in April 1953.

Under the Hospital Survey and Construction act, the 1,000th hospital project to be completed was formally opened on Oct. 1. The federal government had put \$500,000,000 into these hospital projects, and the states and communities had invested almost twice as much.

The first checks to show the increased payments to beneficiaries of old-age and survivors insurance, made possible under the 1952 amendments to the social security law, were mailed in October. The 4,725,000 persons then receiving such checks received \$22,000,000 more in monthly payments. Individual monthly payments were raised by \$5 or 12½%, whichever was greater, for most retired workers, with proportionate increases for dependents and survivors.

The new amendments also increased the federal share of the cost of public assistance. While fewer persons were being aided in June 1952 than in June 1951, total expenditures were higher because many states took advantage of smaller case loads to raise payments to help offset increased living costs. By June 1952, 38 states had programs of aid to the totally disabled and were making payments to 145,344 persons.

The benefits to children of the increased federal child welfare services made available under the 1950 amendments to the Social Security act became apparent during 1952.

The bureau of federal credit unions issued 581 new charters during the fiscal year ended June 30, 1952, for the establishment of new credit unions and made 3,999 examinations of existing unions.

The 82nd congress appropriated \$195,000,000 for a program

DENTAL EXAMINER inspecting children's teeth for the U.S. public health service in 1952. Data were to be used in further research on benefits resulting from the fluoridation of the water supply

of school construction projects. The office of education reserves funds to provide grants to local school districts for critically needed school buildings in "federally affected" areas, such as communities adjacent to military reservations or defense "boom towns." The total of federal funds reserved from July 15 through Sept. 15, 1952, was \$117,000,000.

In September, 312 teachers, supervisors and school administrators from 49 different countries throughout the world arrived in the United States to spend six months studying and observing U.S. educational theory and practice. The office of education co-operated with the department of state in administering this teacher-training program.

During the year, the Food and Drug administration removed from consumer channels quantities of filthy and decomposed foods. During the fiscal year ended June 30, 1952, the Food and Drug administration approved 304 applications for the manufacture of drugs. These included such significant products as radioactive drugs, blood plasma extenders and antimalarials; new therapy for tuberculosis, acute leukemia in children, alcoholism, cardiac oedema and epilepsy; and an antagonist of certain narcotics.

The federal-state program for vocational rehabilitation during the fiscal year rehabilitated nearly 64,000 disabled persons into productive and useful lives. Of these persons 12% were taken from public welfare rolls and restored to financial independence.

A three-day nation-wide joint conference of state commissions on aging and federal agencies was held early in September in Washington, D.C. The conference was called at the suggestion of several state commission chairmen who asked the Federal Security agency to undertake its organization. The agency had given increasing attention to the problems of aging. In the short period of its existence, the agency committee on aging and geriatrics had stimulated the rehabilitation and placement of older handicapped workers and encouraged research grants in several aspects of aging, such as income, housing, public service and recreation.

All parts of the Federal Security agency were engaged in one way or another in defense activities during the year. Agency-wide services were rendered the Federal Civil Defense administration. The agency represents the interests of the civilian population in obtaining critical materials, equipment and supplies for the nation's education, health and welfare. This responsibility is exercised by presenting to the Defense Production administration estimates of quantities and types of critical materials needed and by issuing construction permits and allocations of these materials for school and college buildings, libraries, hospitals and related health facilities. (See also DRUG ADMINISTRATION, U.S.; EDUCATION; EPIDEMICS AND PUBLIC HEALTH SERVICES; SOCIAL SECURITY; VOCATIONAL REHABILITATION, OFFICE OF.) (O. R. E.)

Federal Trade Commission. During the fiscal year 1951-52, the Federal Trade commission issued 104 formal complaints and 136 orders to cease and desist from violations of law. It approved 131 stipulations to discontinue unlawful practices and promulgated new trade practice rules for 11 industries. Members of its staff, working from special divisional offices set up in five large cities as well as from its main and branch offices, made inspections of the labelling practices of 12,846 establishments of wool products manufacturers and dealers throughout the United States, and beginning Aug. 9, 1952, made similar inspections of fur labelling. A total of 636,096 advertisements were examined, of which 24,416 were set aside as possibly false, distributed as follows: 287,093 in periodicals, including newspapers, magazines and trade journals, of which 13,331 were set aside; 36,627 pages of mail order catalogues, with 233 set aside; 84,325 television continuities, with 3,648 set aside; and 228,051 commercial radio broadcasts, with 7,204 set aside. One new export trade association was formed to sell anthracite coal abroad.

For almost 40 years the commission (and its predecessor, the bureau of corporations) had been collecting and establishing a vast fund of information concerning the nation's important industries. The commission had collected, and made available to other government agencies on request, information with respect to industrial operations, covering costs of production, costs of distribution, marketing methods, and profits of a large number of industries and of the leading corporations in those industries.

At the request of the Office of Price Stabilization, and with funds supplied by it, the quarterly financial reports program, published in co-operation with the Securities and Exchange commission and previously concerned with manufacturers, was temporarily expanded in 1951 and early 1952 to include information about corporations engaged in wholesale and retail trade. Under the Defense Production act and pursuant to presidential directives, the commission continued to carry on certain activities intended to minimize factors which might tend to eliminate competition or otherwise promote undue concentration of economic power incident to defense mobilization.

During 1952 the commission placed increased emphasis on procedures to encourage more general observance of the laws it administers. Its program called for simultaneous industry-wide action wherever practicable, and expansion of the corrective and co-operative phases of its work as exemplified through its trade practice and stipulation procedures.

The commission administers, in whole or part, six different statutes, including the Federal Trade Commission act, designed to prevent unfair commercial practices such as restraint of trade, concerted price fixing and false advertising; the Clayton Antitrust act, making unlawful monopolistic price dis-

crimination and other specific practices tending to monopolize the Export Trade act, excepting foreign trade associations from operation of the antitrust acts; the Wool Products Labeling act requiring disclosure of the fibre content and source of wool products; the similar Fur Products Labeling act of Aug. 1951; and the Lanham Trade-Mark act of 1946 permitting the commission to petition for cancellation of registered trademarks in violation of law. Its members in 1952 were James I. Mead, chairman, New York; Lowell B. Mason, Illinois; John Carson, Michigan; Stephen J. Spingarn, New York; and Herbert A. Carretta, Virginia. (J. M. Md.)

Federated Malay States: see MALAYA, FEDERATION OF SINGAPORE.

Fencing. The world championship tournament for women's fencing teams was held in Copenhagen, Den., July 12-14, 1952. The United States team consisted of Janice L. York, Polly Craus, Mrs. Maxine Mitchell, Bessie Aboula and Paula Sweeney. The event was won by Italy, Hungary was second, France third, Denmark fourth, the United States fifth and Great Britain sixth.

The United States national championships were held in New York city, June 13-20. The foil individual was won by Daniel Bukantz of the Fencers club of New York. The épée championship final ended in a five-way tie for first place, and after a fence-off Abelardo Menendez of Cuba was still tied with Paul Makler of the Philadelphia Fencers club. In the second fence-off Menendez won the championship. The sabre championship was won for the third straight time by Tibor Nyilas of the Salle Santelli club, New York, N.Y. The women's championship was won by Mrs. Maxine Mitchell of Alhambra, Calif.

The foil, sabre and three-weapon team championships were all won by teams from the Salle Santelli. The women's team event was won by a composite team of southern California, including Barbara Baxter, Mrs. Maxine Mitchell and Janice L. York.

The Pacific coast championships were held in Los Angeles, Calif., May 23-25. Edward Carfagno of the Los Angeles Athletic club won the foil and sabre championships and was second in the épée. Carl Shurz of the Faulkner School of Fencing, Los Angeles, Calif., won the épée title and was second in foil. Mrs. Maxine Mitchell won the women's championship. The Los Angeles Athletic club won all three of the men's team titles and the Faulkner School of Fencing won the women's team event.

DANIEL BUKANTZ of the U.S. team (right) and Norman Casmir of Germany during the second round of the Olympic foil team matches held at Helsinki, in July 1952

The midwest championships were held in Detroit, Mich., May 24-25. James Campoli of the Grosse Pointe Sword club, Grosse Pointe, Mich., won the foil championship, Albert Wolff of Louisville, Ky., won the épée and John Westley of the Illinois University club, Urbana, Ill., won the sabre. Paula Sweeney of the Salle de Tuscan (Michigan) successfully defended her women's championship.

The Intercollegiate Fencing association championships were held at Columbia university, New York city, March 14 and 15. The foil team was won by City College of New York and the épée team by New York university, New York city. New York university and Columbia shared the sabre team title. The foil individual title was won by Alfred Rubin of Columbia, Herman Wallner of New York university won the individual épée championship and Frank Zimolzak of the U.S. Naval academy, Annapolis, Md., won the sabre championship.

The National Collegiate Athletic association fencing championships were held at Yale university. Harold Goldsmith of the City College of New York won the individual foil title, Herman Wallner of New York university won the épée title and Frank Zimolzak of the U.S. Naval academy won the sabre title. Columbia won the three-weapon team championship.

The women's intercollegiate fencing championships were held at Hunter college, New York city, April 19. Hunter college won the team event, and Anne Drungis, a Hunter college girl, won the individual title. (For the winners of the fencing events in the 1952 Olympic games, see OLYMPIC GAMES.) (W. A. Dw.)

Ferguson, Homer (1889-), U.S. senator, was born at Harrison City, Pa., on Feb. 25. He studied at the University of Pittsburgh, took his law degree from the University of Michigan, Ann Arbor, in 1913 and practised law until 1929, when he became circuit judge for Wayne county, Michigan. As circuit judge and as a one-man grand jury, he received national attention for his investigation of crime and graft in Wayne county. He was elected Republican senator from Michigan in 1942 for the term 1943-49 and was re-elected in 1948 for the term expiring in 1955. In the senate he soon became known as one of the most vigorous opponents of the New Deal and the Fair Deal.

On Jan. 18, 1951, he was appointed to the senate internal security (McCarran) subcommittee and in this position frequently attacked the state department and Secretary of State Dean Acheson. He voted against sending additional U.S. troops to Europe and approved the cease-fire parleys in Korea with the proviso that there should be no appeasement of the Chinese Communists. A consistent foe of government spending, Ferguson on Sept. 18, 1951, was one of the small group of nine senators that voted to uphold Pres. Harry S. Truman's veto of a bill granting pensions to veterans for disabilities not connected with military service.

On April 16, 1952, Ferguson proposed an amendment to an appropriations bill which would forbid the president to use any of the funds to implement his seizure of the U.S. steel industry.

Fertilizers. Increased production and use of fertilizers containing the three primary plant foods, nitrogen, available phosphoric acid and available potash, had by 1952 become one of the most important international problems facing the world. Taking into account climate and rainfall, nearly all of the good tillable agricultural acres of the world were already growing crops. Population was increasing at an unprecedented rate in many countries. Unless presently cultivated acres could be made to produce greatly increased yields, there would not be enough food to go around and famine and starva-

tion would inevitably result.

The Materials Policy commission appointed by the president of the United States stated in a report in June, "Fertilizer, applied scientifically and used with other fruitful farming practices, is a cornerstone of the welfare of the Nation. It is the one single method above all others that will permit our farmers to meet our bigger future needs. Without more of it, the job cannot be done."

In 1951 the Food and Agriculture organization of the United Nations made a world-wide survey (exclusive of the U.S.S.R.) of the production and consumption of fertilizers and estimated that the total production of the three primary plant foods for the fiscal year ended June 30, 1952, would be 13,997,000 metric tons, only .7% more than had been produced in the previous year, 1950-51. It was believed that actual world production in 1951-52 slightly exceeded the F.A.O. estimate.

In the United States, one ton of commercial fertilizer containing about 22.5% in total of the three primary plant foods, if properly used in connection with other good farming practices, will produce on the average 125 bu. of corn, 85 bu. of wheat, 185 bu. of potatoes, 2 bales of cotton, 8,000 lb. of milk or 1,000 lb. of beef.

A 100-bu. crop of corn removes about 140 lb. of plant food from the acre of soil on which it grows; a 40-bu. crop of wheat removes 80 lb. of plant food; a 500-bu. crop of potatoes removes 340 lb.; and a 1½-bale crop of cotton removes 105 lb.

The soil is best looked on as a bank account into which nature placed substantial but varying amounts of the various essential plant foods to the credit of the farmers. Each crop harvested and removed from the soil is but a check drawn upon the soil bank balance of plant foods. Unless deposits are made into this soil bank account in the form of crop residues, manures and fertilizers, the account will eventually be overdrawn, the crop returns will be gradually reduced and bankruptcy (worn-out, unproductive soil) will result.

Food production is not keeping pace with population increase. In the United States alone it was estimated that by 1975 there would be 40,000,000 more people to feed than there were in 1950. The United States department of agriculture asked the fertilizer industry to supply by the year 1955 70% more nitrogen, 55% more phosphoric acid and 51% more potash to the farmers of the country than were used in the year 1951. In that year—1951—a total of 1,285,000 tons of nitrogen, 2,235,000 tons of available phosphoric acid and 1,445,000 tons of potash were used.

The goals set for the department for 1955 were 2,185,000 tons of nitrogen, 3,485,000 tons of available phosphoric acid and 2,185,000 tons of potash. Late in 1952 it appeared that the many new nitrogen-fixation plants which the National Production authority had authorized to be built would increase the nation's nitrogen production capacity sufficiently so that this goal could be met.

Certificates of necessity were issued by the NPA in 1952 up to Sept. 1 to 25 companies for the construction of additional nitrogen facilities. These certificates provided for a total increase of 1,055,600 tons in nitrogen capacity. The Defense Production administration had set a goal of 2,930,000 tons of synthetic nitrogen production by 1955. Estimated capacity for production, as of Jan. 1, 1951, was 1,639,000 tons. It was expected that about 231,500 tons of additional capacity would be constructed without the need for certificates of necessity. Likewise, two new potash mining operations together with increased imports and somewhat larger production by the older operations were expected to enable the potash goal to be met.

The increase in phosphoric acid production could not be so easily accomplished. Sulphuric acid, a principal ingredient

in the manufacture of superphosphate, the main source of available phosphoric acid, was in short supply because of the world shortage of sulphur. However, new processes for making the insoluble phosphates of phosphate rock into forms available to plants as food were under intensive research and development. One of the most promising seemed to be the use of nitric acid as a substitute, at least in part, for sulphuric acid in the acidulation of phosphate rock. Other methods under investigation employed thermal reactions. Much progress had been made and it seemed probable that the problems would be solved and the phosphoric acid goals would be met.

Certificates of necessity had been issued for the construction of several new concentrated superphosphate and nitra phosphate plants, and a number of others were under consideration or in the blueprint stage. (*See also* AGRICULTURE; BACTERIOLOGY; TENNESSEE VALLEY AUTHORITY.) (F. S. L.)

Finland. An independent republic of northern Europe, Finland has an area of 130,159 sq.mi., including the Åland Islands. Pop. (1949 census) 4,042,500; (1951 est.) 4,051,000. Capital: Helsinki; pop. (1951 census) 375,981. Other cities: Turku (Åbo) 103,899; Tampere 102,910. Language and nationality: 90% Finnish, about 10% Swedish. Religion: Lutheran Christian. President in 1952: Juho K. Paasikivi; prime minister: Urho K. Kekkonen.

The Åland Islands, a Swedish-populated archipelago belonging to Finland, lie to the southwest at the mouth of the Gulf of Bothnia. Area: 581 sq.mi. Pop. (1951 census): 22,569. Chief town: Mariehamn, pop. 3,624.

History.—For the sports-minded Finnish nation, and for the world at large, the great event of 1952 was the Olympic games (*q.v.*) in Helsinki. The games were a great success, particularly in the number of records broken and in the participation for the first time of the Soviet Union.

In the economic-political realm the achievement of the year was the final payment on the reparations account to the U.S.S.R. The reparations had originally been set at \$300,000,000 (in 1938 dollar values) to be paid over six years. The period of six years was extended to eight, and the amount was reduced to \$226,500,000. (This was approximately \$570,000,000 in 1952 values.) In order to pay the bill, the Finns had reorganized much of their economy to produce the ships, electric cable and various machinery demanded by the Russians. By Sept. 19, 1952, the job was done.

Obviously the factories built on soviet demand had to go on producing and obviously their market would be Russian; in certain sectors of its economy, Finland was tied to its great neighbour as never before. Inflation and the decline in world market prices for pulp tended to increase the dependence on the U.S.S.R.

Nevertheless the Finns continued to plan and to build for their own future. Improved communication with the sparsely settled north of Finland was envisaged. This in turn would make possible the use of both farming and forest areas so far

undeveloped, but the keynote was to be industrialization. The power station on the Oulu (Ule) river was started and was expected to produce 1,000,000,000 kw.hr. per year by 1956. Such plants, and chemical and forest industries, could hardly be built with private capital; conditions in Lapland did not permit gradual development from small beginnings. Hence the policy of the state was to eliminate the moment of risk for private capital and to create a compromise economic structure.

The triparty coalition of Agrarians, Social Democrats and Swedish People's party continued to live, in tension, held together chiefly by the impossibility of any other combination. Prime Minister Kekkonen created some controversy when, in January, he spoke in advocacy of neutrality for Denmark and Norway. This was pleasing to Moscow, and perhaps to Sweden, but not to Danes or Norwegians or to large elements in Finland. In March further difficulties arose over demands of the labour organization for lower prices on food products, especially butter. Some of Kekkonen's fellow Agrarians tried to make political capital of the problem, and the prime minister offered his resignation. This resulted in a reaffirmation and strengthening of Kekkonen's position; his stabilization policies were approved.

In March the Finnish Swedes went to the polls to elect their "people's parliament" of 60 members—a unique minority assembly which since 1919 had helped to keep Swedism alive and which had developed relations even with the government. The Swedish-speaking people of the Åland Islands experienced a series of vetoes from President Paasikivi, notably in the matter of a local flag, which the president and the supreme court thought was too much like the Swedish flag.

The foreign minister, Sakari Tuomioja, resigned in September, under pressure to return to his post as head of Finland's bank. (*See also* INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (F. D. S.)

Education.—Schools (1951): elementary 6,185, pupils 488,327, teachers 17,228; secondary (middle and lycée) 338, pupils 94,971, teachers 5,559; technical, commercial and special (1950) 457, pupils 25,867; for adults (1950) 80, pupils 3,915, teachers 769. Teachers' colleges 10, pupils 1,739, teachers 137; universities 13, students 9,273, professors and lecturers 642; other institutions of higher education 6, students 3,746, professors and lecturers 432.

Finance and Banking.—Budget: (1952 est.) revenue 171,397,000,000 markkaa, expenditure 171,357,000,000 markkaa; (1953 est.) revenue 176,917,000,000 markkaa, expenditure 176,843,000,000 markkaa. Total public debt (July 1952) 120,866,000,000 markkaa. Currency circulation (Aug. 1952) 45,800,000,000 markkaa. Gold and foreign exchange (Aug. 1952) U.S. \$176,000,000. Bank deposits (Aug. 1952) 55,700,000,000 markkaa. Monetary unit: markka with an exchange rate of 646 markkaa to the pound and 231 markkaa to the U.S. dollar.

Foreign Trade.—(1951): Imports 155,464,000,000 markkaa, exports 186,883,000,000 markkaa excluding reparations 12,396,000,000 markkaa. Main sources of imports (1951): U.K. 14%; Poland 7%; the Netherlands 7%; Denmark 5%. Main destinations of exports: U.K. 27%; U.S.S.R. 14%; U.S. 6%; the Netherlands 5%. Main imports (1951): machinery and vehicles 25%; textiles 17%; coal, petroleum and products 13%; iron, steel and manufactures 11%. Main exports: wood and manufactures 39%; wood pulp 33%; paper and products 20%.

Transport and Communications.—Roads (1950): 36,518 mi. Motor vehicles licensed (Dec. 1950): cars 26,780, commercial 34,469. Railway (1950): 3,533 mi.; passengers 43,000,000; freight net ton-miles 2,121,000,000. Shipping: vessels, 100 gross tons and over (July 1951) 344; total tonnage 555,321. Air transport (1950): passenger-miles 16,600,000; cargo net ton-miles 335,000. Telephones (1951): 328,394. Radio receiving licences (1950): 721,500.

Agriculture.—Main crops (metric tons, 1951): wheat 250,000; barley 196,000; oats 768,000; sugar, raw value 19,000; potatoes 1,481,000; flax fibre (1950) 1,000. Livestock (June 1950): cattle 1,844,000; sheep 1,330,000; pigs 470,000; horses 382,000. Fisheries: total catch (1951) 65,630 metric tons.

Industry.—Industrial establishments (1947): 5,999, persons employed 249,936. Electricity production (1951) 4,428,000,000 kw.hr. Raw materials (metric tons, 1951): pig iron 101,500; crude steel 133,200; copper smelter production 21,100. Forest products (1950): sawed softwood 875,000 standards; sawed hardwood 46,700 cu.m.; pit props 869,000 cu.m.; plywood 215,000 cu.m.; cellulose 1,194,000 metric tons; mechanical pulp 719,000 metric tons; newsprint 421,000 metric tons; other paper and paper board 350,000 metric tons.

Finletter, Thomas Knight (1893–), U.S. secretary of the air force, was born on Nov. 11 in Philadelphia, Pa. He studied at the University of

Pennsylvania, Philadelphia, where he received his bachelor's degree in 1915 and law degree in 1920, and practised law in New York city from 1920 to 1941. From 1941 to 1944 Finletter served as an adviser to the state department on international economic affairs.

He again came into public service in July 1947, when Pres. Harry S. Truman appointed him chairman of a five-man air policy commission to study aerial defense needs. The commission's report, "Survival in the Air Age," had much to do with U.S. decisions to step up research and production of both civilian and military aircraft. Finletter later served on the delegation appointed by Economic Cooperation Administrator Paul G. Hoffman to study U.S. and British productivity and distribution problems.

President Truman appointed him secretary of the air force in March 1950.

In June 1951 he warned, after a tour of Korea, that the Chinese reds were massing soviet-built planes and could be expected to step up their air operations against the U.N. forces. In July he declared that the ability of the U.S. strategic air command to deliver atomic bombs was the greatest deterrent to war.

In 1952 he continued his warnings that any substantial reduction in U.S. air force appropriations might lead to an attack by the U.S.S.R. He testified before the house of representatives' armed services committee on May 12 that \$5,000,000,000 would be needed for additional bases if the air force was to be expanded from 95 to 143 wings.

Fires and Fire Losses. Fire losses in the United States continued their ominous upward trend during 1952. Losses for the first nine months of the year totalled \$581,739,000. This was an increase of 6.1% over the first nine months of 1951 when fire losses amounted to \$548,475,000.

During 1951 there were 302 fires in the United States and Canada with individual losses of \$250,000 or more, producing an aggregate loss of \$213,310,000. Numerically, these large fire losses constituted a 24% increase over the previous year and

resulted in 40% more damage. It was an all-time record previously held by the year 1948.

Geographically, the greatest number of large losses occurred in New York (25); California was second (23), followed by Ohio (17), Pennsylvania (12) and Indiana (11).

A few major fires in 1952 occurred at warehouse M of South Dixie Warehouse, Louisville, Ky., January, total loss \$1,340,000; Cincinnati Sash and Door company plant, Cincinnati, O., January, total loss \$700,000; the Vancouver, B.C., pier fire, April, total loss \$1,370,000. (See also DISASTERS.) (L. J. A.)

Fish and Wildlife Service: see FISHERIES.

Fisheries. Fish and shellfish are sources of protein, fats, minerals and vitamins that can provide the world's undernourished population with an important portion of these food values. According to information released by the Food and Agriculture organization of the United Nations, the 1952 world production of all types of food was only sufficient to provide each person with an average of 2,260 calories daily, which was far below the minimum requirement for a healthful diet. Unfortunately, it was estimated that 60% of the world's population received an average of less than 2,250 calories each day, and in most of the countries which had an inadequate food supply, the quality of the food was also low.

The world production of fish as of 1952 was at an annual rate of about 55,000,000,000 lb. Officials of F.A.O. estimated that, by expanding facilities, this yield could be doubled without risk to the future of the resource. The catch of fishery products was being taken largely from waters over the continental shelves having a depth of 600 ft. or less, which comprise less than 10% of the total ocean area. More than 95% of the catch was being taken in the northern hemisphere. In many parts of the world the fishery industry remained relatively primitive in the light of existing scientific and engineering standards. In addition to the possibility of expanding the yield of fishery products from the sea, a large increase in yield could be derived

COUPLED OXEN hauling fishing boats to the water's edge, a Phoenician custom still common in the Portuguese coastal village of Nazaré in 1952

from fresh and brackish waters. According to an F.A.O. estimate, about 20% of the world's fish production was derived from these waters. Fortunately, large regions were available in which pond culture could be practised, including areas such as southern Asia and Egypt, where there was a great need for increased protein in the diet.

The methods used in preparation of fish for consumption varied widely in various areas, largely because of the needs of populations and the facilities available for preserving the catch and transporting it to consuming centres. Estimates prepared by the F.A.O. indicated that about 46% of the world catch of 55,000,000,000 lb. was marketed fresh and frozen. In the United States about 35% of the domestic catch was marketed in this manner. About 39% of the world catch was cured by drying, smoking and salting, while only 2% of the U.S. catch was cured. Only 5% of the world catch was used for canning, compared with 34% of the U.S. production used for this purpose. While 29% of the U.S. catch was used for reduction into oil and meal and as bait, only 10% of the world catch was used for these purposes.

The United States and Alaska catch of fish and shellfish in 1951 totalled approximately 4,400,000,000 lb. for which fishermen received an estimated \$345,000,000. The volume of the catch was about 10% less than in 1950, while the value declined about 5%. Reduced landings of pilchard and herring, because of the failure of these fish to appear in normal quantities, and of tuna as a result of marketing difficulties, were largely responsible for the decrease in production. The leading species taken during the year were: menhaden, 1,100,000,000 lb.; salmon, 400,000,000 lb.; pilchard, 325,000,000 lb.; tuna and tunalike fishes, 322,000,000 lb.; and ocean perch, 260,000,000 lb. The U.S. and Alaska catch was made by 165,000 fishermen who operated 10,500 vessels of 5 net tons and over, 48,000 motor boats and 34,000 other craft.

The fisheries of Norway set a new production record in 1951 with a yield of 3,600,000,000 lb. This figure was 25% greater than the former record established in 1948. The increase was the result of a record catch of winter herring, large catches of small and fat herring and good catches of spawning cod. Record catches of tuna were made by Norwegian fishermen during the summer of 1952. Most of the latter catch was shipped to Italy for canning.

Despite a rapidly growing population with most of its immigrants coming from countries having comparatively high per-capita fish consumption, Australia's total production of fish and shellfish was reported to be decreasing. The catch had averaged about 87,000,000 lb. in recent years, only 19% above the yield 20 years before, despite an increase of 66% in the number of fishermen operating.

Japanese fishermen continued to expand their fishing operations during 1952. A number of successful expeditions for tuna were made to equatorial and mid-Pacific areas. The first post-World War II salmon expeditions to the North Pacific exceeded the catch goals, returning with catches of more than 2,000,000 fish.

German fishing vessels resumed fishing in Greenland waters in 1952, after a lapse of 15 years. The fishing was conducted by diesel-electric trawlers which fished for bottom fish, such as cod and ocean perch. Prior to World War II, German vessels operating in the area fished hand lines for halibut.

Because of restrictions on fishing in Norwegian and Icelandic waters, British vessels conducted exploratory fishing operations in Greenland waters during 1952. Excellent catches were made, and it was considered likely that an important British fishery would develop off Greenland.

The South African pilchard industry registered a phenomenal

gain in production during 1951 with a catch of more than 600,000 lb., nearly 100% greater than the previous year's.

Although the volume of the Canadian catch of fishery products in 1951 was slightly less than in the previous year, market value established a new record of \$196,000,000.

The total production of whale oil in the antarctic in 1951-52 pelagic season amounted to 2,328,869 bbl. Production of the antarctic land stations during the 1951-52 season amounted to 144,812 bbl., bringing the total to 2,473,681 bbl., or 169 bbl. more than in the previous season. Outside the antarctic the total production in 1951 amounted to 656,426 bbl., compared with 382,699 bbl. in the previous year.

A maritime decision of major importance was rendered in 1951 when the International Court of Justice at The Hague decided that the method employed for the delimitation of fisheries zone by the Norwegian decree of July 12, 1935, was not contrary to international law. The Norwegian decree measured territorial limits from base lines running from extreme points of the coast instead of a curved line extending from the mainland three miles into the sea, measured at low water. For its determined base lines, Norway claimed a further four-mile limit as territorial waters. The British government had objected to the decree because it closed important fishing grounds to the British fishing fleets and also because it raised questions regarding the old convention of the three-mile limit for territorial waters.
